The Week.

THE President and Mr. Seward have got back to Washington, and we suppose everybody is very glad of it. Mr. Johnson ought to be, at any rate, for the curb must have been used on him severely very frequently, and more than once there was every indication of a violent runaway. As for Mr. Seward, it cannot be but that he was conscious that he was making a deplorable exhibition of himself from the time he began making speeches till he reached Annapolis. At that city, we think, he capped the climax, to use a rhetorical figure of Mr. Johnson's, for he declared that after listening to the President's touching and impressive oration, it seemed to him almost "a sacrilege" to open his mouth. The part of the Presidential oration that affected us most was the artless simplicity with which Mr. Johnson described his way of reaching right conclusions in politics—namely, "*first*, be convinced that you are right." Yet we suppose he does well to honor the means whereby he has swung round the circle, as it were, of political honor. There is not the least doubt that his firm conviction of his own infallibility had a good deal to do with making him alderman of his native village and, after he had filled other offices in the gift of his fellow-citizens, Vice-President of the United States. We may doubt, though, if he does well to regret in the least that he did not turn his attention, as he once thought of doing, to school-teaching. Seriously, he would have made a dreadful teacher. No doubt he would have been excellent in kicking in the door when the boys rebelled and barred him out, but when it came to indoctrinating the youthful mind, and doing it by soft, persuasive methods, we fear the schoolmaster would indeed have been all abroad. Postmaster-General Randall, who had no particular reputation to sustain or to lose, seems to have acquitted himself well enough. We earnestly hope that Mr. Seward and Mr. Johnson, whom the country has honored, will honor the country so far as they can by staying at home and refraining from these terrible tours.

We do not know how it is that we are reduced to telegrams for our accounts of the Surratt trial instead of being delighted with word-painting special correspondence. But, as the correspondents would say, "it is the heated term," and to seek opportunities of being graphic and eloquent with the mercury at ninety in the shade would be folly. As it is, we get little that is livelier than examinations in chief, and very often, of course, there is the dulness of cross-examination, and Messrs. Bradley and Merrick, and Surratt staring at his false friend Weichman, and the Washington secessionists scowling at the counsel for the prosecution, and encouraging the prisoner with looks and smiles—all these remain quite unsung. During the fourth week the trial has been somewhat more interesting than before, some new testimony having been offered. Weichman, who had patiently endured a vast deal of badgering from Mr. Bradley, whose bad behavior is a constant pleasure to Surratt's friends in the audience, finally retaliated by letting out a remark made by Miss Surratt on the day after the assassination, to the effect that the murder of Lincoln "was no more than the death of a nigger in the army." On the same day the proceedings were enlivened by a Doctor McMillan, who said from the witness-box that the language of Mr. Merrick was "the language of a coward and a sneak." Dr. McMillan was the surgeon of the *Peruvian*, aboard which vessel the prisoner made the voyage to Europe from Quebec in the autumn of 1865. The surgeon made his acquaintance on a boat by which the *Peruvian's* passengers were taken from Montreal to Quebec. A Catholic priest, La Pierre, had Surratt in charge, and kept him carefully under lock and key. On board the *Peruvian* "McCarty" walked about freely, and was seen talking to General Ripley, of South Carolina. The weakness of his head he made very evident in his conversations with the surgeon; he told of his trips to Richmond, of the large amount of Confederate and secret service money he had had in his possession, of his having done something that would make McMillan stare if he should know it, of his intention to kill any man who should attempt to arrest him, of the certainty that he would "swing" if ever he came back to this country, and of his desire to do for Johnson what had been done in the case of Lincoln, and a story that seems to be brag, though it may well enough be true, that on one occasion going to Richmond with four or five other persons, he met several half-starved Yankees escaping from Richmond prisons and helped to kill them. There seems to be no prospect of a speedy end of the trial, and a very fair chance that Surratt may be hanged. He seems to be unfortunate in his counsel.

Maximilian, there appears no longer any reason to doubt, has been shot. He and his friends could hardly have complained of his fate, as he had himself been guilty of the outrageous folly and cruelty of declaring war to the knife against the Liberals when he secured possession of the Government, and of treating their troops as brigands, and did execute large numbers of honest men in cold blood for the simple offence of appearing in arms against him, a foreigner, placed on the throne by a foreign army. When he did this, he, of course, placed himself on the same moral plane as Juarez, and virtually agreed that their differences should be settled Mexican fashion. Moreover, when he determined to remain behind after the French had gone, he surrendered almost all that gave him a color of legitimacy, the support and protection of the flag of a recognized and established government. This done, the consequences of defeat to himself personally might easily have been foreseen. When he fell into the hands of his enemies,

he had not a single claim on their mercy which men like them could be expected to recognize. He had himself been merciless, and he had repudiated foreign protection. Were his executioners anything but what they are, we do not know that we should much regret his fate. It would doubtless be well to have Europe taught that filibustering is as dangerous a game for princes as for ordinary men, and that scions of proud houses, as well as nameless adventurers, must, when they seek 'to wade through slaughter to a throne," be prepared to set their lives upon the cast. But, unhappily, the poor barbarians who have done this deed are not the men to give the civilized world a lesson in morality. The killing of vanquished political enemies has been their practice so long that it has ceased to indicate anything except the savage vindictiveness of the killers. We might as well ask Christendom to draw a moral from the Indian scalping and torturing on the plains as from Juarez's "military justice." M. Romero's pretence that it was necessary to take Maximilian's life in order to prevent his again laying claim to the throne is a plea which will deceive but very few. It is a plea which would justify any amount of barbarity, which has in fact been used to justify the murder of the greatest patriots, and which the sultans were at one time in the habit of putting forward as an excuse for killing all their nephews. There was about as much chance of Maximilian's coming back, had he once been driven forth a vanquished man, as of his executioners proving the wise and enlightened rulers of a free and happy country. We can hardly pity him, but it would be folly to expect anything good from them.

The New York *Times* thinks our proposal that the South should be put into the hands of the Federal officers, with their will for law, and "the only law," something rather extravagant, and asks how the powers of military officers are to be regulated at all if, as we maintain, the attempts of the South to regulate them by constitutional precedents and doctrines are absurd. It ought not to be necessary to explain that when we advocate the subjection of the South to the absolute control of military officers, it is to their absolute control *quâ* military officers. A man who uses armed force to execute his *own* will, as a man, is not a military officer, but either a chief of brigands or a despot. Federal officers cannot become absolutely free agents, so that no matter how large the powers that may be given them, they must exercise them under responsibility to their superiors—namely, the Northern people; and if there be any power or authority in existence which can overrule the Northern people in their way of reorganizing the South, we confess we have not yet heard of it and do not know where to find it. The South and Mr. Johnson have been trying for the last two years to regulate the conduct of the Federal commanders by constitutional doctrines and precedents, to institute, in fact, a mixed system of their own, and we know what the result has been. Such a system might have been possible had Southerners had imagination enough to understand their situation; but they apparently have not. The sword has never been taken from their throats for one week that they have not rushed into some folly. They are allowed to hold courts, and they forthwith refuse negro testimony or acquit murderers or robbers of negroes. They are allowed to legislate, and they forthwith proceed to patch up a negro code or keep *Harper's Weekly* out of Alabama. The greatest kindness that can be done them now is to tie them up, hand and foot, till they are fairly in the Union. It is quite true, as *The Times* says, that the South is not in Russia. If it were in Russia, instead of having its rulers laboring might and main for two years, as the North has been doing, to get it to adopt and practise republican principles, to acknowledge the equality of men, to respect freedom of speech, most of the leading Southern "statesmen" would by this time be engaged in "practical mining" or other hard labor, with their backs a little stiff from knouting; and the rest of the population, instead of being guided by Sickles and Sheridan into constitutional government, would find themselves subjected to military rule in perpetuity.

Monday last was the new North American holiday, "Dominion Day," the Dominion of Canada having on the first of the month officially begun its existence. The birth was signalized in a truly felicitous manner by Lord Monck, the Viceroy, who must have laughed in his sleeve as he took Mr. J. A. McDonald and made him into a knight. A Mr. Cartier seems to have got off more easily; he was made a simple Companion of the Bath, which is a far better dignity than the other for a man who lives so near the Yankee State of Maine and in the immediate neighborhood of the nineteenth century; it is not so mediæval and feudal in sound, and then, too, in ordinary Canadian conversation he will not be addressed as Companion of the Bath Cartier, while his friend will be compelled till death relieves him to hear himself addressed as "Sir James." He will have to travel in Europe, where they may perhaps take him for a regular knight from England or Scotland. It is not very surprising, we should say, that a part of the Halifax press celebrated the day by going into mourning. Mr. T. D'Arcy McGee invites such people in this country as feel the gross tyranny of the majority pressing upon them to go over into the Dominion, "a place of asylum where they can obtain that security denied them at home." It is possible that Mr. McGee does not dread being knighted. He talks with equal fearlessness of teaching the people of the United States what a true representative government is.

Major-General Wager Swayne has recently abrogated two characteristically Southern laws. One was a wise statute by which it was intended to make it impossible to sell *Harper's Weekly* within the limits of the State of Alabama; the other was a mild piece of legislation whose object was to make it difficult for Union soldiers to collect pensions and back pay. We suppose, then, that General Swayne's estimate of the powers belonging to his office will permit him to redress the grievances of the colored people of Mobile. Whether or not the negroes shall be, as they ask to be, enrolled among the city police, is purely a question of expediency. No one questions the right of any competent colored man to fill a policeman's or any other place, but it may not be best to give the Mobile negroes half the places in the department of police, though we should like to see the experiment tried while the military are still in Mobile. But there are grievances complained of in the petition to the general which we dare say demand immediate action, and for which it ought not to be very hard to find an immediate cure. The Civil Rights bill is disregarded, we are told, and many of the most odious provisions of the old State code are, to the great oppression of the colored people, still enforced in the courts. We dare say this is in good part due to Mr. Richard Busteed, who, we remember, did not for an unreasonably long time after the Civil Rights bill was passed take the proper action for getting it into practical operation. At the furthest, the passage of the coming declaratory act ought to mark the time for bringing matters in Mobile into better order; and it is no harm to recollect that there are white men in Mobile not of the "Conservative" persuasion who will never want for a grievance. General Swayne is, however, a discreet man.

Messrs. Boutwell, Lawrence, Williams, and Thomas are expected to present a report on impeachment at this special session of Congress. We are told by the Washington correspondent of the Boston *Advertiser*—who is usually to be relied on—that these four gentlemen will offer as the grounds of impeachment: first, the President's general disregard of properly enacted laws; next, specifications under this general head; and, finally, "two or three points showing personal corruption, one of these being in the matter of pardons." We suppose the committee are expecting that no action will be taken by the House, at any rate, till next winter, at which time the nomination of Mr. Johnson's successor will be distant, say, five or six months, and the day of election about nine. If no action is taken during the present month, none will be taken at the next session, that seems quite certain, and the report of the committee will become a historical document, but will hardly be of much weight legally or politically. The rumor is not worth regarding, as we suppose, which asserts that it is the intention of certain leaders to remove Mr. Johnson for the sake of making Mr. Wade the incumbent of his seat, so as to increase the chances of the latter gentleman for the regular nomination. We are well persuaded, at all events, that whoever is cherishing intentions of that kind may as well resign

himself to certain disappointment. We have so often gone over the objections to having an impeachment trial—objection sthat have grown weightier since last there was occasion to urge them—that we have nothing to offer now by way of argument. It is sufficient to know—and, in order to know it, it is only necessary to read the newspapers and to hear people talk in the streets—that the question of impeachment is not at all a practical question, and may profitably be disregarded entirely. There can be no doubt, from the utterances of the press at large, that Congress cannot please the country more than by giving Mr. Stanbery a declaratory act which he cannot get over or under or through, by letting everything else carefully alone, and by going home as speedily as possible. And there is good hope that this is what will be done.

The Labor Convention which has been sitting for the last week at Albany had a "Committee on Good" which occupied itself mainly in providing work for the Constitutional Convention, which, it is evidently the opinion of the working-men, ought to leave as little for the Legislature to do as possible. The committee reported resolutions calling on the Convention to insert in the constitution a provision prohibiting the employment in factories of children under ten years of age; another requiring all corporations to pay their operatives weekly and not monthly. Individual members then proposed that the constitution should prohibit anybody under eighteen years of age working in cotton or woollen factories more than eight hours a day. For the first of these prohibitions there is a great deal to be said, but if the constitution is to regulate matters of this kind it ought not to stop there. It ought to contain a complete code, both political and moral and sanitary—tell us what to eat, drink, avoid, hope, fear, and believe. There is one suggestion which we regret to see the "Committee on Good" omitted to make, but which we trust it will in justice to its own character yet make, and that is, that the constitution forbid all knaves and evil-disposed persons from residing in the State of New York more than thirty days after the next election. This measure might seem to some arbitrary, and even cruel, but when we consider the sweep and thoroughness of the reform that would be thus effected we cannot help hoping that no maudlin sympathy with the wicked would be allowed to stand in the way of its adoption. A bill is now before the English House of Commons, introduced by the ministry, forbidding the employment of any child under eight year olds in any "handicraft;" or of any child under thirteen for more than six hours and a half a day, or earlier than six in the morning or later than eight at night; or of any person, male or female, under eighteen, for more than twelve hours, minus one hour and a half at least for meals and rest.

Mr. Greeley has been examined by the Judiciary Committee of the House touching his motives in bailing Jefferson Davis. Immediately after the bailing his course was defended by some of his friends on the ground that his appearance as bondsman, though not apparently was really necessary to secure Davis's liberation, inasmuch as it was well understood that nothing but the participation of some leading Northern man in the performance would induce Mr. Johnson to permit it. Mr. Greeley testifies, however, that he had no reason to suppose that his action would produce any influence whatever on the Government, that he had no understanding with any member of it on the subject, and never spoke to any member of the Cabinet about it except Mr. Speed. Mr. Speed did not give him even a hint of what he or the President thought of doing. Mr. Greeley's chief and only instigator was, in fact, his "intimate friend and acquaintance, Mr. George Shea;" so that his position remains just what the public supposed it to be.

On Friday last two men, William King and Abram Owens, were hanged at Franklin, Ky., with formalities that give one a pleasant notion of that region. At nine o'clock in the morning five ministers visited the jail and exhorted the prisoners and prayed with them. Then the two men were taken down-stairs and dressed in black coats and trousers, lasting shoes, white gloves, and straw hats. Their hands were tied, a running noose of grass-rope three-quarters of an inch in diameter was put round the neck of each, lighted cigars were given them, and they set out for the gallows, which was at a little distance from the town. The local pride of the people of Franklin in their two murderers was exhibited in the arrangements for the procession more strikingly than in the costumes provided for the occasion. First came a brass band, next a military company, next the prisoners and sheriffs, next a wagon containing two coffins, next citizen guards, next the clergymen on foot, and finally "the citizens, male and female." The band played a funeral march all the way to the gallows, and the condemned men continually called to their friends in the crowd, and exhorted them to meet them in heaven. The number of spectators—men, women, and children—was very great. When the place of execution was reached "the sheriff introduced Captain King to the immense crowd," and he made a long speech, the substance of which, in his nervous excitement, he repeated many times. "This is my last speech," he said, among other things; "in two hours from now I hope I will be with my father in heaven. I am to die for the death of my brother. No one ever loved a brother better than I did that murdered boy. Had I known his murderer, I should not have said yea or nay, but I should have killed him." He died protesting his innocence, and so did his companion, though doubtless both were guilty. King lived no less than twenty-two minutes after the drop fell, the complaisant sheriff having, at his request, so arranged the noose that the neck should not be broken. An account of a more revolting execution we do not at present remember, and the simple recital of occurrences like this one ought, we should think, to do more to increase the number of people who oppose capital punishment than all M. Victor Hugo's rhetoric, and the increase will be quite as legitimate in the one case as the other.

Napoleon has achieved the greatest triumph of modern times. He has got the Sultan to Paris and carried him round the Great Exposition in his train, the Sultan no doubt feeling, as the Doge of Genoa felt at Versailles, that the most wonderful thing in all the display was his being there himself. To most Parisians he is chiefly remarkable as a monarch who has an unlimited number of wives, and who is reported to be in the habit of drowning the court beauties when they behave badly. The great Cable newsman, in trying, in his inarticulate way, to do him honor, has invented for him the title of "His Sublime Majesty." The newsman has probably been tempted into this outburst of reverence by the circumstance that it has long been the diplomatic custom to style the Ottoman Government the "Sublime Porte," literally the sublime gate of the palace—just as we speak of St. James's or the Tuileries as a synonym for the French or English Government. The Sultan's title in Europe has always been the "Grand Seignor" (Venetian) or the "Grand Turk" (English), or, in modern times, "His Imperial Majesty the Sultan." We venture to say, however, that if the Cable newsman will speak of him in his despatches as simply "the Sultan," nine out of ten of us will know what he means.

This same newsman of the Associated Press seems, like the unfortunate man who cut his throat the other day in St. Peter's, to be nearly driven crazy by "the pomp and glitter and lights" of the ceremonies and festivities which he has now to describe every day. The military review at Satory and the Ascot races were near being too much for his feeble reason; but it seems to have fairly succumbed under the Pontifical High Mass celebrated at Rome in honor of the eighteen hundredth anniversary of St. Peter's martyrdom. At the close of a column of hysterical description of that gorgeous scene he burst into a kind of incoherent canticle, as irreverent as ridiculous, and which the editors of the great dailies ought really to have stricken out of the poor man's despatch. He tried to be sublime and religious, and only succeeded in being foolish and incomprehensible, when informing us of his own feelings when he saw the Host elevated, and "the priests and nobles, peasantry and soldiers, kneeling to earth to do reverence to the *Higher than the Highest!*" etc., etc. This is really disgraceful, and we once more call the attention of the city press to the matter.

Notes.

LITERARY.

THE dull season is fully upon us, and there is little to mention this week in the way of new announcements. Leypoldt & Holt will reprint an English book, the subject of which would seem to ally it with the volumes of their co-operative library now in course of publication. It is "The Progress of the Working Classes from 1832 to 1857," by John Malcolm Ludlow and Lloyd Jones.——Messrs. George Routledge & Sons announce a very cheap edition of the collected works of Bulwer, of which seven volumes are now ready.——Messrs. T. B. Peterson & Brothers have bought of Mrs. Henry Wood the right to publish in this country, in advance of its publication in England, the novel "Orville College."——The first volume of Messrs. Ticknor & Fields's reprint of the "Charles Dickens Edition" of Dickens's works will be out almost immediately.——Announcements by J. B. Lippincott & Co., which we have not previously mentioned, are "Melpomene Divina; or, Poems on Christian Themes," by Christopher Laomedon Pindar, a writer of whom we know nothing; "Sleep and its Derangements," by Dr. William A. Hammond; "Randolph Gordon, and Other Stories," by "Ouida;" "Eugene Aram," which will be the third volume of the excellent "Globe Edition" of Bulwer's novels; "The Farmer's and Planter's Encyclopædia of Rural Affairs," which is the work of Cuthbert W. Johnson, F.R.S., adapted to the United States by Gouverneur Emerson; and "Hanna's Ready Reckoner," which is a little book of tables giving the cubic contents of any possible stick of square or unequal sided timber.——Messrs. Clark & Bowron, of Chicago, announce that they will publish in quick succession twelve volumes—or what we take to be twelve volumes—in prose and verse, from the pen of Thomas Clarke. Dr. Clarke is a British gentleman who woos the muse in Chicago. Some of his poems are already in their sixth edition. The publishers say that all the works of Professor Clarke, which they are going to publish in the fall, "are of the deepest interest and the highest order of merit." These are their titles: "The Battle, and Other Poems, Patriotic and Humorous;" "Demetrius; or, The Conspirators: A Tragedy in five acts;" "The Aminta: A Sylvan Drama, translated from the Italian of Torquato Tasso;" "Miscellaneous Poems," "A Pastoral and Other Poems" (reprinted from the London edition); "Donna Rosa and the Silent Village" (reprinted); "A Day in May" (reprinted). All these are in verse; we have seen none of them, but we take the risk of saying that they are not extremely good. Two poems of Mr. Clarke's we have seen, namely, "The Two Angels" and "Sir Copp," which means "Sir Copperhead." As we have passed what may seem an unfavorable judgment on these works, it is fair to say that the publishers have information that "no book, since the days of Hudibras, has produced so great a sensation as 'Sir Copp.'" The forthcoming prose works by the same author are "Philip Thornton; or, The Adventurers;" "Life in the West," "The New Sentimental Journey," "Lectures and Essays," and "Miscellaneous Pieces."

—In default of a critical notice in these columns of the new novel, "Beauseincourt," we lay before the public an appreciative word from the gentleman who criticised it for *The Louisville Journal*. He remarks generally that it is the best novel ever published in America, and the best novel ever published in English by a woman, and then coming to particulars he speaks thus warmly of the leading character:

"Bertie is unsurpassable. Her character must have been wafted to Mrs. Warfield by some 'stray breath of Sapphic song which blew through Mytelene.' I can see the *petite* form of this little splinter of lightning, the moonlight on her tawny hair, incipient madness in her unutterable eyes, and the great taint of blood expanding her quivering nostrils as she comes from the park where the gibbering thing moans and whines over its deadly melons. That lily lagoon too is grand when the crazed Ajax splashes and paddles under the unearthly glimmer of the yellow lightning, and the hot bolt dries the blood on his soul. . . . Gregory is splendidly drawn. . . . Colonel Levigne is a towering figure."

We do not know whether a man can in earnest be so "genial" as this critic, but we suppose the thing is possible. As for his eloquence, it is such as to range Kentucky by the side of Tennessee, who claims Mr. Tenney, the Fourth-of-July orator from whom we recently quoted.

—One could hardly desire a better text-book than Prof. Laboulaye's "History of the United States," of which a second edition was published in Paris a year ago, and of which we are now reminded by seeing it on the shelves of Mr. F. W. Christern, 863 Broadway. The work is in two volumes, and consists of lectures delivered by the author from his chair in the Collége de France in 1849 and 1863–4. The first volume treats in detail of the colonies before the Revolution, the circumstances of their settlement, the character of their founders, and the peculiarities of the charter of each one. The second discusses the causes of the Revolution, the united action of the colonies, the confederation, and the train of events reaching to the peace of 1783. A third volume gives the history of the Constitution. M. Laboulaye, as he recently told an American, reads more English than he does French, and we may guess from this fact, as we may learn from his book, how thoroughly he has devoted himself to the study of American institutions. We do not know of a manual of American history which we should prefer to this, as a teacher; for one reason, because what seemed perfection in our government in 1849 is just now in debate, and nothing can be more instructive than to examine the arguments in its favor offered ten years before the rebellion by an acute and impartial observer. Besides, it is in the light of foreign criticism that we often understand not only best but first our own manners, principles even; and Prof. Laboulaye is for us in France what Prof. Goldwin Smith is in England, an admirer not blind but hearty. Between these two there is also a very close parallel in their attachment to religious liberty and in their appreciation of character as the basis of self-government and national advancement.

—Mr. Robert Lowe, who was a contemporary of Mr. Gladstone's at Oxford, and, as may be believed, a young man of great promise, was unable, on account of want of fortune, to enter at once, as Mr. Gladstone did, the field of politics. He therefore betook himself to Australia and the practice of the law, and, having acquired wealth, returned some years since to the mother country to find his former acquaintance the leading English statesman. He entered Parliament; and it is fresh in everybody's memory how he suddenly distinguished himself as a bitter opponent of Mr. Gladstone's Reform bill, an excellent debater, and master of an eloquence at once polished, sharp, and strong, which his enemies cannot help admiring while they fear it. They will not be sorry that an Australian bookmaker has shown them the vulnerable heel of this dangerous warrior. It appears that while a colonist Mr. Lowe contributed poetry to the Sydney *Atlas*, and some of his verses have been incorporated into a work compiled by Mr. G. B. Barton and entitled "The Poets and Prose Writers of New South Wales." We are not informed of the subject of the poem of which we copy from *The Spectator* this stanza:

"Yet still did I speed
On my way without heed,
Nor mourned for the wreck that was doing;
For my calm, cold light
Is my own delight,
And I smile o'er the ashes of ruin."

Distance in space is as good for some purposes as distance in time. Mr. Lowe away at the antipodes seems to have been like a bard of ancient ages, only half a versifier perhaps, but at least one half a prophet. It would be much in Mr. Disraeli's way to define Mr. Lowe's present political position in Mr. Lowe's own language. But then, too, Mr. Disraeli has some literary indiscretions of his own behind him.

—We are informed by Messrs. Leypoldt & Holt that two hundred and fifty is the number of new subscribers which the Early English Text Society want before they begin to reprint their publications of 1864 and 1865 now out of print. Though we believe a great number of these already are, and the rest are very soon to be secured, we willingly remind owners of libraries, students of English literature, book-purchasing committees of public libraries, and the book-reading and book-buying public generally of the value and interest of the society's books. We see it told in the literary gossip of *The Athenæum* that the society now have in press a versified (alliterative) translation, never before printed, of Joseph of Exeter's Chronicle. To judge by an extract from his work given by *The Athenæum*, the translator held in its fulness the mediæval faith in the authenticity and accuracy of the "pragmatic" histories of Dares Phrygius and Dictys Cretensis. If we recollect that Dictys kept—or says he kept, which is the same thing—a journal of the leading events of the Trojan war, that he makes no mention of gods and goddesses interfering in battles, but relates the truth as an eye-witness ought and can, that to his own authority he adds that of Idomeneus and Meriones, at whose request he wrote out his journal and published it, we shall be the better able to understand why our translator pours contempt on the unfortunate Homer. Virgil and Ovid, it will be seen, he regards as writers of veracity—Ovid honest, as he says, and Virgil virtuous. Thus he exposes the trifling and deceitful Melesigenes:

"He feyned myche fals was neuer before wroght,
And traiet the truth; trust ye non other.
Of his trifule to telle I haue no time nowe,
Ne of his feynet face that he fore with,
Howe goddes foght in the field, folke as thai were,
And other errors vnable that after were knowen,
That poeytis of prise haue preuyt vntrew,
Ouid and other that onest were ay
Virgilf the virtuus verrit for nobill.
Thes dampnyt his dedys and for dull [deceit] holdyn."

We may add here, as an item of news that may be of interest to some of our readers, that the newly formed Spenser Society intend to begin their labors by publishing, in quarto, the works of J. Heywood, and for their second and third issues will give the complete works of Taylor, the water poet, and of Gascoigne.

—An English Shakespearean, Mr. George Russell French, believes that he has discovered "the long missing link which really unites Shakespeare with the ancient family of Arden of Warwickshire;" or, as one might say, which unites the ancient family of Arden of Warwickshire with Shakespeare. The connection, it appears, was made out by guesswork before, though it is true, too, says Mr. French, that "the late Mr. Hunter very nearly made this discovery" which Mr. French is so well pleased to put beyond doubt. Malone, and many biographers of the poet who follow Malone, say that Mary Arden, the mother of the poet, was the daughter of Robert Arden, of Wilmecote, who was the son of another Robert, who again was the son of a Robert, who was younger brother of Sir John Arden, Kt., Esquire for the body to King Henry VII., which two were sons of Walter Arden, who was a recognized descendant of Ailwen, the Saxon sheriff of Warwick in the time of Edward the Confessor. But Mr. French has discovered that a certain freehold estate in Warwickshire, which Robert Arden in 1550 settled on his six daughters, was purchased in 1501 by Robert Arden *and his father*. Now, Mr. Halliwell, in the course of his researches, found that in the sixteenth year of the reign of Henry VII. (1501) an estate in Warwickshire was conveyed to certain other persons "*et Thomæ Ardern* et *Roberto Ardern filio ejusdem Thomæ*." So, then, it seems that the grandfather of Shakespeare's mother was called not Robert, but Thomas Arden. Dugdale and Drummond Mr. French finds defective in some particulars; but with the aid of other genealogical authorities he is able to trace the poet's pedigree back without a break to the Saxon sheriff Ailwen, and in a forthcoming work he will be able, being assisted by one of the Staffordshire Ardens, to bring the table of the pedigree of the old family down to the present day, and of the Hartes from the poet's sister down to the same period. He expects, furthermore, to be able to identify all the dramatic personages of the historical plays, and is probably justified in thinking that his book will make an addition of appreciable value to Shakespearean literature.

—The influence of marriage on the death-rate is pretty well understood to be favorable. Just how favorable it is in Scotland we learn from a report on the subject made to the Royal Society of Edinburgh by Dr. Stark, who draws his conclusions from the returns of nine years deposited in the office of the Registrar-General. In general, it may be said that the death-rate is higher among men than among women, and a good deal higher among unmarried men than benedicts. Taking one hundred thousand Scotchmen between the ages of 20 and 25, if they are married men 597 of them will die in the course of a year; but if they are not married the mortality will be almost twice as great—1,174. Of the same number of men between the ages of 30 and 35, the number of deaths annually among the married will be 907, among the unmarried 1,475. As we go on among the older men, the disparity between the yearly number of deaths among the two classes is not so great, but it is still great, and the advantage—though, to be sure, a constantly decreasing one—remains with the married till we come to men of eighty and ninety years, terms beyond which it is not worth while to go. A hundred thousand married men, between 40 and 45 years old, lose by the deaths of a twelvemonth 1,248 men; the same number of unmarried men of the same age lose 1,689. In the five years between 60 and 65, 3,385 of the married die, 4,330 of the unmarried; in the five years between 70 and 75, the figures stand for the married 8,055, for the unmarried 10,143; in the five years between 80 and 85, there are 17,400 deaths among the married men, and among the unmarried 19,688. The mean age at death of the men comprehended in the figures given above would be, of the married 59½, of the single no more than 40 years. It is not, then, remarkable, in view of these statistics, that even the picked single men of the army and navy are far distanced by the married civilian in the matter of expectation of life.

—The opening of the new art building at Yale College, which takes place on the 10th, is an event of some significance, its effect on the public taste considered. The merits of this particular exhibition may not be great, though a large number of pictures have been contributed from New York and elsewhere, but the constant presence of a good, even if small, collection, cannot fail to educate the students of the College in the first place, and next will afford the citizens of New Haven, and the country people who make their way thither in the course of the year, a familiar acquaintance with art such as is enjoyed only by the largest cities, and by not all of these. We hope this example will be imitated in other collegiate towns, and in towns which are larger and more central than these are apt to be.

THE DEFINITE RESULTS OF EGYPTOLOGY.*

After an interval of seven years the concluding volume of Bunsen's history appears in an English dress, both the author and the translator meantime having passed away. Nearly twenty years have elapsed since the publication of the first volume (1848), and American buyers must now pay $31 for the fifth alone, almost as much as the estimated cost of the whole work. This volume contains a summary of results from the entire field of discussion, a translation of the Egyptian "Book of the Dead," a dictionary and grammar of hieroglyphics, with selected Egyptian texts in the form of a chrestomathy, and an appendix of fragments of Philo.

The great value of Bunsen's work consists in the discussion of Egyptian history in its relations to the history of mankind and the application of linguistic science, the philosophy of religion, and general archæology to the solution of its problems. While some of his speculations are fanciful and his conclusions arbitrary, there is much in his method that deserves commendation, and his industry and zeal were above praise. He adopts the computations of Eratosthenes to correct the chronology of Manetho, and, as a result, gives for the date of Menes 3059 B.C., Abraham in Canaan 2314 B.C., the Exodus 1320 B.C. It is too early yet to pronounce with confidence upon these numbers, since the chronology of Egypt is now undergoing a process of sifting, and the best scholars are not agreed in their conclusions. Without following our author in details, we will glance at some of the more general and definite results of Egyptology as represented by his work.

The claim of Egyptology to be ranked among the sciences was vigorously contested by the late Sir George Cornewall Lewis in his "Historical Survey of the Astronomy of the Ancients." Setting aside Manetho's lists of Egyptian kings and dynasties as "a royal phantasmagoria, without the bone and muscle of history," discarding, also, the lists handed down by the classical authors as in great part imaginary or fabulous, that critic regarded the chronological schemes of Lepsius, Bunsen, and other prominent Egyptologers as purely conjectural—an attempt "to transmute legend into history." Nor had he any confidence in the reading of the hieroglyphic inscriptions and the conclusions that Egyptologers have drawn from them. "The meagreness of the historical information which Bunsen and Brugsch profess to have derived from the hieroglyphic inscriptions must be apparent," said Lewis, "to every reader of the hieroglyphical writings which have been interpreted correctly, and if they may be taken as a sample of the rest, we may be satisfied that there is nothing worth knowing, and, it may be feared, that the future discoveries of the Egyptologers will be attended with results as worthless and as uncertain as those which have hitherto attended their ill-requited and barren labors." If this judgment was correct, some of the most laborious and conscientious scholarship of our time has been utterly wasted.

Almost every science in its infancy has been obnoxious to the charge of crude and extravagant theorizing; but it must be admitted that the field of Egyptology has been remarkably fruitful in arbitrary conjectures and chimerical theories. Of late years, however, the results of the labors of scholars in this department have been far more definite and satisfactory, and their methods no longer empirical, but truly scientific. Without attempting to popularize the processes, we will give a brief summary of the more important of these results.

First in order is the placing Champollion's system of hieroglyphic interpretation upon sure and solid grounds. The clue to that interpretation furnished by the Rosetta Stone has been followed by the deciphering of a great variety of monuments through "the collation of hieroglyphic texts containing the same subject matter with each other and with the *hieratic* manuscripts" (in which by rapid writing the hieroglyphics of the monument were reduced almost to a cursive hand, afterwards still further simplified in the *demotic*), and especially through the collation of the phonetic signs of the old Egyptian with Coptic words of like signification. The basis of this system of interpretation is the division of the hieroglyphs into two classes—*ideographs*, or those representing ideas, and *phonetics*, or those employed for sounds; and its method has been verified by the fact that different scholars have thereby come at the same results in deciphering independently the same texts—as, for instance, the translations of the stele of Rameses XII. in the Louvre, by several Egyptologers laboring apart, concur in the interpretation with a remarkable uniformity.

A striking confirmation of the method of interpretation pursued by the school of Champollion has been obtained from the discovery at Tanis of a bilingual inscription much longer and more perfect than that of the Rosetta

* "Egypt's Place in Universal History. An Historical Investigation, in five Books. By C. C. J. Baron Bunsen, D.Ph., D.C.L., D.D. Translated from the German by Charles H. Cottrell, Esq., M.A., with additions by Samuel Birch, LL.D." Vol. V. London: Longmans, Green & Co. 1867.

Stone. This discovery was due to the researches of Dr. Lepsius, during his visit to Lower Egypt, in the early part of 1866. The inscription belongs to the ninth year of Ptolemy III., Euergetes I., about 239 B.C., and is therefore nearly forty years earlier than the Rosetta Stone. It is in praise of the king and his queen, Berenice, for their pious and beneficent deeds and their successful foreign wars, and is composed of thirty-seven lines of hieroglyphics, followed by a Greek translation in seventy-six lines. This inscription is valuable for the light which it throws incidentally upon the Egyptian calendar. But its chief worth is philological; for since both texts are complete, and their subject-matter is well understood from contemporaneous historical sources, the Tanis Stone is a test of the interpretation consequent upon the discovery of the Rosetta Stone, and the confirmation which it brings to many of the conclusions of Egyptologers establishes the interpretation of hieroglyphics as a science whose leading principles are well understood and whose general results are sound. This inscription has been published at Berlin by Dr. Lepsius, in a beautiful folio entitled "Das bilingue Dekret von Kanopus," and at Vienna by Messrs. S. Leo Reinisch and E. Robert Roesler, in a neat octavo, "Die Zweisprachige Inschrift von Tanis."

The attention of Egyptologers is now much given to the preparation of scientific helps to the study and interpretation of the hieroglyphics. Among these may be mentioned as of special value the "Dictionary of Hieroglyphics, with the Hieroglyphic Grammar and Chrestomathy," prepared by Dr. Samuel Birch, of the British Museum, and incorporated with this fifth volume of "Egypt's Place in Universal History;" Vicomte de Rougé's "Chrestomathie Egyptienne," published by A. Franck, of Paris; and Dr. Brugsch's "Hieroglyphisch-Demotisches Wörterbuch," now issuing in numbers from the press of Hinrich at Leipzig.

With the positive and definite results already obtained from the system of hieroglyphic interpretation employed by the best Egyptologers, and the scientific apparatus now provided for the application of that system to monuments not yet deciphered, so far from distrusting with Sir G. C. Lewis the interpretation of hieroglyphics as ambiguous, and rejecting its results as worthless, one may rather believe with Dr. Birch that many of the Egyptian papyri "are as trustworthy as the best classical manuscripts of the Middle Ages," and that "the interpretation of the extinct languages of Egypt and Central Asia will ever rank as one of the distinguishing features of the nineteenth century."

Next in importance among the definite results of Egyptological research is the revision of Manetho's lists by the monumental tablets, so that the historical order of the early kings of Egypt is well-nigh complete. This is due mainly to the discovery, in 1860, by M. Mariette, of a list of the kings of the second and third dynasties, registered in a tomb at Sakkarah, and known as the "Tablet of Memphis or Sakkarah;" and the no less valuable discovery in 1866 by Mr. Dümichen of the "Sethos Tablet," at Abydos, which gives nearly all the kings of the first dynasty, and supplies many *lacunæ* in the lists of Manetho and in the well-known Tablet of Abydos. Upon the Tablet of Sethos I., that monarch, accompanied by his son Rameses, is represented as rendering homage to his royal predecessors, from Menes downward. The list numbers seventy-six cartouches, and so far as the names admit verification they are arranged in a strictly historical order. The first four dynasties as recorded upon these newly-discovered monuments differ materially from the list of Manetho as preserved by Africanus, but agree more nearly with the list of Eratosthenes, to which both Bunsen and Rougé resort for the correction of Manetho; and the tablets of Memphis and Sethos accord so minutely with each other and with the fragmentary list of the Turin papyrus that the combined authority of these three documents will hardly be disputed. Thus the problem of the historical succession of the kings of Egypt approaches its solution; the data for its final determination are becoming more settled; and when these royal lists shall have been definitely made out, the chronology of the Egyptian empire may be at least proximately ascertained. The probabilities are that the received chronology of the Old Testament, especially for the period from the creation to the time of Abraham, will require to be much extended, though by no means to the degree conjectured by Bunsen and other extremists.

Another result of Egyptological research is the unfolding of the theological and philosophical belief of the ancient Egyptians, especially through the study of the "Funereal Ritual, or Book of the Dead." This remarkable production has been almost a sealed book, partly because of its mystical character, and partly because of the intrinsic difficulties of its construction. Within the past three years, however, great advances have been made toward a full understanding of the design and meaning of the ritual, and the attention of Egyptologers is likely to be concentrated upon it until its contents shall be fully mastered.

The Vicomte de Rougé is now publishing a superb folio edition of "The Ritual," based upon the Turin papyrus, and collated with the papyri of the Louvre. This is accompanied with a partial translation and commentary. Dr. Reinisch, of Vienna, has written a valuable monograph upon the Egyptian funereal monuments in the collection of the Archduke Maximilian at Miramar; Mons. Chabas, Mr. Brugsch, the late Dr. Hincks, and others have furnished translations of important chapters of "The Ritual;" and, within a few weeks, Dr. Samuel Birch has published a translation of the entire book, which is incorporated with Vol. V. of Bunsen's "Egypt's Place in Universal History." Although many passages of the book are still obscure, yet as a key to the religious belief of the Egyptians it possesses a marvellous interest. The original unity and eternity of the Supreme Being, the creation of the world and of all existences by his almighty power, the immortality of the soul, and a future state of rewards and punishments—these and like dogmas found in documents which antedate the sojourn of the Hebrews in Egypt give to the early faith of the Egyptians a remarkable significance among the religions of antiquity. Indeed, one may distinctly trace the influence of the Egyptian belief concerning Elysium and Hades upon the faith of the Greeks and other later nations; and, according to Dr. Birch, the descriptions of Hades in the 149th chapter of the "Book of the Dead," "give an esoteric notion of the nature of the regions of the damned rivalling the cold Hades of a Homer or the hotter hell of a Dante or a Milton."

It does not lie within the province of this article to enumerate the more palpable results of what may be called the pictorial department of Egyptology—the knowledge of manners, customs, arts, rites, wars, buildings, castes, races, etc., derived from the decorations of tombs, palaces, and monuments. But this brief outline of what has been accomplished in interpreting language, in determining history and chronology, and in unfolding religious faith by purely scientific methods, must vindicate the claim of Egyptology to a place among the sciences; and we may indulge the hope that American scholarship will be represented in this field as successfully as in the departments of philology and of the physical sciences.

THE INVISIBLES.*

THE book before us must be judged, though it need not be approached, on the plane of spiritualism. It assumes that there is an after-life, that the departed can and do revisit their old haunts, and give unmistakable signs of their presence, and that they are, in fact, the cause of the phenomena which are attributed to them. Many persons will only need to read the first chapter—a narrative of personal experience—to pronounce the author insane, and to throw down the volume. They will do him a double wrong. Instead of being the crowning example of the pernicious effects of spiritualism upon the human understanding, they will find him, if they will but read to the end, a cautious, well-balanced, sagacious observer, and the most formidable critic that spiritualists have yet had—spiritualism we might have said in place of spiritualists; but the author contends that the spirits have borrowed their theories from the brains of their votaries. Where he diverges from the latter is in the secondary, not the primary, inductions from the phenomena which both acknowledge as real; but this divergence is, the question of immortality apart, fundamental, as respects the practical value of spiritualism or our knowledge of the life to come. Sense he opposes to their nonsense, positiveness (a great quality, even when mistaken) to their vagueness, consistency, finally, to their inconsistency.

We have not a suspicion who the author is. He allows us to know that he is a native of Ohio, and now, or till recently, a banker in this city. From his style, which is very perspicuous but not always grammatical—chiefly when the predicate nominative or accusative and the future tense are to be used—we infer that he is not a practised writer. Of his reading we can only judge within the limited sphere of his subject, and there it seems to have been extensive and discriminating. He is undoubtedly a remarkable "medium"—one, he says, whom the higher class of spirits would consent to employ as their interpreter on earth. His narrative begins in 1863, and his conflict with those spirits whom he does not hesitate to denominate "devils," and who sought to use him for their own purposes, has not apparently terminated to this day. We shall say no more of his experience than that it was very extraordinary, that he pursued his investigations in solitude, and that, by sheer force of will and strength of mind, he succeeded, he says, in opening a communication with his mother and other relatives, who imparted to him as well as they were able, amid great opposition, explanations which confound the doctrines of "circles" hitherto thought to be "well-informed." The deceptions through which he struggled to this fountain-head of truth are

* "The Invisibles: an Explanation of Phenomena commonly called Spiritual." Philadelphia: J. B. Lippincott & Co. 1867. Pp. 331.

the same, he declares, by which thousands are constantly cheated, *i. e.*, personations by unscrupulous spirits of all sorts of characters, according to their convenience—generally of the dead, but sometimes of the living. How he could be certain that after all he was not dealing with a personation, and that his authority for his theory is not another lying angel, the author does not disclose.

The lower class of spirits, he says, are more magnetic than the upper, and can under ordinary circumstances bar them from mundane intercourse. Even should the latter triumph for a moment, they would know that immediately on their withdrawal their friends would be exposed to the grossest deception by their rivals, partly in revenge and partly because the truth is not in these creatures. They have power to influence the mind to believe in their assertions, to confuse the brain, and prevent independent thinking. They spend most of their time here among the mediums, having a much more decided affinity for their former than their present mode of existence. In other times they used to find vent for their earthiness in hauntings and the like; since a Yankee girl had the wit to exorcise them with the alphabet, they have in great measure abandoned the ruder demonstrations. "Only the lowest, vilest, and most unintellectual of the other world have hitherto been able to acquire any considerable control of any one of our world;" and it is "always a devil in control of a medium." Hence the flatness and narrow commonplaceness of their "messages." Spirits in general see the material objects about us imperfectly. They cannot read writing, but they do—which answers the same end—the mind of the writer; nor the title-page of a book. With great difficulty some of his persecutors deciphered the number of a store on Broadway, of which the figures were eight inches high. Our atmosphere is dark to them, and they cannot readily discern where their friends are. In our darkness they see best. They cannot read each other's minds. They have not the gift of prophecy, and can never foresee an event which has not taken place. By reading our minds they can form a more or less accurate judgment of the future from our intentions, and they can impress this judgment, as if an actual occurrence, upon the minds of others.

The invisibles are "spirits" only by courtesy. Their bodies are as substantial as our own, and composed of the same matter. This is true also of their world as compared with ours, the difference between which "consists simply in a different combination or crystallization of the particles of matter." Yet their two substances pass through each other without obstruction. The invisible world extends from the centre of the earth to the verge of our atmosphere, and upon its surface is the proper abode of the departed, so that "heaven" has a mean distance from us of about forty-five miles. But it is not reached at a bound. The popular and spiritual notion of a disembodied spirit, which has an airy but still definite form, and that a somewhat improved likeness of the corporeal, is erroneous. The other world is peopled as the earth was gradually stocked with species—by reproduction from the spiritual germ. Neither Darwin nor Chambers, nor yet the theologian with his "special creation," is right. The races of living things are repeated and perpetuated by natural generation, but each species has in itself the germ of a higher which fructifies only upon the death of the animal, and again only in favorable conditions. Man may possibly thus be the offspring of the monkey, who preceded him on the earth, for this theory permits gaps in the order of the creation which are found (but not satisfactorily accounted for) in the Darwinian sequence. After death, continues our author, the human germ remains half an hour without sign of life, at least to the perception of the spirits. In three days it reaches its former stage of development—if youthful, youthful still; if mature, equally mature. As to the seat of the germ in our body there is no speculation, nor is the pineal gland alluded to. One, purely logical, criticism on this theory suggests itself. The author says he is far from certain that man is the highest animal destined to appear on our globe. If this be so, why have not the lower animals their invisible world for continued existence so long as conditions here are unfavorable to their development into new species? But we are told that their germs perish in such circumstances.

For an ingenious explanation of the various spiritual phenomena, we must refer the reader to the book itself. The author maintains that they have never taken place without the presence of a medium, and many of them—such as certain dreams, the vision of apparitions, etc.—he explains without the *deus ex machinâ*. It is from this latter standpoint especially, and from an unqualified denial of the coexistence of a spiritual with our fleshy body, which it occasionally deserts for a time, that he examines some of the most inexplicable stories that fill the pages of Howitt and Robert Dale Owen ("Footfalls on the Boundary of Another World"). Probably no single work on spiritualism has had so much influence with intellectual minds as that whose title we have just given, but we do not hesitate to say that its argument and its facts are powerfully shaken by the judicial acumen of this nameless critic, who candidly selects those examples which he confesses his theory fails to embrace. In this case he usually, and with good reason, casts doubt upon the narrative. Whether satisfactory or not, the whole chapter is replete with interest, and does credit to the ability and fairness of the author.

NOTES ON THE NEW EDITION OF WEBSTER'S DICTIONARY.

NO. XVII.

Calk.—Supposed to be from Fr. *calfater*, which is referred to Arabic *galafa*. It is difficult to believe that cal*k* could be derived from cal*f*ater; and if we admit the possibility of such a deduction, we are still met by the improbability of the introduction of an Arabic word into all the European languages, to denote an operation familiar to all Europe before the Arabs or their arts were known to Western civilization. Engelmann, a high authority, believes *calfater* to be derived from Lat. *calefacere, calefactare*, on account of the application of heat in *calking*, or perhaps rather in the accompanying operation of paying, and he thinks that a similar Arabic verb has been borrowed from the European word, not from a native root. Be this as it may, it is capable of documentary proof that the Latin *calcare* was employed in the Middle Ages in the precise sense of *to calk*, and there is therefore a strong presumption that Wedgwood is right in deriving the English *to calk* from the former verb.

Calcare, literally to tread or press with the heel, *calx*, was employed by the ancients in senses closely analogous, though, so far as I know, not identical with E. to *calk;* nor does Du Cange cite any case where *calcare* is so used in M. L. But in a contract of the year 1248, printed in the "Documenti Inediti riguardanti le due Crociate di Ludovico IX.," now in course of publication at Genoa, I find: "Ego martinus calafatus de lembregaria promitto . . . . *calcare* navem tuam . . . . de omni labore pertinenti ad calafatiam" (p. 35); and in a note on the same page, the editor, Belgrano, cites from the eighth book of Guido de Vigevano, "De modo acquirendi et expugnandi terram sanctam," this passage: "Postea fortiter inclaveletur navis super curvis illis, et postea *calchentur* stopino cum cuniis et maciis."

It is probable that our English verb came from the Latin through the French, but there is some difficulty in making out the historical connection, and this arises from the fact that, as first employed, *calfatage* included both *paying* and *calking*, and the various words indicating these different operations seem to have been used almost indiscriminately. The difficulty is increased by the fact that the Old French *calquer* and *chausser* may both be legitimately derived either from *calcare*, to *calk*, or from *calx*, in the sense of lime, which substance was one of the ingredients of a composition used for *paying*. The earliest English example known to me—that in Palsgrave—appears to be equally comprehensive in meaning: "I *calke* a shyppe or bote with towe and pytche, *or* I make them cleane. *Je calfetre.*" The different French texts of Marco Polo give both forms of the verb, *calquer* and *chausser* (*chaucier*), and they, as well as the earliest Italian translation, expressly mention lime mixed with oil and tow or hemp as a material employed in China, instead of pitch, for paying ships. It appears from Lord Macartney's narrative that this practice is still continued in that country. (See Marco Polo, Pauthier's edition, Paris, 1865, p. 535; also the same traveller, in Ramusio, II. 49, *b*, and in the Magliabecchi text, Florence, 1865, pp. 232, 233. See also, *post*, my note on *Pay*, to pitch.)

Camlet.—The Oriental form of this word, *khamlat*, indicates clearly that it is not allied to *camel*, but is derived from a different root, and there are several cognate words, such as *khamail, khamilat*, etc., which are applied only to silk, velvet, or other soft and lustrous fabrics, whether watered or plain. In the early European examples of this word, it signifies similar tissues, as will be seen by the citations collected in my note on *camlet* in the American edition of Wedgwood. Camel's hair is not and never was the raw material of *camlet*, nor is *camlet* necessarily waving or undulated in surface. Belon, edition of 1588, p. 373, describes this stuff as woven from the wool of the Angora goat, and says that *camlets* (*chamelotz*) may be "ondez ou sans ondez," watered or plain.

The error as to the origin of this word has arisen partly from a hasty deduction from apparent similarity of form between our modern spelling *camlet* and *camel*, and partly from a confusion between *camlet* and *camelin*, which latter was a very cheap fabric of coarse wool, possibly mixed with camel's hair. *Camlet*, or, as it was formerly written, in accordance with etymology, *chamlet*, is usually enumerated among the finest and costliest tissues, though it is not always discriminated from *camelin;* and on the other hand *camelin* is sometimes employed where *camlet* is meant. Thus, St. Louis ordered Joinville to purchase a hundred pieces of *camelin* of differ-

ent colors, "to give to the Cordeliers when we should come again to France." This must have been the coarse fabric, for the Cordeliers wore no other. See Joinville, edition of Michaud and Poujoulat, p. 297. On the other hand, in a passage on p. 179 of the same volume, a man of humble origin is blamed for abandoning the simple dress of his father, and wearing "a richer *camelin* than the king himself," while on page 184 the king is spoken of as dressed in "une cote de *chamelot*." Probably the confusion is in part due to the carelessness of copyists, and in any event, whatever may be the origin of the word *camelin, camlet* is certainly not cognate with *camel*. In a note on p. 188 of F. Michel's edition of Joinville, Paris, 1859, the editor notices the distinction between the two words, and refers to his "Récherches sur le commerce, la fabrication et l'usage des étoffes de soie," etc., Vol. II., pp. 48–51, but I have not been able to consult that work.

Can (or *gan*), began, in Old English. In many if not most of the cases where this word occurs, it has lost its original meaning, and has become a simple auxiliary or sign of the past tense corresponding to our present use of *did*. In the passage cited from Spenser,

"With gentle words he *can* her fairly greet,"

the sense is not, he *began* to greet her, but simply he greeted or did greet her.

Carafe.—This is an Oriental word, and is in all probability the same as *carboy*, which, as I have shown in the note on the latter word in the American edition of Wedgwood, is indisputably Persian.

Carboy.—See note in the American edition of Wedgwood.

Caster.—A phial or cruet for condiments; a set of rude cruets; a frame containing a set of casters; a small wheel or roller on which frames or sets of casters were mounted, the name being afterwards transferred to similar rollers or swivels for bedsteads, chairs, sofas, and the like.

I have never met with any attempt to explain the origin of this word, but two etymologies occur to me as possible. Sets or stands of *casters* were often made in the general form of a mediæval *castle*, and such may still be seen in old sets of table silver. *Castle* would easily be corrupted into *caster*, and the name of the stand transferred to both the single phials and the rollers on which the whole apparatus was moved.

I prefer, however, a different derivation. Phials with perforated tops, like the present pepper-cruets, were used in the sixteenth and following centuries for sprinkling rose-water and other fluid perfumes, and were called "*casting* bottles." The form and mode of using being substantially the same, vessels for condiments naturally took the same name. This name, in the form of a *set of casters*, was next applied to the frame or stand which contained the phials, and finally to the rollers on which such frames were mounted. The subsequent application of the same designation to similar rollers for other pieces of furniture is perfectly natural.

Admitting this derivation to be the true one, as I have no doubt it is, it is a good illustration both of the caprices of etymology and of the importance of attention to the actual history of words. By what I have called transcendental etymology—the theoretical deduction of forms and meanings from known or supposed roots of special significance—we could never have learned that a roller, swivel, or cylindrical wheel for a sofa took its name from that of a phial used for sprinkling apartments, clothing, and other objects with perfumed water; but when we trace the biography of the word, we find that its descent from its supposed ancestor, and all its changes of meaning, are perfectly legitimate.

Cater, to cut in a diagonal direction. For this word and its definition Halliwell is cited, but the phrase *to cut catering*, though very common in New England, especially with reference to cutting cloth obliquely, is not noticed by the editors of Webster or by Bartlett. I have often heard it pronounced *quartering*, a form which suggests a possible, perhaps a probable, etymology for the word. Palsgrave, p. 829, col. a, has *a katerwayng* as an adverbial phrase, and gives *agars*—a word which I have not met with in French literature or lexicons, but which is probably the Celtic *gwyr*, across—as the French equivalent. It is highly probable that the first element in *katerwayng* is the same as the more modern *cater*. Worcester quotes Carr's "Craven Dialect" as authority for *catty* or *cater*-cornered, diagonal, and observes, as is indeed the fact, that this expression is common in the United States.

Clapper, an enclosed place for rabbits to burrow in. This word the editors derive from Fr. *se clapir*, to squat, to conceal one's self. Cotgrave's definition of Fr. *clapier*, "a heap of stones whereunto they [the coneys] retire themselves," is considered by Wedgwood, and I have no doubt rightly, as suggesting the true etymology. Wherever French or Gallo-Italic dialects are spoken on the flanks of the Alps, and even in Dauphiné and Provence, *clapier, clapié, clapé, clapeira*, etc., is the general name for heaps of stone, and especially for large accumulations of rocks which have fallen from the mountains, and are favorite retreats of the wild rabbit, hare, or coney. The M. L. *claperiam, claperia*, had before the fourteenth century this meaning only, though later it acquired that of the Fr. *clapier*. (See Littré.) The root of *clapier* is *clap*, which in several of those dialects signifies a stone, or a hard lump.

A Painter's Camp. By Philip Gilbert Hamerton. In Three Books. Book I. in England, Book II. in Scotland, Book III. in France. (Boston: Roberts Brothers. 1867.)—Mr. Hamerton published in 1862 a book in two volumes, and rather complex in nature, called "A Painter's Camp in the Highlands, and Thoughts about Art." The first volume contained the record of his experiences in trying to paint minutely and accurately from nature, with the aid of an ingenious hut with plate-glass windows, and a surpassingly safe and steady double-tube boat, on whose broad deck the hut was sometimes set up. The second volume was devoted to essays upon topics connected with the fine arts. More recently, the author has separated this work into two, avowing his previous wish to try to float the "Thoughts" by tacking them to the adventures and experiences of the "Camp." The book before us is a reprint of the more popular and generally interesting part. To the matter of the first volume is added several interesting chapters about some aspects of life in France not often touched upon by travellers who write for the public. The whole is an unusually interesting book of travel, with enough generally well-put discussion of art to benefit decidedly those who will read it.

The careful word-pictures of scenery are very interesting. They are not poetical, and therefore not wholly satisfactory, but they are suggestive. Mr. Hamerton has for a long time been a purely topographical painter with the brush, and here has tried to practise his art with the pen. These and his poem, "The Isles of Loch Awe," show the painter to us who have never seen any of his own handiwork on paper or canvas.

In this book, at least, he shows to better advantage as a shrewd and kindly observer of life and manners than in any other way. He is not, and does not try to be, profound; but he is a liberal-minded Englishman, and sees things that his countrymen do not often see, and sees that they do not see them. His chapters about Burgundy and Sens are very good reading, slight and unimportant as they are, and though he has told so little of the much he might have told, what he has told may be taken as very accurately true, and not colored by the spectacles of nationality and language. It will be well if those who read and enjoy this book are induced by it to read the author's much more important writings upon the fine arts, many of which are very valuable. They are so little entertaining that few persons not painters seem to care for his papers in the last volume of *The Art Journal*, for instance; but painters like them very much, and all who care for pictures may get instruction from them.

Emanuel Swedenborg as a Philosopher and Man of Science. By Rudolph Leonard Tafel, P.D. (Chicago: E. B. Myers & Chandler.)—We said, two months ago, in reviewing the theological works of Swedenborg, that "no one familiar with his books can doubt that they furnish to future speculation—religious, scientific, or philosophic—a storehouse of facts and experiences inestimably precious." The aim of the volume before us is to establish this proposition in its last two divisions. Curiously enough the editor—we cannot call him author—has adopted the plan of simply reprinting his scrap-book, as it were, in which he has for years been gathering every testimony to the greatness of Swedenborg. To the common mind the impression would have been quite as strong if Dr. Tafel had contented himself with publishing the chapter in which he catalogues his subject's writings, and which no person can read without doing homage to so universal a mind. Indeed, when one considers the paucity of the followers of Swedenborg, and the almost universal conception of him as a theological leader like Calvin and Wesley and Fox, it is something to make it known that he invented the air-tight stove, let alone other discoveries attributed to him in physiology, astronomy, medicine, chemical physics, etc., etc. We cannot help thinking, however, that the effect of this summary of opinion is seriously impaired by the want of discrimination in putting it together. Let us confess that, whether of persons or of periodicals, an opinion delivered twenty years ago is not, in the domain of science, unquestionable authority, since something has probably been learned in the interval; and let us further doubt the prudence of advocating the superiority of Swedenborg by saying that, as he predicted, "the sciences *were* carried to the tomb, where they *now* are buried, with the mind their subject, in the small dust of modern experience"! And is science, albeit truly in these days "infinite division," "a mist of hypotheses crawling along the ground, and making every step uncer-

tain and perilous"? Or again, such truisms as this—a not surprising conclusion for a review written in 1845—what value have they now for confirmation, enlightenment, or conviction?—"We honestly declare that, be its merits [Swedenborg's *Animal Kingdom*] great or none, or in whatever intermediate category it be placed, it stands alone amid scientific writings, and is a monument, at any rate, of the persistent daring and originality of Swedenborg."

It is also unfortunate for Dr. Tafel's purpose that he allows glimpses of the excess of some disciples in claiming originality for their master. He is himself obliged to call to account one of his principal contributors, Mr. Beswick, when he asserts with confidence that Swedenborg declared the composition of air, whereas if you grant him his oxygen, his nitrogen is not beyond dispute—which reminds us that this instance, like several others, proves that obscurity which the compiler denies does attach to the doctrines of Swedenborg. You cannot have a difference of interpretation without obscurity, and the moment there arises this difference, it is easier to insist on your view than to get it respected. Concerning this whole controversy as to what Swedenborg taught, understood, or foreshadowed, the remarks of F. W. Robertson are worth recalling:

"Much of the beauty that is laid to Shakespeare's charge is too far-fetched to have been intended by him. Mrs. Jameson errs in this respect, and so do the Germans. . . . Such critics do with Shakespeare what Swedenborg did with the Bible—inform it with themselves and their own sentiments and philosophy; or as the wolf did with Baron Munchausen's horse, began at his tail, and ate into him until the Baron drove the wolf home, harnessed in the skin of the horse. Certainly Shakespeare was 'a million-minded man,' if he was conscious of the innumerable philosophies and psychological truths which his million critics have found in every trifling word and sentence."

Dr. Tafel announces a future complete American edition of Swedenborg's works. If they are as beautifully and correctly printed as this forerunner, they will be a creditable addition to any library.

Liber Librorum: Its Structure, Limitations, and Purposes. A Friendly Communication to a reluctant Sceptic. (New York: Charles Scribner & Co. 1867.)—A religious book without a Latin title will soon be a rarity if the rage for this novelty continues. We have had "Ecce Homo" and "Ecce Deus" and "Deus Homo" and "Credibilia," and now we have "Liber Librorum." It is a good "dodge," and cheats the newspapers out of one-half their advertisements. There is evidently a good deal in a name despite the ancient question. Had the title of this book been simply "The Bible," it would probably not have sold so well as it now does by one-half. It is an earnest, anxious, and, in the main, good-tempered book. But it gets very much enraged with ritualism, and hits at it very hard. It has more patience with scepticism than with Papal tendencies. It takes for granted what is very commonly denied, that the scepticism of the present is not wilful and outrageous, but reluctant and religious. The author is probably an Anglican churchman of the Broad Church type. The writers whom he quotes with greatest favor are Stanley, Maurice, and others of their stripe of thought. But, though an Anglican, he seems to be no lover of the Established Church as at present organized, and, in a note to his work, argues at some length in favor of a separation of the Episcopal Church from the state, and the establishment of a new national church upon the basis of "the Apostles' Creed and such portions of the Book of Common Prayer as are in harmony therewith." Upon the question of Biblical inspiration, with which our author principally deals, he takes a middle ground. Defending, on the one hand, the supreme authority of the Scriptures in respect to all questions of religious faith, and insisting on their permanent and indispensable superiority above all other books as composed by men divinely aided and inspired; on the other hand, he argues that the "bibliolatry" which idolizes the letter of the Scriptures is against the claims of the Scriptures themselves, and rejects "the narrowness of that theological dogmatism" which puts its own meanings into the language of the Bible, and insists that they were there from the beginning. The book has evidently been prepared in haste; it is not written carefully. There are some things which the author had better settle for himself before attempting to assist the doubts of others. To the solution of the problems of the time its contribution is scarcely appreciable. But its earnestness may well be copied, and its candor ought certainly to be commended.

The Romance of the Age. By Edward E. Dunbar. (New York: D. Appleton & Co.)—Mr. Dunbar succeeds better in his narration than in his philosophic and pious reflections, and his narrative itself would be better if it kept a closer grip upon its subject. But the booklet is interesting and its object is excellent. It seeks, by a short biography of John A. Sutter, the Californian pioneer, now old and poor, to awaken a patriotic, generous, and practical sympathy for him in the hearts of the thousands who are sharing the splendid and substantial results of his discovery. To this end it tells in undress English how Captain Sutter, after the failure (through Providential causes) of his Swiss colony in Missouri, struck for California by way of New Mexico, Oregon, and the Sandwich Islands; then, against great obstacles of man and elements, built his fort near Sacramento—there, with his cattle and corn, liberally relieving the starved emigrant bands and giving livelihood to hundreds in his mills and fields; the lord of a broad territory, which was roamed by his beeves and mules and swine and sheep in thousands; the commander of a national fort; then, when the gold invasion burst in, robbed of all his stock, deserted by his hundreds of workmen, disappointed in his immense crops, and at length driven from his very home; afterwards paying enormous costs to recover his property from the thousand lawless squatters, but at the last appeal suffering judgment against himself for the better half of it; then losing all the remainder in making good his warrantees upon the portion decreed away from him. With this narrative are interwoven chapters on the English and the Mormon attempts upon California, just five minutes behind the universal Yankees; on the establishment of the Pacific line of steamers just at the critical moment, and the trials and perils of the first trip.

Carmina Yalensia. A complete and accurate collection of Yale College songs, with piano accompaniment. Compiled and arranged by Ferd. V. D. Garretson. (New York: Taintor Brothers.)—The only other collection of college songs with which we are familiar is one published in 1860 by Russell & Tolman, of Boston, and compiled by a student of Harvard College. University pride could not make Harvard a singing *Burschenschaft*, and only 17 songs were claimed for the institution by Mr. Stevens. To Yale he allotted 19, and to Williams and Dartmouth about 10 each. In Mr. Garretson's narrower but more voluminous list we find nearly 100 songs, though by no means all representing as many different tunes. Four of them are among the seventeen that Harvard has appropriated as peculiar to herself, and fourteen are found in the Yale department of the Tolman edition. From the not infrequent exchange of students between the two colleges, it is not surprising that certain songs should be naturalized in both. The "Carmina" is very clearly printed and very substantially bound, and we should think would meet with a ready sale in the colleges of all the States. We need not say that, except in the Latin songs, neither of the collections we have been comparing has anything in common with the delightful "Commersbuch" of the German students.

A Political Manual for 1866 *and* 1867. By Edward McPherson, Clerk of the United States House of Representatives. (Washington. 1867.)—In announcing this compilation we bore witness to the industry and impartiality of the editor, and now that the work is out "we have the honor," in mercantile parlance, "to confirm our last." Executive, Legislative, Judicial, Politico-military, and General Facts, which could be included between the dates April 15, 1865 (ever memorable!), and April 1, 1867, are here recorded and classified, and whoever wishes to vote intelligently on State or national questions will here find material for correct judgment of men and parties. The President and his administration are fully delineated; the reconstructed States "as they were" and reconstruction as it is, the resolutions of conventions, the votes of States, the opinions of the Supreme Court on *habeas corpus*, the test oath, and the Mississippi injunction case, find their proper place in the contents. Since there is no light like the light of facts, when diffused among an intelligent and thinking people, we are glad to hear of the widespread circulation of this manual, especially at the South.

Dime Hand-Book of Riding and Driving. (New York: Beadle & Co.)—We suppose if hand-books of riding are to be sold for ten cents, no American publisher, though he may have his hand-book "prepared expressly for the Dime series," will do anything more costly than have it "prepared" by borrowing right and left from English treatises on the subjects. That these are not precisely adapted to all the wants of the American rider, that our school of riding is, in several important particulars, different from the English, everybody knows, but no one would guess that the fact is so from looking over this little work. It is, however, good of its kind, and the chapter on "Female Horsemanship" is adapted to the needs of our country women as well as of their cousins across the water.

A Manual of the Law of Fixtures. By John W. Hill, counsellor-at-law. (New York: Baker, Voorhis & Co. 1867.)—In this little book we find a very neatly arranged statement of the elementary principles of the law of fixtures, showing, by reference to the leading cases, what articles are deemed fixtures so as to pass with the land, as between heir and executor, landlord and tenant, etc. It is not intended as a substitute for the larger treatises on the subject, but will be found very useful to the student, and to lawyers who desire in a few words an exposition of the principal rules of American law upon the points involved.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

THE NEW TYPE OF STATESMAN.

AN amusing account of a visit to Senator Wade, at his home at Ashtabula, Ohio, appeared the other day in the Cincinnati *Commercial*, and has been widely copied, describing that gentleman's personal habits, mode of life, tastes, peculiarities, opinions, and expectations, and winding up with a cordial recommendation of him for the Presidency. Mr. Wade has now been for some time talked of for this office, and the letter in *The Commercial*, besides being an entertaining piece of personal gossip, is undoubtedly also a contribution to the usual work of preparing the public for his nomination—a kind of work which is done for candidate after candidate with the most singular simplicity and earnestness, although it hardly ever produces any result. We notice the letter, therefore, not because we believe it, or anything like it, can seriously affect Mr. Wade's political fortunes one way or the other, but because it contains an excellent sketch of a type of statesman which, though it would perhaps be inaccurate to call it new, is every year becoming more and more pronounced. The production of this type is partly due to a reaction against the European ideal of the public man, which prevailed during the earlier stage of the Government, and which held sway till within a few years—the polished, regularly educated, cautious, somewhat timid, formal, punctilious, rather unsympathetic personage, precise in his language, careful in his dress, distrustful of popular enthusiasm, and strongly influenced by the traditions and tone of thought of old societies. With one or two exceptions the presidential chair and the prominent offices of Government were filled by such men down to 1860. They were all Eastern men, or Western men of the Eastern type, bred in Eastern habits of thought and moulded by Eastern standards of propriety, however plain or simple their lives or humble their origin.

It is partly due also to the immense and rapid growth of the West during the last twenty years—a growth which has ended, as everybody now sees and acknowledges, in the departure of political power from the Eastern States, and which has for some years back been communicating to the language, manners, and thought of the political world in Washington what, from the "genteel" point of view, might be called a worse tone, but which we shall content ourselves with calling a rougher, freer tone—a tone marked by all but complete disregard of the Old World measures of excellence or desirableness. It is due also in some degree to the long absorption of the public in the anti-slavery struggle—a struggle so entirely moral in its nature that moral excellence—in other words, fidelity to principle—was, during its existence, almost the only excellence exacted of politicians in the Republican party. Training or knowledge of political science was of little or very inferior importance.

The new type first made its appearance distinctly and unmistakably in Mr. Lincoln. The Eastern public has undergone so many greater shocks since then, and he himself proved such a transcendent moral and mental success, that people have forgotten the disagreeableness of the impression made by his manners and looks when he first presented himself to the world as the President elect. They have forgotten, too, the painful surprise occasioned by the revelations which were made during the first year of his term of office of his total ignorance of conventional rules, and, in fact, of all knowledge of "the world" beyond what may be acquired in an Illinois village. He *grew* so rapidly, however, his grasp of great principles was so firm, the issues he had to meet were so simple, direct, and clear cut, his tone of mind was so elevated, and his written and spoken style had so much of that greatest of all marks of high cultivation, directness and simplicity, that long before he died his mental defects were more than forgiven and overlooked. In fact, by a process of reasoning which is very old, and in politics very common, his good qualities came to be regarded not as the results of natural force, but as the consequences of the peculiarities of his early training. A vague impression was diffused before he died that a youth passed in rail-splitting or working flat-boats was not simply a valuable experience, but a very good, if not the best, preparation for the presidency. Regular training in schools or in cultivated society began to fall into disrepute, and, in spite of the testimony to the value of education offered by the war, there can hardly be a doubt that we came out of it with somewhat diminished reverence for schools and books on the part of a large number of persons.

During the year 1865 we began to hear, for the first time in American history, expressions of contempt for education as a qualification for political duties from Northern orators, lecturers, and clergymen, and glorifications of common sense and the "natural man" in terms very like those used by Southern revilers of "free society" in old times. When Mr. Johnson was elected to the Vice-Presidency, he was himself so impressed with the political value of his early ignorance and obscurity that he publicly bragged of it at the inauguration, and we all remember how, during the following year, he dosed us with accounts of it. His career has, however, done much to cause a reaction. He has succeeded in making people doubt whether it is a good thing for a possible President to reach years of discretion without knowing how to read, and whether the company within the reach of an ignorant working tailor is, after all, the kind of social influence which is best fitted to shape the character of a man who has to manage, even for four years, the affairs of a great people. In fact, we are getting back to our earlier and better faith, that nobody who is to fill a high official position can have too much at the outset of his career of every kind of influence that softens, civilizes, enlightens, and refines. Many of the influences of Western and Southwestern life are hardening and strengthening; but it is safe to say that there is nothing the typical American character needs less than hardening or strengthening. It is strong and hard in its very fibre; it is full of push and energy. These things are now inbred in the American nature, and there is, therefore, no need whatever that boys destined for a political career should pass their most teachable age as deck-hands or farm-laborers. The one valuable thing which men acquire from lowly beginnings is sympathy with poverty and friendlessness; but, constituted as American society is, it is safe to say that no man will ever attain high political positions who has not got this, or does not successfully affect it.

We learn from the correspondent of *The Commercial* that Mr. Wade loves to tell long stories of his early cattle-driving, canal-digging, and wood-chopping, and he "passes hours" in this improving occupation during the Congressional vacation. His library consists entirely of public documents, maps, and charts of the United States, so that of the wisdom there is to be found in Congressional debates and reports of Congressional committees we may be sure he is full. He reads the Cincinnati papers, the New York *Tribune*, *Independent*, and the Cleveland *Leader* carefully, we suppose to correct and clarify what he gets out of the "public documents." His other periodical reading is *The Westminster Review* and *Harper's Monthly*. "Mother Goose" was recently purchased for him by his wife, and he was so delighted with it that he learnt it all by heart. He also likes Nasby's letters, but keeps these for perusal in the family circle. He swears frightfully when in a rage, but always apologizes for "any wrong done unintentionally." He hates butter and grease, is fond of sport, and had only seven days' schooling in his life. This some people may think was a great disadvantage to him; but that would be an antiquated fallacy, inasmuch as at the age of twenty-one, mark you, "he had read a vast number of books, mastered Euclid, and was *well versed in philosophy and science*." Nor was this the result of hard, unintermitted study without the aid of a master. On the contrary, it was accomplished by a young man who was engaged all day in the heaviest physical toil, and whose reading of the Bible even had to be performed in the evening by the light of pine torches. No wonder the correspondent pronounces him "the best informed man now in public life in this country." Algebra he found very difficult, but he "mastered it," though working on a farm at the time, and though he had "to read it over fifty times without understanding it," and though he used to

spend hours when following the plough thinking over the algebraic signs "without being able to make anything out of them." A man who, without the aid of a teacher, and in hours snatched from hard manual labor, makes himself "well versed in philosophy and science" before the age of twenty-one, may well be believed to stand higher than any of his countrymen in the realms of knowledge, and to be conscious of his superiority. But Mr. Wade acknowledges that even he has not reached the top of the glorious tree; in its very "flowering crest" who should be perched, according to him, but Horace Greeley, and "he," says Mr. Wade, "has *more knowledge on all subjects* than any man in this country!"

As neither of these great lights ever received any regular training of any kind, and as Mr. Wade's difficulties with algebra and the present quality of his literary pursuits show that he is not a person of extraordinary powers, it is no wonder that there is a widespread belief that school and college training in youth is not only not necessary for politicians, but it is not necessary for anybody. What Messrs. Greeley and Wade accomplished in the intervals of physical labor ordinary boys may very well accomplish by an occasional use of their leisure, without any master. In view of their accomplishments, what can be more useless and absurd than the regular educational machinery?

One other advantage which, in the opinion of a large class, "self-taught men" have over the poor hot-house plants produced in the schools and colleges, is that they are almost all, like Mr. Wade, "original thinkers"—that is, they make wonderful discoveries and produce new and startling ideas. As a general rule, it is true, whatever is valuable in their discoveries has been known for ages, but then this does not lessen the credit due to them for lighting upon it, and the consciousness which they all the while carry along with them that they are the first explorers of an unknown region naturally develops in them the bold and energetic cast of mind with which we are made so familiar in Congressional debates and reports of Congressional committees, and to which we owe so many startling novelties in finance, political economy, and, in fact, in the whole science of politics. The poor, educated man, on the contrary, goes crawling along, demoralized by the proofs which his pitiless instructors every day lay before him of the vastness of the field of truth which other men and other ages have laid open, and is soon overpowered by a horrible sense of his own feebleness and deficiencies. If he goes into public life, therefore, he is either made timid and cautious by what he knows of the result of the experiments recorded in history, or by his familiarity with great principles evolved by the working of other minds, and approaches great questions with a feeble and faltering step. The self-taught man, however, like Mr. Wade, takes any bull he meets by the horns, mounts the stump, and disposes of the most puzzling problems, such as the relations of labor and capital, in a few sentences. No wonder "he is considered one of our grandest public men." We ought not to pass from Mr. Wade, however, without complimenting him on his magnanimity in calling the co-operative system "Mr. Greeley's plan." This generosity of great minds towards each other is very touching, but it is right to say that the co-operative system is as much Mr. Greeley's plan as the application of steam to inland navigation. He is, we believe, a friend of both plans; but the co-operative system, like the steam-engine, was known and had been worked in various parts of the world while Mr. Greeley was still struggling in the earlier stages of the art of walking.

We find in the report on the organization of the new Cornell University, by Mr. Andrew D. White, the following startling passage; speaking of the necessity of a department of "jurisprudence, political and social science, and history," he says:

> "We believe that the state and nation are constantly injured by their chosen servants, who lack the simplest rudiments of knowledge which such a department could supply. No one can stand in any legislative position and not be struck with the frequent want in men, otherwise strong and keen, of the simplest knowledge of the principles essential to the public welfare. Of technical knowledge of law and of practical acquaintance with business the supply is always plentiful; but it is very common that in deciding great public questions exploded errors in political and social science are revamped, fundamental principles of law disregarded, and the plainest teachings of history ignored."

What *can* he mean?

THE WORKING-MEN AND POLITICIANS.

Mr. Wade has denied to the correspondent of the Cincinnati *Commercial* that, when he said "that property was not equally divided, and a more equal distribution of capital must be wrought out, that the Congress which had done so much for the slave cannot quietly regard the terrible distinction between the man that labors and him that does not," he meant that a more equal distribution of property ought to be made by legislation. Of this, he says, he perceives the absurdity as clearly as anybody. On being pressed by the correspondent, however, for a remedy for the state of things which he deplored, he said he had no very distinct idea of any remedy, but thought, on the whole, co-operation was the best. The discovery of this remedy he ascribed to Mr. Horace Greeley, and as he savagely abused "Conservatives" in his speech at Lawrence for their indifference to the cause of the working-man, we are bound to presume that he believes "Conservatives" to be opposed to co-operation, which will be new to the rest of the public.

Many people will be satisfied with this explanation, and it is a pity it did not come sooner, but it is hardly sufficient. There are many ways of grossly violating private rights, under pretence of helping the working-classes, without providing for a redistribution of goods. Mr. Wade does not say that he is opposed to legislative interference under any form with the relations of labor and capital. On the contrary, the analogy, as regards the case they present for Congressional interference, which he drew between the condition of Southern slaves and that of the working-men, warranted and still warrants us in believing that he thinks that not only may the legislature regulate labor, but Congress may do it. And yet nothing can be more mischievous or more unfortunate than for public men to entertain or encourage any such idea. There is no question that the working-man's condition cannot and ought not to remain what it now is; that the traces of servitude which ages of ignorance and oppression have left in it must ere long be removed; and that the condemnation of the larger proportion of the population of every country to constant toil for fixed wages, and those wages very little greater than are sufficient to supply coarse food and coarse clothing, which the present hiring system involves, must cease, if real progress is to be made in civilization. The world has in the last hundred years made enormous advances in its producing power, and the means of enjoyment, both physical and mental, have been greatly increased; but only a very small portion of the resulting advantages have fallen to the lot of the working-classes.

Now, it cannot be too often repeated that all change for the better in their position must come from themselves. Nothing but a miracle would ever permanently increase their well-being except an increase in their share of the products of industry, and this increase can only come either from a decrease in their numbers in proportion to the quantity of capital seeking investment, or from a successful combination amongst themselves not to work for less than a certain rate of wages. Anybody who tells them that there are other means than these of raising their wages, is either talking of what he does not understand or seeking to impose on their simplicity; and any politician who tells them that he can help them by active legislative measures, that is, measures which seek to make master or workman do things he does not want to do, we may be sure is either a charlatan or an ignoramus. There is only one source, and will be only one source, from which wages can come, unless Providence should send us manna or quails or make the earth produce her fruits without sowing or reaping, and that is from the joint product of labor and capital; and the rate of wages at any particular time or place will depend on how this is divided. If laborers are few or the laborers possess great powers of combination, the laborer will receive a large share of it; if the laborers are plenty and, in addition to this, are ignorant and improvident, as they have hitherto been in all ages, they will receive a small share of it. If they choose to work hard, the product will be large; if they choose to work little—only eight hours instead of ten, for instance—the product will be proportionately smaller and their wages proportionately less, even if they receive the same sum in money; for prices of all commodities will, of course, rise. No legislature can permanently change or affect these laws any more than it could change the hour of the ebb and flow of the tide—and this

is what makes the late eight-hour legislation such a disgraceful farce. The duty of the legislator with regard to labor and capital is very simple. It consists in abolishing and removing every statute, custom, or regulation which interferes with the entire liberty of the capitalist or laborer, which tempts or forces him into doing what, in the absence of such statute, custom, or regulation, he would not do, or prevents him from doing what his individual judgment prompts him to do.

This is doubly the duty of the American legislator—for if this country have any mission beyond that of supplying food and clothing to an indefinite number of animals, it is the development of the individual man, the securing for him, as far as his mental and moral constitution will allow, the mastery of his own destiny, and the submission to his individual judgment of all the problems of his existence to solve them as best he can. The function of the law here, at least, is to see that each man in the pursuit of wealth does not interfere with his neighbor's comfort and safety; it is not, and ought not to be, the function of the law to tell him how many hours he ought to work or how much wages he ought to get, or into what business he ought to go; and there are peculiarities in a democratic government which render its blunders, when it attempts to deal with subjects of this kind, worse and more mischievous than the blunders of any other form of government. The principle on which governments in all other countries have been based since the world began is that the government ought to take care of the individual; the theory on which this government is based is that each individual in the regulation of his own conduct is wiser than any government is likely to be. This may be a mistaken theory, but we protest against the abandonment of the experiment before the republic has been a century in existence, and before a fourth of the continent is settled.

Whatever the working-men can get by voluntary combination among themselves, so as to supply to each man the strength to bargain with his employer on fair terms, that they have a right to. If, through an instrumentality of this kind, they press for twice as large a share of profits as they are now receiving, or for a reduction in the hours of labor, or for any other modification in their relations to capitalists, we have not a word to say. We think the strong desire on their part which is now manifest in every direction for higher pay and more leisure is a most encouraging sign of real moral progress, and they have just as much right to combine for the gratification of this desire as the capitalist to invest his money in the stock of a corporation. But a working-man, as a member of a combination, preserves his individuality, and acts under the guidance of his own intelligence and his own power of self-restraint and his own fidelity to his fellows. All his highest qualities are called into play in the maintenance of the "unions" which are now everywhere making such a terrible stir amongst the dry bones of the modern commercial system. He thinks, debates, foresees, waits, hopes, contrives, refrains, sacrifices, gives; in short, he plays the part of a free agent. But once pass a law deciding for what sum and for how many hours he shall work, and set the police to see that he obeys it, and you carry him back two hundred years. He becomes once more the *protégé* of the state, and his sole duty is to obey and not to think. The danger of combinations just at the present crisis is that the great economical ignorance of the members may lead to the abuse of their power and to the pursuit of the unattainable, and consequently to the temporary derangement of industry and diminution of production, or even to the perpetration of injustice. But for this we know no remedy except experience and education. Society must suffer the consequences of its own ignorance and shortcomings, and for the remediable defects of the working-man's mind or character, whatever they may be, society at large is as fairly and fully responsible as for any other social ill. Whether we see the justice of this responsibility or not, we know it exists, and we know of nothing which plays a more useful part in civilization. The more the well-educated suffer from the ignorance of the ignorant, the sooner will ignorance disappear.

PETER'S PENCE.

When the magnificent Pope Leo X. wanted money to build the Church of St. Peter, at Rome, he, in the innocence of his heart, resorted to a method which, though never popular, had been used with effect before. When we mention Monk Tetzel and his drum, the method is indicated with sufficient distinctness. The multitude of the people fell into line obediently, and swelled handsomely the building fund for the sake of getting their sins proportionably remitted. But, unfortunately for Leo, one Martin Luther had his soul stirred within him, and raised a counter clamor so indignant and so strong that the influx of money considerably slackened, and a very different sort of influx set in towards the Holy See. Owing to that method of "raising the wind," the Church of St. Peter became about the most expensive edifice that ever was put up. Besides the gold and silver it cost, the owners had to pay for it sundry rich principalities, a goodly kingdom or two, the crowns of several potentates, imperial, ducal, princely, and other, the temporal allegiance of some manly nations, and the spiritual allegiance of a good many hundred thousand of loyal subjects who thenceforth, instead of seeking salvation in the Church, thought their chance of salvation improved the further away from the Church they got.

That experiment is hardly worth repeating. But it takes a great deal of experience to beget a very little wisdom, and we are not so much surprised as aggrieved that American politicians are willing to try it again. That they *are* willing is, unhappily, too evident to be doubted. For several years it has been the custom of the party in power in New York to bestow pecuniary and other favors on the Roman Catholics. The sums thus given out of the public treasury, which the people's earnings fill, were for a long time too insignificant to provoke comment. But within a year or so they have been immense. It is true that appropriations have been made to other sectarian organizations. The Episcopalians have had something; the Jews have had a trifle; miscellaneous evangelical bodies have picked up a few crumbs. But all this together is so small that it only throws out into bolder relief the patronage bestowed on the Catholics. Twenty years ago the Common Council of New York city leased to the Roman Catholic Orphan Asylum two entire blocks of ground on Fifth Avenue, between Fifty-first and Fifty-second Streets, for ninety-nine years, at the rate of *one dollar per annum*. On one of these lots stands the asylum; on the other is rising the cathedral which may be as disastrous to the Church as St. Peter's itself was. Twenty years ago that land was comparatively cheap; it is now worth not less than a million of dollars. Last year the Catholic Church received for "charitable" objects $45,674 14. This year it has already received $80,000, and will undoubtedly receive from the Common Council $100,000 more. An immense building to accommodate a Roman Catholic fair has for several weeks obstructed travel on our most beautiful and most frequented public square.

This money is all given ostensibly and explicitly for charitable purposes. But that considerations of benevolence do not suggest the appropriations is perfectly clear from the fact that Protestant institutions of charity, though numerous and needy, get nothing, and must either live as they can or die. Nobody is simple enough to believe that religious considerations have the least weight; for why should Protestants be so generous to a faith they profess to fear? It is no calumny to say that these grants of money and land are simply bribes to secure the Irish vote in the city of New York. Now, the Irish vote is a very important matter. Again and again it has decided momentous elections. It is drilled, organized, massed, and can be thrown with resistless weight upon a given point. Time after time it has been used to defeat Republican candidates and causes; to baffle attempts at municipal reform; to sustain municipal corruptions, and to carry the measures of a sham Democracy against the intelligence and moral sense of the community. The Republicans naturally would like to get these heavy battalions on their side. They are mercenaries who are ready to transfer allegiance for spoils, and would be quite as willing to charge for Christian as for Turk, if the Christian would pay more.

The Irish vote is worth a great deal for party purposes. Two or three hundred thousand dollars a year well invested in Catholic securities is a moderate price to pay for it. A million of dollars would not be dear if that were all. The people did not grudge the money for the splendid temple which was to make their city the wonder of the world once more, and draw pilgrims from all parts of the earth to Rome. It was something beside the gold and silver that made them pause. The Irish vote may be worth much brick and mortar and the choicest corner

lots, but is it worth the indignation of the people, which is certain to be roused sooner or later by the gross misuse of their property and by the burden of illegal taxation? Is it worth the direct violation of our principle, that all forms of religion shall stand on a footing of perfect equality, shall be supported by voluntary contributions alone, and shall be entirely independent of the patronage of the state? Is it worth the open scandal brought upon republican institutions by the scarcely disguised introduction of bribery into politics? Is it worth the permanent demoralization of an immense class of citizens who are made to feel that not their intelligence but their stupidity is the thing desired, their custom not their consciences, their vice, in a word, and not their virtue? Is it worth the encouragement given to the lowest order of the population to think themselves of supreme value as an element of power in the city? Is it worth the consequence of flinging a gratuitous insult in the face of all the Protestant sects? Is it worth the risk of provoking an anti-Catholic excitement among the "evangelical" bodies that would bring reproach on the whole cause of religion, rouse the sectarian spirit to frenzy, and lead to scenes of violence that would disgrace our civilization? Religion is a dangerous weapon to use for political purposes, and if history furnishes any grounds for prophecy, it is safe to predict that the party using it in this country will pay, at last, a terrible price for its folly.

We regard this question as a political one solely. We have no prejudices against the Romish Church, and bear it no ill will. As a form of government and of faith, we appreciate its value in communities where the Celtic race is found in large numbers. We would give it fair play, and should be exceedingly sorry to see the old bitterness against it reviving in the public mind. But at the same time we are jealous for our institutions, and rather than have their character compromised by illegal or dishonest practices we must take the risk of fomenting discords we would thankfully help to lay at rest for ever. Frankly, we advise the Roman Catholics to ask no further favors, and we advise the demagogues to grant none. If the Irish vote is so precious, even to the Republican party, let us try to secure it by measures that will elevate the Irish and not debauch them. If it cannot be thus obtained, let us try to get along without it by increased efforts of our own intelligence.

LONDON.

Hugh Miller relates how, after wandering about London for the first time and asking many questions of many people, he came to the conclusion that "Londoners do not know London;" and he playfully suggests that the great city, like certain great folks, has at last grown too great "for the familiarities of intimate acquaintance." But rather, it seems to us, is London like some many-sided and opulent soul that welcomes love, confidence, and even familiarity, but is unable in turn completely to reveal itself, just because it can find no other soul large enough to inspire or to receive a revelation from the entire range of its faculties.

Indeed, no mortal, Cockney or otherwise, knows London; and it may be safely affirmed that until we have a race of men whose *forte* is what Sydney Smith said Macaulay's was, omniscience, no mortal ever will know London. Even those agreeable persons, cabmen and policemen, who approach most nearly to Macaulay's specialty, and whose vocations compel them all their lives to a daily and nightly intimacy with the streets of the wondrous city, sometimes, after years of beating about the town, find themselves lost—to use a Hibernianism—and compelled to enquire the way among streets which they then see for the first time.

And if no man can know London, neither can any nation claim London. It disdains the audacity of special ownership that it may give itself to mankind. It is for this reason, no doubt, that the foreigner in Great Britain often experiences a relief in passing from even the larger provincial towns of the kingdom up to the metropolis. In Liverpool and Manchester he feels that he is on Englishmen's ground, in Glasgow and Edinburgh on Scotchmen's, but in London on his own. Like those pre-eminent personages in literature, art, or conduct who outgrow the citizenship of any country and become fellow-citizens of all men, this city is no longer England's, but the world's. It is cosmopolitan. Who of any nation is forbidden to salute the universal Shakespeare by the same loving acclamation which John Milton used—"*my* Shakespeare"? And what countryman under the sun, even though he be the celebrated though ill-boding New Zealander of prophecy, may not address the city on the Thames as Childe Harold did the city on the Tiber, with the loyal strain,

"——*my* country, city of the soul"?

And this claim on behalf of mankind of the freedom of London seems admitted by the last report of that mightiest nineteenth-century autocrat, the census-taker, who, among other curious facts, tells us that there are more Scotchmen in London than in Edinburgh, more Irishmen than in Dublin, more Germans than in any town of Germany excepting Berlin, more Roman Catholics than in Rome, and more Jews than in Palestine.

In the present magnitude of London it is amusing to remember the comments upon its greatness made by Addison or Burke or Dr. Johnson at a time when it was to its present self what the babe is to the man. One Good Friday, Johnson and his man Bozzy trudged together along the Strand to attend service at St. Clement Danes. Bozzy remarked that "London was too large, for the reason that nobody was heeded by his neighbor, and there was no fear of censure for not observing Good Friday." The doctor snubbed the fawning coxcomb for his Pharisaical speech, but admitted that for other reasons London was really too large. It was then about one-sixth its present size.

The growth of the town since the happy year when Londoners learned how, with proper accuracy, to count their own noses, presents us a record full of interest, and at the same time to us full of wholesome admonition to cultivate a grace rarely found in America—urban modesty.

In 1801 the population of London was	-	-	864,845
In 1811	"	"	- - - - 1,009,546
In 1821	"	"	- - - - 1,225,694
In 1831	"	"	- - - - 1,474,069
In 1841	"	"	- - - - 1,873,676
In 1851	"	"	- - - - 2,363,141
In 1861	"	"	- - - - 2,803,034

In this country our ears are perpetually stunned by the din of boasting kept up at the growth of certain of our ambitious but still callow inland towns. The growth of these towns is indeed wonderful, but it would be none the less wonderful if there were less noise made about it. Who ever saw one rational Londoner exhibiting the least vanity at the amazing and pauseless increase of that titanic town? As soon would he think of finding food for individual conceit in the magnificence of the sun in heaven, or in the mellow richness of the verdure upon the outlying fields. Yet how the statistics of the expansion of London, which are left to tell in silence their own astounding tale, dwarf the records of accumulating talk which so many American cities blazon at every corner and bellow from every house-top!

Taking the last census in each country as the standard of comparison, it appears that during the ten years preceding 1861 London added to itself a new city one-half the size of New York, more than twice the size of Baltimore, nearly three times the size of Boston, more than three times the size of Cincinnati or St. Louis, and more than four times the size of Chicago. If the eight cities of Buffalo, Rochester, Albany, Pittsburg, Newark, Providence, Portland, and Milwaukee had been taken up bodily in 1861, put on shipboard, conveyed across the Atlantic, and deposited on the fringe of the skirts of London, they, with their united populations, would not have added to London so much as London quietly added to itself during the previous decennial period. Every twelve months a new city springs into being along the globous verge of London equal to the city of Cleveland.

Jonathan is a very clever boy, no doubt, and no doubt Jonathan knows it. But he will be quite as clever when, grown tired of spouting his own praises, he sets out on his travels, compares notes with other people, and learns a little modesty by learning that he has not a monopoly of the business of *doing "big things."*

The author of the "Epriella Letters" divides the people of London into two races, the solar and the lunar. By some recent estimates it appears that these races are now even more distinctly separated by the exactions of commerce than they were in Southey's time by those of fashion. Several years ago the metropolis, like some fabulous Cyclops, sprawled out upon its couch of 78,000 acres; but the original *city*, the venerable parent of this gigantean monster, is still content with that pigmy bed of 723 acres on which it has reposed for a thousand years. The *city*, though so small, is still the centre of the trading, financial, and journalistic life of London, and has, it seems, a day population of 283,520 souls, and a night population of only 113,387 souls. Thus, every morning there come rushing into the city from suburb and rural cottage and country villa, to toil and get rich within the narrow walls of the old city, 170,133 persons, while there are 509,611 customers and clients who enter the city every day to deal with them. What tremendous energy, then, must be in the systole and diastole of this

Cyclopean heart, whose throb can suck in and expel every day along its veins and arteries a living stream of 728,986 human beings!

No Londoner, as we have already said, thinks of boasting of the awfully increasing proportions of London; but many a Londoner contemplates the subject with anxiety. One troublesome problem is that of ingress and egress. Every morning nearly a million of men make a rush to get into a space of seven hundred acres, and every night they make a rush to get out of it. No wonder that in addition to streets on the level of the houses they are compelled to build streets under the houses and streets over the houses, and that in a few years there must inevitably be three continuous cities of London—terrene London, subterrene London, and superterrene London. But the swollen and congested state of the veins and arteries of the mighty town is not the only source of anxiety. What shall London do for lungs? A meeting assembled at the Mansion House some time ago, under the call of the Lord Mayor, to consider the peril arising from the disappearance of commons and open spaces in the neighborhood of the metropolis. The meeting was addressed by Thomas Hughes and other gentlemen of note. The most important speech was embodied in some very startling and amusing estimates of the future development of London presented by Mr. Benjamin Scott, the excellent and versatile chamberlain of the city, whose ingenious argument in defense of the Pilgrim Fathers was recently noticed in these columns.

Mr. Scott thought that in dealing with the question before the meeting they should not confine their calculations to 3,000,000 inhabitants. He found that in 1861 there were 3,222,717 persons living within an area of sixteen miles, taking Charing Cross as the centre. An increase of population had been going on within that area during the past half-century at the rate of $19\frac{6}{10}$ per cent. every ten years. In fifty years, at this rate, the population of the same area would be 8,532,000 souls. What would be their position fifty years hence if they were allowed only the radius at present supposed to be sufficient? He found that in 1801 the people were twenty yards from each other, in 1851 about fourteen yards, and in 1866 something over nine yards. If this diminution of space went on for fifty years more, they would be more closely packed than his audience were at that moment—in fact there would be no standing-room for them!

We may get some impression of the present magnitude of London by looking at a few details of its colossal state. More than 350,000 houses are required for this giant to live in; and that he may take his walks and drives with comfort, he has laid out and paved a number of streets which, if placed in line, would extend from Liverpool to New York. As he is not one of those good giants who are early to bed and early to rise, he has been obliged to erect for his nocturnal guidance 360,000 gas-lamps along his streets, and to keep them burning all night, thus consuming every twenty-four hours about 13,000,000 cubic feet of gas. To bathe his person, to wash his clothes, and to supply the various vulgar needs of his kitchen, as well as to furnish him occasionally with a beverage which he is rather too much inclined to despise, he uses 44,383,328 gallons of water per day. He seems to depend a good deal on artificial heat for a variety of purposes, and is accordingly compelled to shovel into his bin 5,000,000 tons of coal every year. Though he does not always dress with great splendor, his clothing bill is a generous one, for he constantly maintains 2,950 merchant tailors, 3,000 boot and shoe dealers, 1,560 milliners and dressmakers, and 1,080 linen-drapers. Notwithstanding the fact that he is endowed with excellent locomotive faculties, he frequently prefers to be carried, and for this purpose he keeps always within call 5,000 cabs, 1,500 omnibuses, and 24,000 horses, besides all the other sorts of vehicles which human need can require or human wit invent. Like giants in general, he is blessed with a very tolerable appetite; and as to thirst, it may be safely said that he is never wholly without its cravings. In the course of every year he manages to devour 1,600,000 quarters of wheat, 240,000 bullocks, 1,700,000 sheep, 28,000 calves, 35,000 pigs, 10,000,000 head of game, 3,000,000 salmon, and innumerable fish of other sorts; while, during the same period, to use the language of a deceased humorist, he "puts himself outside" of 43,200,000 gallons of beer, 2,000,000 gallons of spirits, and 65,000 pipes of wine. His dairy may be regarded as a respectable one, for he keeps 13,000 cows. It must be confessed that he occasionally indulges in the weed, for he supports 1,350 tobacconists. Of course any giant, whether Christian or pagan, who will go on eating, drinking, smoking, and dressing at this rate, to say nothing of keeping his lamps burning all night, deserves to be ill; and we hear without surprise that he has provided himself with the constant attendance of 2,400 doctors. To all his other qualities it is to be added that, though something of a rake and a good deal of a sot, he is in certain moods a marvellously religious giant, all which he proves by the fact that he keeps up 852 churches and employs the ghostly counsel of 930 divines.

Such are a few aspects of London—that province of bricks, that modern Babel of all lands and tongues, so well depicted by Walter Thornbury as "the vast, the negative, the miserable, the loathsome, the great, the magnificent."

ITALIAN LIVING.

JUNE 29, 1867.

"Do in Rome as the Romans do" may or not be a safe proverb, but to live in America as sensible Americans live in Rome would lengthen and sweeten the lives of our women, it seems to me, incomparably beyond the privileges of the ballot-box. Sister Jonathan's house in Boston is of three stories, with basement and attic, and a corresponding number of entries and staircases to be tidied and traversed daily, hourly. Three abundant and varied meals are to be prepared in the house, and punctually served each day. Two-sevenths, at least, of every week are at the mercy of the laundry, that "monster of such hideous mien," destroying the peace of thousands of households. Milan and the Millennium blend confusedly in my mind ever since a resident of that city assured me that, to the best of her knowledge, every article of household and body linen was carried beyond the gates for washing. To assist our American sister in all this, and the numberless other details of housekeeping, she has from one to three servants, who, ninety-eight chances in a hundred, are such only in a Miltonic sense—*i. e.*, "they also serve who only stand and wait," while she does the work, and are sure to take to their beds or heels in any special emergency. What wonder if, after years of temper-trying and body-wearing vibration between the cook below and the nurse above, Brother Jonathan (not being a ghoul of the "New Atmosphere") should discover that his wife needs change of air and scene. But my ideal *dramatis personæ* are cumbersome; let me add my mite of testimony in the perpetual suit of parlor *vs.* kitchen by simply telling how we lived in Rome. Equal or greater advantages are afforded by almost any other Continental city, and it may be helpful to some pilgrim whose face is turned Expositionward, and whose purse is limited, to hear the experience of one more predecessor of like condition, although the same story may have been better told before.

Our party, consisting of a gentleman, two ladies, a child and nurse, hired an *appartemento* for sixty dollars per month. Many of our acquaintances paid less for ampler accommodations; but we were satisfied, living, as we did, directly upon the Corso, midway between the Piazza del Popolo and the church of San Carlo, in a new building (a wonder in Rome), with a sun-exposure (a greater wonder), and fresh, clean walls and furniture, not dissoluble at a touch (wonder of wonders). The entrance and staircase were broad and clean, well lighted by gas moreover, which it is only fair to state was a distinguishing favor which kindled the envy of the majority of our visitors, who groped their way through darkness to their own lodgings.

Our *appartemento* comprised a parlor, three bed-rooms, dining-room, kitchen, closets, and two ante-rooms, which might have been used had occasion required as sitting or even bed-rooms, all upon one floor. It should also be said that full table and bed furniture were included in the rent, together with the weekly washing of house linen. Also, although we had three windows looking out upon the Corso, we were not, in spite of Mr. Murray's warning, disturbed in our exclusive occupany during the carnival season. Four dollars per month gave us the good-natured service of a Roman woman who "kept herself;" that is, ate and slept at home. That Luisa spoke and understood no language but her own *patois* was certainly a venial offence, and even gave piquancy to the communication between mistress and maid. It was almost refreshing to housewives wearisomely used to birds who could but would not sing to have to deal with Luisa's innocent dumbness and obtuseness. Upon the ever-smiling object of them the effect of our instructions was often imperceptible, but upon baby Bell's Irish nurse fairly maddening: "Luisa! ye spalpeen! ye fooley! donty hear the missus tellin' ye hangey kettle, drawing-room firey!" No, Luisa had n't heard; and Bridget's objurgation only broadened her stolid countenance with a deprecatory blush and smile, which made her assailant fairly foam with rage. It must also be confessed that the housekeepers were occasionally guilty of issuing an order to the smiling Luisa in loud German, French, or English, under the temporary impression that she was an accomplished but deaf linguist.

As for our *cuisine*, we were like unto Elijah at Kidron. Our dinners, at least, were brought by the ravens. From 5 P.M. onward the Corso is enlivened by porters from the various *trattorie* of the city, balancing on their heads oblong tin boxes, which contain the viands previously ordered for dinner, kept at savory heat by a brazier of burning coals. The dessert, if to be eaten cold, is carried in one hand (its dishes tied in a napkin, we will hope), while the other steadies the burden on the head. This custom is so

universal among foreign residents in Rome that it is not at all uncommon when invited to dine out to be able to make your way to your host's by simply following your nose, ascending the staircase behind a procession of boxes redolent of the courses which will presently be elegantly served. Acting on a hint from our good fairy, the wife of the physician to our legation, we ordered "a *scudo* (one dollar) dinner for two persons." This proved ample for our three selves, baby Bell and her nurse, with a nice bit left over for lunch next day, beside the remnants which Luisa bore home triumphantly—readily understanding a whispered permission in the English tongue so to do—each night.

For the benefit of tourists of moderate means, I will give our bill of fare: 1st, Soup; 2d, A roast or cutlets; 3d, Chickens, pigeons, larks, or some other flying thing; 4th, A *dolce* of some sort—pudding, pie, or tart. Half a dozen *baiocchi* gave us incomparable salad and excellent oranges. The native red wine, without which one is forbidden to drink the water of Rome, we bought for fifteen cents a bottle, and sweet white wine, in its dainty flask, for a franc. Our bread (Graham and wheat) came every morning fresh and sweet from Mrs. Miller's English bakery; then there was butter—which, as I remember the tempting little pats, each lying cool and fair in its fresh leaf, brought every morning from the Swiss dairy in the *Babnino*, fills my soul with loathing for even the choicest product of our June dairies—and, finally, we had a flask of milk and three little jugs of luscious cream, price six baiocchi. The earliest waker in our establishment always found the patient Luisa waiting on the landing, with her unfailing smile, and her apron full of the day's supply of fresh eggs, oranges, and salad. Our morning meal was a simple affair of coffee, eggs, and cream. Our *déjeûner*, at high noon, consisted of cold meat, cakes from a Swiss bakery on the Corso, and fruit. Bread and butter, of course, made the staple of both these meals. When one caterer became "near" or neglectful, we ordered dinners for a week from a rival *trattoria* or brought the American eagle to bear upon him in the person of our bright-eyed little godmother, before whom he quailed. Occasionally, however, after an attack of nostalgia, we would intermit the *trattoria* dinner, and sally out to market, the faithful Luisa following. Here we bought a juicy steak, there crisped maccaroni, and down under the shadow of the Pantheon mealy potatoes, and consigned them to Luisa's apron or market-pocket; and when all this was done we were still able to indulge in the extravagance of a dessert from Spillman's, so much less than the twenty-five cents per adult per mouth to which we limited ourselves had this impromptu meal cost.

But when seated at table after the preparation of this repast (during which Luisa, emulative of Yankee kitchen graces, had stood stock-still mooning at us admiringly while we did for ourselves what our Italian was insufficient to teach her to do), our faces scarlet with the heat and exertion requisite to keep the steak turning in the air, our fingers smarting with the effect of rescuing the potatoes from the ashes of the drawing-room fire, and burning the maccaroni with a hot shovel, we looked at each other commiseratingly and said, This is a very good dinner, but it is our Luisas (minus the unfailing smile and willingness) and our ten hundred and ninety-five such meals every year which kill our mothers and sisters. Let us return to the "moutons" of the *trattoria*. You see the advantage which would at once be given to the house-mother were this institution to be transplanted to our land. Does Brother Jonathan in the innocence of his heart bring home with him to dinner on "washing-day," without warning, his classmate Smith, who, as you are aware, is already prejudiced in your favor by the fact that he fully intended J. should marry his own sister—you are able to vanquish him with a smile of welcome and a well-ordered dinner from the *trattoria* around the corner, which for aught he dare say is your ordinary expression and fare.

Does Bridget's impertinence culminate in an offence which forces you to dismiss her instantly without regard to the progress of the dinner to which you have invited guests, how inexpressibly soothing it would be to be delivered from the humiliation of knowing—and *knowing that Bridget knows*—that after she has turned her scornful back, and the first flush of triumphant relief has faded from your cheek, there will come an inevitable round of wearisome drudgery which will seat you with your guests a broken-spirited, distracted hostess, around a doubtful dinner! Now, if every cook understood perfectly well that whenever and wherever she might leave her mistress, that happy woman need only take the nearest *trattoria* in her morning walk, and await in peaceful leisure a succession of good dinners and new cooks, would it not, with all reverence for the wise man, be found far more effectual than a soft answer in turning away the wrath of our household tyrants?

It is too late to avert the wrinkles of this generation, but let us smooth our daughters' brows and paths by setting up a *trattoria* over against the church and school-house in every community. What good man will begin? They say Vineland is a model community: why will not Vineland hold a town meeting and discuss this matter?

ENGLAND.

London, June 14, 1867.

Parliament has taken as usual a short recess at Whitsuntide, and a small space has consequently been devoted by the papers to the proceedings of that mysterious body, Convocation. What may be the secret rights and privileges of Convocation, is a question for profound legal antiquarians. Practically their power has been reduced for the last two centuries to mere talk, and they are feebly trying to talk a little louder than usual in consequence, probably, of the important movements which every one feels to be taking place in the Church. They desire, as it were, to put themselves "in evidence," and to show that there really is a body which claims to exercise authority in ecclesiastical matters. Indeed, they have on this occasion protested against any interference of the state in church questions or ritual, without the consent of the Church. There is very little prospect that their protest will receive any attention—and for very good reasons. In the first place, by "the consent of the Church" they mean the consent of Convocation, and Convocation is elected by the clergy alone. Now, it is perfectly certain that the laity are less disposed than ever to permit the clergy to settle matters according to their own tastes. The ritualists, who are now the most active, though in my opinion the most feeble-minded and intellectually retrograde, party in the Church, have done much to alienate two important classes—the genuine old thoroughbred British Protestants, and the party which inclines to freedom of thought in every direction. Their extravagant pretensions have so far disgusted the laity that it is perfectly certain that they will not soon be released from any of the legislative fetters which at present restrain their action. The common view would be that they make fools enough of themselves as it is, and that a very little more rope would enable them to hang themselves and fatally injure the institution of which they claim to be the salt. This difficulty, however, merely concerns those who profess to belong to the Church of England. There is a larger party which will claim to have its voice heard. According to the old theory, every English subject is *ipso facto* a member of the Church of England; he may not choose—very often he does not choose—to avail himself of the services of its ministers, but he has a right, for example, to the use of his parish church and to be married or receive the other rites of the church from the parish clergyman. Although a very large fraction of the population, according to some statements as much as half, has ceased to belong in any other sense to the Church, they still feel that they have an interest in its property. The endowments by which the Church is supported are simply the national fund which this nation devotes to purposes of religious education. The Church of England is merely the religious department of the Government. The regulations at present enforced are unfortunately such as to deprive many men of any benefits arising from the property; and so far they are faulty. We submit to them at present, as we submit to many other anomalies, because the *vis inertiæ* of conservatism is too great to be overcome. But in any new arrangements that may be introduced the interests of the excluded part of the population will have to be considered. When the Reform bill is fairly off our minds, it is not improbable that church questions will be coming up in spite of any resistance of Convocation. The changes, if any, will be in the direction of giving the laity and dissenters more influence than they have at present.

The question, indeed, is a very large one, far too large to be at all discussed here; and I have contented myself with giving the view of the liberal party, without stating the opposition theory of the High Church, which depends upon theological dogmas that are rather galvanized into activity than alive. Meanwhile, every one feels that difficulties are arising, that parties are daily diverging further and further, and the extremes gathering strength at the expense of moderate men. Such omens should warn persons interested in the stability of our institutions to look about them and gird up their loins for action. The bishops have clearly felt this after a dim way of their own, and have got up a debate to show that they can take a worthy view of their position. It seems that the Bishop of Oxford lately presented to the library of Convocation a copy of "Debrett's Peerage," a useful work of reference, as most people would imagine. A zealous bishop, however, discovered that Debrett includes amongst his dignitaries the Scotch prelates, who are not recognized by the state. Accordingly, after a solemn debate, the Bishop of Oxford was censured for introducing so heretical a work. And yet, after this proof of activity, there are persons who will persist in poking fun at the poor old bishops and even go so far as to call

them old women. To say the truth, as Convocation is not allowed to do anything serious, it amuses itself by these trifles, and is a specimen of what Mr. Carlyle would call an enchanted wiggery—interesting to the mind of Dryasdust, but to ordinary mortals healthily impatient of shams an annoyance and a vexation of spirit.

The battle, of which symptoms are not rare nor equivocal, over the existing privileges of the Church will perhaps begin upon educational questions. It is the great merit of the Church of England that its clergy are really the main supporters of education in the country districts. If they are somewhat narrow in their views and think that a child ought to learn nothing unless he will learn the Church catechism, that is only a common fault of all denominational school systems. It would be most unjust not to acknowledge their merits; but it is also true that their scruples form a hindrance to the introduction of a more effective system, and that in presenting them some awkward questions will be raised. It is, however, at the other end of the scale that skirmishing has already been carried on with some liveliness. The Church struggles hard to keep its hold upon the universities. Gradually and step by step they are being opened to the country at large; but there are in them so many strongholds, so many vested interests, and so many complex arrangements which the outside world cannot understand, that progress is somewhat slow. I do not know whether I can make the present state of the question quite intelligible to those who are not minutely informed as to the curious constitution of an English university. The main facts, however, are about as follows: Dissenters of any denomination may at present become students at either university (the old system under which they had to sign the Thirty-nine Articles upon entering Oxford having been abolished). At Cambridge they may also take degrees, but they do not obtain a vote in the Senate (which is the supreme body in the university) nor in the election of university members of Parliament. At Oxford they may only take the first degree (the B.A.), and therefore can obtain none of the privileges (not very extensive ones) nor of the prestige attached to such combinations of letters as M.A. or LL.D. So far it would seem that they have little disadvantage, and, in fact, I have known Jews, Roman Catholics, and Protestants of all denominations, and even Mohammedans, as students at the universities. They have to pass an examination or two in the Greek Testament, but there is no test of faith. Still, dissenters are comparatively rare, and for a very good reason. The great ambition of every Oxford or Cambridge student is to obtain a fellowship—partly for the emolument and more for the honor. The fellows form the governing bodies of the colleges, and the colleges are, for most purposes, the universities—that is, they manage the discipline and the education, and every member of the university is or has been a member of some college. Now, these rich foundations are entirely under the management of churchmen and their pecuniary benefits are shared almost exclusively by churchmen. So long as they are not thrown open, the bare leave to study is of comparatively little value to dissenters—the majority of whom moreover belong to a social class below that from which most university students are drawn.

A bill has passed its second reading in the House of Commons which will enable any college to do away with this restriction as far as it is affected. It will probably be thrown out in the House of Lords; but it must be passed before long, for the feeling in favor of it is steadily increasing. The only practical argument urged against it is the necessity of giving to young men some uniform and authoritative system of religious instruction. The value of this argument may be estimated by any one who knows that Oxford has been for many years, and still is, the centre from which all religious movements amongst the English upper classes radiate. Every possible question, from the propriety of vestments up to the being of a God, is there discussed with an interest unequalled elsewhere, and to attempt to bar discussion out of Oxford by any system of tests is like forbidding any one to throw water into the Isis for fear of a flood. From clergymen who call themselves Catholic priests, and are indistinguishable to the vulgar eye from the genuine Romanist article, to the bigoted worshippers after the school of Comte, no shade of opinion is unrepresented, and every side of every argument is eagerly canvassed. The objection is, in fact, merely one of those that are put out as a diversion, and will doubtless disappear before long when it is no longer wanted.

The mention of the House of Lords in connection with this agitation reminds me of one rather curious symptom of the times. Mr. Frank Newman has just published an article in *Fraser* pointing out what he considers to be the defects in that venerable institution, and recommending sundry reforms, suggested partly by what he considers to be the virtues of the United States Senate. The topic thus opened has been discussed by several newspapers, and even *The Times* has said some very strong things about the necessity for reform. No one expects that any great change is likely to be soon made in this respectable body, which is at present content to act simply as a drag upon active legislation. There are, however, two changes which seem to meet with general approval, and which are desired by those who hope to see the House of Lords made of some use, instead of permitting it to sink into decrepitude. The first is the abolition of voting by proxy—a system which enables idle gentlemen, who are betting at Newmarket or yachting in the Mediterranean, to strengthen the hands of their party leader and control, to some extent, the fate of the country. The second is the creation of life peers—a measure which was rejected by the instincts of the House of Lords when proposed by Lord Palmerston. They naturally felt that it would weaken them, in one sense, by encouraging a minister to give the peerage to as many of his supporters as he chose, without the responsibility of permanently cheapening the order. Still it is necessary that such a measure should be passed if the peers are really to be an effective body; for at present they are scandalously weak in debate, and it is yet difficult to reinforce them without cheapening the privilege beyond what it will bear. These matters, however, are scarcely ripe even for discussion.

Correspondence.

ADULTERY IN BRAZILIAN LAW.

To the Editor of The Nation:

The essay, "Women and Juries," in The Nation for June 13, 1867, brought to mind the "Codigo criminal do Imperio do Brazil," which seems to provide wisely for such cases as those to which the essay in question refers.

The proverb says, "It requires two to make a bargain." Adultery implies assent. Without assent the act must be "rape," or at least "assault and battery." If the woman yields to persuasion or to spontaneous inclination, surely she is as deserving of punishment as the man. If the husband is bound in honor to assassinate the man who has offended him, he is in equity bound to murder his wife also. But if there are any circumstances which make it dishonorable in a man not to murder either his own or his wife's friend, society, for its own safety, is bound to exact from him the just penalty of his crime, if what he has done for honor's sake can be considered a crime.

The following brief translation is recommended for consideration:

The criminal code of the Empire of Brazil, printed in 1837, provides, *Art.* 249, that any one who contracts a second marriage until after the first is dissolved, shall serve at hard labor from two to six years, and be fined.

Art. 250. A married woman who commits adultery shall be imprisoned at hard labor from one to three years. The adulterer shall suffer the same punishment.

Art. 251. A married man who keeps a concubine shall suffer the penalties of the preceding article.

Art. 252. Accusation of this crime (adultery) shall not be made by any one who is not husband or wife; these shall not have the right to make the charge if at any time they have consented to adultery.

Art. 253. The charge of adultery must be made jointly against the woman and the man with whom the crime has been committed, if alive, and one shall not be condemned without the other. W. S. W. R.

The Week.

IF any one doubted that within the last five or six years the country has grown a good many times six years older, he might have been profited by observing the quiet and sensible way in which the national anniversary was celebrated. The national bird was never, we suppose, in better health, and his spirits were always good, but we think he gets less and less apt to sport himself in the empyrean. We did not even see him balance himself once over the frozen regions of the Arctic pole, though Mr. Seward undoubtedly has given him his passport. The South, of course, can hardly be expected to rejoice on any occasion when the North makes holiday, and this year, as last year, the labor of celebrating the day fell on the negroes and the military. But in Charleston Governor Orr gave General Sickles a state dinner, and there were national salutes and some military parades and some speech-making—to negroes mainly—at Montgomery, Richmond, Mobile, and New Orleans. In Richmond, however, General Schofield had to send a special order to compel the county courts to observe the day by adjourning.

The adjourned session of the Fortieth Congress met on Wednesday week. In the Senate the proceedings began with a protest from Mr. Sumner, who thought Congress had done wrong in providing that if a quorum should not be present on the 3d of July, the Houses should adjourn *sine die*. He was pronounced out of order, and then it was ascertained whether or not a quorum was in attendance. Thirty senators answered to their names, and nineteen were absent. Mr. Trumbull showed the needlessness of Mr. Sumner's protest, but it had at any rate made manifest Mr. Sumner's desire that the Senate should not confine itself strictly to Reconstruction business during this session. On Friday he found nine senators to agree with him, Mr. Anthony's limiting resolution being under discussion, but the vote against him was twenty-three. The debate was marked by a good deal of asperity—Mr. Fessenden, in particular, apparently having too little patience with Mr. Sumner's mode of speaking and a sort of petulant contempt for his ideas. Supplementary reconstruction bills were freely offered—Mr. Wilson, Mr. Drake, Mr. Edmunds, and Mr. Frelinghuysen each bringing in one. Mr. Sumner offered his bill enforcing, by act of Congress, impartial suffrage throughout the length and breadth of the Union. Mr. Sumner also offered a confiscating resolution, declaring it the President's duty, in the exercise of the pardoning power, to make every landholder that he pardons share out a certain part of his estate among his former slaves. On Monday the various supplementary bills came back from the Judiciary Committee in the form of one bill. Information on Mexican affairs was called for by a resolution of Mr. Sumner's; and Mr. Sumner prevented a speech from Mr. Chandler in praise of the execution of Maximilian. On Tuesday Mr. Trumbull opened the debate on the new bill, but the only noteworthy result was the vote rejecting Mr. Wilson's amendment, vacating all civil offices at the South.

The House, by a decided vote, agreed to limit legislation at this adjourned session to Reconstruction measures. Its first business of importance was in reference to the Kentucky members. Some sweeping amendments of Mr. Logan's invention were substituted for an unobjectionable resolution of Mr. Schenck's. Mr. Schenck brought specific charges of disloyalty against Mr. J. D. Young. Mr. Logan demanded, and the House by a vote of 67 to 50 approved his views, that the entire delegation from Kentucky should be denied admission and the State deprived of representation in the House, till the Committee on Elections decide whether or not the people of Kentucky are loyal. On Friday Mr. Bingham denounced this action of the House, and Mr. Marshall of Illinois presented a protest from some of the rejected members, whereupon General Logan expressed his regret that "a representative of the proud old Prairie State" should do so. On Monday the Committee on Elections made a report which effectually disposed of the amendment of Mr. Logan, and the House authorized the committee to pass upon specific charges of disloyalty made against members. On Friday a new committee of nine on reconstruction, with Mr. Stevens, Mr. Boutwell, Mr. Bingham, and Mr. Brooks among its members, was appointed by the Speaker; and on Monday Mr. Stevens reported a supplementary bill, which is in some particulars different from the Senate bill, the two committees having worked separately, and their views being somewhat divergent. The House bill, for instance, gives no additional powers to General Grant. On Monday, the names of States being called for bills and joint resolutions, five or six about Mexican affairs were offered—those by the Republicans being favorable to the Juarez government, and those of one or two Western Republicans rejoicing without disguise in the execution of Maximilian. Messrs. James Brooks and Fernando Wood, of the Democrats, were bitter against the Liberals; Mr. Brooks wanting the neutrality laws repealed, that filibusters may go in and possess Mexico, and Mr. Wood wanting reparation for the insult to the American flag when Santa Anna was captured. Mr. Butler succeeded in passing resolutions authorizing him and four other members to investigate the murder of Mr. Lincoln. On Tuesday, under the previous question, the supplementary bill was passed by a vote of 119 to 31—the news of which comes too late for comment.

The proceedings in the Senate were marked by a curious debate as to the powers of party caucuses. It appears it was resolved by a majority vote in the Republican caucus that the Senate should confine itself strictly and exclusively to the work of amending, or rather explaining, the Reconstruction act. Mr. Sumner, who attended the caucus meeting, and who voted at it, refused, however, to be bound by its decision, and argued in favor of a long session, and of general legislation. On being reminded of his participation in the caucus, he justified repudiation of its authority by pleading the higher obligation of his position as Senator of the United States; and on being asked

what he would have said if the minority of the caucus had repudiated in like manner when he introduced his proposition in favor of universal suffrage, he maintained that there "was a difference between repudiating in favor of human rights and repudiating against them"—a doctrine which excited a good deal of merriment. Now the point where a senator's conscience ought to be set to work to instruct him as to the force of caucus decisions, is the moment of entering a caucus. It may not be consistent with a senator's duty to the country to allow a caucus to decide for him what course he shall follow in his seat, but any senator who thinks so is bound to keep out of caucuses altogether; when he goes into one and votes in it, he gives all other members present to understand that he will submit to the decision of the majority. If this understanding was not general, and had not the force of a mutual pledge, nobody would vote, and no caucuses would be held. Anybody who is present at such meetings secretly intending that, if he finds himself in the majority, he will exact compliance from the minority, but that if he find himself in the minority he will "repudiate," is simply guilty of a breach of faith, and a rather puerile one at that. There are many objections to legislative caucuses, but we do not see how they are to be dispensed with as long as there are no party leaders, as there are in the English House of Commons, whom the main body are expected to follow. As parties are organized here, it would never do to arrange plans of operations in the Senate or House in the presence and hearing of the enemy, and plans of operations must be arranged somehow before questions come up. But each member who wishes to act independently is bound in honor to abstain from taking part in the caucus deliberations, unless he announces at once his intention to preserve his liberty of action. Whether a man has or has not a right to "repudiate in favor of human rights," is, in another form, the old question of whether we may do evil that good may come; and we confess we know of no place in which Mr. Sumner will find very valuable support for his position outside the contributions of the Jesuit fathers to the science of casuistry.

Senator Wade's views on the distribution of property have excited much uproar, and his explanation having proved rather feeble, his friends, we are sorry to say, are resorting, as is not uncommon in such cases, to defamation of the correspondent of the New York *Times* who reported the unfortunate speech. Fortunately for the correspondent, however, the report was three days in the hands of the excursion party before any exception was taken to it, and its correctness was and is still acknowledged by the most accurate of Mr. Wade's audience. We may add our personal testimony that the correspondent in question is not an ordinary concocter of sensational news but a man who knows what words mean, and who both listens and writes with a more than usual zeal and conscientiousness. The matter, however, is mainly important after all as showing the necessity of bringing public opinion into play with greater force than ever before for the restraining and chastening of thoughtless and bumptious orators, especially when they are in as high a political position as Mr. Wade is. There was a time in American history when idle words, no matter from whom they fell, were sure to be harmless, but that time has passed away. A large mass of our population at present does not possess the critical power of the primeval Yankee.

The conduct of the elder Bradley, one of Surratt's lawyers, who assaulted Judge Fisher because some of the judge's really too mild rebukes seemed to him not sufficiently respectful to himself as counsel, has passed with little animadversion from the press, and none at all from the bench which he insulted so grossly or the bar whose character he has shamefully lowered wherever the report of the trial goes. Judge Fisher appears to be as unable to protect his own dignity as to protect the witnesses whom he sees abused in what he himself calls an unexampled manner. The case for the prosecution is closed, and the defence has begun. Surratt's counsel expect to prove an alibi in his favor, and profess to be able to clear up all the things which look now most damaging to the prisoner. His leaving his mother to be hanged will be shown to have been due not to any want of honor or natural affection, but to the fact that he was kept perfectly secluded by the Canadian priests with whom he took refuge, and got no news at all of the world outside. Weichman's testimony is to be wholly discredited, and the innocence of Mrs. Surratt made plain; Sergeant Dye is to be shown mistaken in regard to its being Surratt who called the time in the vestibule of the theatre, and a reasonable explanation of why the time was called is to be given. Of more interest than the other promises of the counsel for the defence—for the public care more about getting a full history of the assassination plot than about the life or death of Surratt—is the promise to produce in evidence the language of a confessing and justificatory letter, written by Booth for publication in *The National Intelligencer*, and signed by Atzerodt, Payne, Harold, and Booth himself. If there ever was such a letter—and it would have been quite Booth's way to have written it—it is by no means unlikely that the brutal and fanatical Payne, the half-witted boy Harold, the stupid Atzerodt, could have been got to sign it. But Surratt appears to be rather an over-cautious than a foolhardy man, though he did freely deal in insinuations and inuendoes in his talk with McMillan when he thought himself safe. The friends of Mudd and Spangler—the latter not improbably a much-injured man—will be particularly interested in this letter, and not much inclined to pardon Matthews for so long concealing his knowledge of it. Matthews, to make the story more probable, is said to be a gross coward.

The captain-general of Cuba issued, June 6, a fresh proclamation against the slave-trade, which it is to be hoped may be as effective as it is sweeping in its denunciation of penalties. When we read, however, that *all* the authorities of any district which has been the scene of a debarkation of negroes, or has afforded them passage, shall be deprived of office instanter, besides being made amenable to the laws, we perceive the extent of official corruption that has hitherto shielded the proscribed traffic, and the small probability that it will be eradicated by the stringent measure now adopted. In any other country, the immediate implication of the judiciary in what must have been the original fault of the military or naval forces, would seem to be monstrous; in Cuba, the army, the navy, and the judges have undoubtedly fattened together on the profits of negro importations. It remains to be seen whether any of them will be tempted by the fear of punishment to inform on each other, and thus secure the immunity which is held out by the captain-general.

The New York *Times* charges us in very strong terms with injustice, and worse than injustice, toward the "Associated Press," for having made it responsible for the ridiculous Cable telegrams, giving an account of the military review at Satory, the Ascot Races, and the Pontifical High Mass, on which we have recently commented with some severity. *The Times* says that all these "were the special despatches of a single paper, which is entitled to all the credit, as it is responsible for all the discredit, which may belong to them." It is hardly necessary to say that we have no malevolent feelings towards the Associated Press. It would be as difficult for us to dislike it as to dislike the Equator or the Great Bear. Its agent in Europe, too, is to us simply an abstraction—like the Bloated Aristocrat, the Haughty Tyrant, the Malignant Copperhead, the Genial Critic, the Gentleman and Scholar, the Prominent Citizen, the Rising Young Lawyer, or any of the other types of the newspaper world. Whenever more than one of "the great dailies" publish the same despatch, it may not, technically speaking, come from the "Associated Press;" but then, as regards the public, the papers which publish it are "associated" *ad hoc*, and it is not unfair to charge the discredit of it—if discredit it brings—on the whole body. The practice, we believe, prevails amongst the morning papers of selling each other "special despatches;" but then, as long as each journal which buys these despatches publishes them as if they were its own, we cannot allow all but the vendors to repudiate the responsibility of them. The ridiculous Cable telegram about the ladies' clothes at the Ascot Races appeared in *The Times* and *Herald* of June 7. The ridiculous telegram about the review at Satory, and announcing that "the entire press of Paris were unanimous in condemning" the attempt to assassinate the Emperor of Russia, appeared in *The Times*, *Herald*, *World*, and *Tribune* of June 8. The ridiculous telegram describing the emotion of some weak-minded newsmonger on witnessing the elevation of the Host in St. Peter's the other day, appeared in *The Herald* of June 28, in *The Times* of June 30 and July 1, and in *The World* of July 1. In all these cases the news was headed simply "Cable Telegrams," or "Advices by Ocean Tele-

graph." What, therefore, becomes of *The Times*' assertion that they were "the special despatches of a single paper?" Perhaps they were originally, but every paper that bought them, and published them in leaded type, became "associated" in the responsibility for them. *The Times* has earned honorable distinction, whatever its political errors may be, by its love of common sense and accuracy, and steady opposition to the great humbugs of the day; but we are bound to say that in the matter of Cable telegrams it has, ever since the great "special telegram" of *The Tribune* last spring, announcing the despatch of an abusive and insulting letter by Bismark to Louis Napoleon, been surpassed in discretion by its usually wilder and more sensational neighbor. We think it must acknowledge now, that in our comments on Cable news, in the instances we have cited, we have not only "aimed to be both truthful and just," but have actually succeeded in being both one and the other.

We see the Pennsylvania papers persist in calling Thaddeus Stevens "a commoner" and "a great commoner." As we remarked when commenting on this practice of theirs some months ago, every relative must have a correlative, and if Mr. Stevens be a "commoner" there must be noblemen somewhere in the Union, and as they are not visible to the public the order must be a secret one, and we solemnly call on that great revealer of things hidden, General Butler, to go to work at this mystery. If there be noblemen amongst us, they ought to show themselves or be dragged to light. It is absurd for those who style Mr. Stevens "a great commoner" to tell us we are mistaken and that there are no nobles "in our midst." Suppose Mr. Stevens were known amongst his neighbors as "The Dutiful Son," would anybody believe that he had no parents or had never had them?

By the middle of October the iron horse will be mounting the rugged sides of the Rocky Mountains, so the Jacksonville *Journal* says, and startling the genii of the mountains from the slumber of ages. The editor thinks then it would be a fine thing if two, or say three hundred editors from all parts of the country should join in an excursion to the western terminus of "the grandest achievement of the age." The various railroad companies would be sure to give free passes, he thinks, and we dare say he is right; but he is lamentably wrong when he offers us this bewitching inducement in a circular: "or, if the Indians should continue belligerent, we might join General Sherman on a short expedition, and each be allowed to take and bring away a trophy of valor in the shape of the scalp of a redskin." If the editor of *this* journal makes one of the party, he will insist, in the interest of humanity and civilization, that the editor of the Jacksonville *Journal* be allowed to go no further than Omaha, or at the very farthest Fort Kearney.

We print elsewhere a letter from a lady in reply to Dr. Lieber, which, as a piece of intellectual fence, is sufficiently remarkable, we think, to make him doubt whether a rule which excludes *all* women from the franchise can be defended on any better ground than taste. We question very much if many male readers of his pamphlet could have found so many weak spots in his armor, and have inserted in them so trenchant a blade. We commend the performance, too, as a model to the prominent female champions of woman's rights; and we venture to assure them that when any respectable number of them are able to handle their weapons nearly as well as this writer, tyrant man will fairly begin to tremble in his stronghold. At present, we fear he feels and talks very much as Suetonius talked and felt when he saw Boadicea and her hosts forming for battle. What this general said, on that occasion, can be learnt on application to Mr. Banks, Mr. Bingham, or any rising Congressman.

The riots at Birmingham are shown by the fuller accounts brought by the last mails to have been, as we ventured to conjecture when the first telegrams were received, although anti-Catholic in form, in reality anti-Irish. The Catholics, who are all Irish, rose to put down a ranting and abusive Protestant lecturer, who called the Pope "the greatest rag-and-bone grubber in the world." And after they had for some time had everything their own way, and had overpowered the police, the English working-men rose, joined the police, and went into the fray with cudgels, singing "John Brown," and put down the Irish, as Irish, and not as Catholics—the artisan class in England having really at the present day very little of the "no-popery" feeling, but detesting the Irish, of whom there is a large body in all the manufacturing towns, very cordially. The result was that the Irish quarter was sacked, and many of the inmates badly beaten, though we hear of very little, if any, loss of life. The Irish colonies—for colonies they really are—in the large English towns are made miserable by much the same causes which render them such a troublesome element in the city population of this country—their own aggressiveness, readiness to resort to force, and total want of faith in all moral agencies for the redress of grievances, or the spread of opinions. The cudgel is at once their panacea and palladium.

The English trades unions cut a sorry figure in the investigations recently conducted at Sheffield before a Government commission of enquiry. The commission was issued in consequence of the strenuous applications of the trades unions to be made legal corporations, capable of enforcing payment of dues and obedience to their rules and regulations. This, of course, raised the question of the morality of the organizations and of their fitness to be recognized by the State or armed with legal authority; and some shocking outrages, such as the blowing-up with gunpowder, perpetrated a year ago or more at Sheffield upon traitors or enemies of the Saw-grinders' Union, naturally led to the selection of that place as most likely to furnish a crucial test. In order to enable the commission to get at the truth, it was armed with the extraordinary power of granting a full pardon to anybody who might make the required revelations. The result was that two men confessed that they had murdered a man named Linley with an air-gun, simply because "he employed a lot of lads in the trade," and that they had been hired by the secretary of the union to do it, and the secretary himself confessed that he was in the habit of using the funds of the association to procure the perpetration of similar atrocities. The scene in court, when these revelations were made, was one of the most extraordinary ever witnessed in a civilized country; the witnesses were almost in a state of frenzy, and the audience was wrought up by the sight of their convulsions and the terrible nature of their story to a pitch of excitement little short of their own. The evidence will probably be used energetically against the legalization of the unions, but hardly successfully. People feel that a system cannot be judged by its abuses, and that it is perhaps the absence of legal recognition which tempts the unions to the use of violent means of enforcing their rules.

The English House of Lords has been so frightened by the recent attacks on it that its sessions are now attended by a considerable number of peers. The "scare" has apparently been most effective amongst the bishops, probably because they feel that their risks are what insurance companies call "extra-hazardous." There is talk of a committee on proxies with a view to their abolition, and this, if the alarm be kept up by the newspapers, will very probably be accomplished. One reason assigned for the small attendance and the extreme rarity of debate is the practice indulged in by Lord Derby and other elderly peers of snubbing the young ones whenever they attempt by making speeches to protract the discussion beyond the dinner hour. Lord Shaftesbury proposes to remedy this evil by meeting an hour earlier in the afternoon, at four instead of at five, so as to give the younger men a chance to be heard without subjecting their elders to inconvenience. But then it is very doubtful whether any young peer would ever be able to do himself justice after six o'clock, with the uneasiness and anxiety of his seniors increasing visibly as the minutes passed by. Many peers have come forward to the defence of the House by alleging the vanity of much speaking, and urging the abstinence of the lords from discussion as in reality a proof of their efficiency. The probabilities are that with the prospect of a reformed House of Commons staring them in the face, there will be a revival amongst their lordships and a period at least of zeal and attention to business.

Notes.

LITERARY.

MESSRS. SHELDON & Co. have in preparation a collection of the poems of Mr. Theodore Tilton, editor of *The Independent*, to be styled "The Sexton's Tale, and Other Poems." This is, we believe, the first time these works have been brought together.——D. Appleton & Co. announce more than a score more of the works of Louisa Mühlbach, of whose historical novels they have already published a large number. Mrs. Mundt is the real name of this voluminous author, whose works are very well adapted for the more sober readers of circulating library literature, the moral tone of them being exceptionally good, the history as historical as is necessary, and the story reasonably interesting. Her husband, Theodore Mundt, is a writer of more ability, who, we believe, works generally in the same field from which his wife has got so many crops, and six of his stories also are announced by the Appletons. "Mirabeau" is the title of one of them, "Robespierre" of another, "Mendoza" of another. Mrs. Mundt seems to have taken for her province the history of Germany and its various states, France, and England. Three more German historical novelists are on the Appletons' list, one being A. E. Brachvogel, the author of the play of "Narcisse," in which Mr. Daniel Bandmann used to play before American audiences. "Hamlet" and "Rizzio" are the two works of his which are announced, and, though they are not considered his best books, they are held in higher esteem than the works of the Mundts. Max Ring, author of "John Milton and His Time," and Theodore Mügge, author of "Toussaint l'Ouverture" and "Charles First and Cromwell," are the other two of the three referred to above. It will be found that Messrs. Appleton & Co., in beginning their German novelists with Louisa Mühlbach, did not begin with anything like the best contemporary German writer of this sort of literature. It is not at all unlikely that Baron Tauchnitz's new series of English translations of German authors will include the best books of the best of the writers above mentioned. It ought to include, also, one would say, a specimen or two of the performances of Theodore Gerstaecker, an amusing story-teller, rather of the geographical than the historical order, whose novel, entitled "Among the Penchuenches," a Chilian story, closes these new announcements of the Appletons. The books will, of course, be a long time in appearing.——G. W. Carleton & Co. announce for republication Frank Buckland's "Fish Hatching and the Artificial Culture of Fish," and another work by Dr. Cumming.——We have already stated that the "Harvard Memorial Biographies" is to be published in a new form by Messrs. Sever & Francis, of Cambridge, for the committee of publication. The work will be sold at a price which will barely cover the cost of manufacture. The same house will issue an enlarged edition, which will also be a revised one, of Mr. William Everett's "On the Cam."——Messrs. A. Simpson & Co. announce their intention to publish the collection of slave-songs described in THE NATION of May 30, provided they meet sufficient encouragement to do so. The book will be handsomely printed, and will probably not exceed $1 75 in cost, while a considerable reduction will be made to those taking several copies. Orders may be sent to the above firm at 60 Duane Street, N. Y. city.——Messrs. G. P. Putnam & Son announce "The Works of Daniel S. Dickinson," edited by his brother, Mr. John R. Dickinson.

—There are in England several journals conducted in the interest of co-operation, as *The Co-operator*, which is under the editorial charge of Mr. Henry Pitman, a brother of the well-known phonographer; *The Friendly Societies' Journal*, edited by Mr. James Horsey; and *The Industrial Partnership Record*, edited by Mr. E. O. Greening. Of French papers devoted to the discussion of the same subject we have seen one, *La Co-opération*, and we believe there are several others; and there are a good many German publications, notably that one managed by Mr. Schulze-Delitzsch. In this country we have heard of a similar paper written and published by some co-operative workmen in St. Louis, but we have never seen it and have heard of it but vaguely. It is to be supposed, then, that a new enterprise of Messrs. Leypoldt & Holt, a firm which seems to have taken in charge the literary interests of co-operation in America, will be useful to the working-man and the community at large. These gentlemen propose to draw from the various sources at their command the material for a series of cheap co-operative tracts, and among other articles will publish a series of prize essays that have been contributed to *The Co-operator* by certain English authors.

—Of lately published English books to be seen at Messrs. Scribner, Welford & Co.'s, we mention a few: "The Common Sense of English Orthography" is a thin little volume written by Mr. E. Jones, and commended by Professor Max Müller, Professor Bosworth, the Anglo-Saxon scholar, Dr. Thirlwall, and many other gentlemen of less reputation as philologers. Of course, it is only the wretched Dean Alford, whose native haunt seems to be the horns of dilemmas, who appears under this description: "Either he has made a perfectly wilful assertion contrary to fact, or he is ignorant of one of the commonest points in relation to the subject on which he so dogmatically writes." Mr. Jones wishes to simplify English orthography; while he believes the phonetic system of spelling is not at present to be adopted, he scoffs at the purism of the etymological school. He would strike out the *u* in such words as "honour" and "saviour," and the *e* in words like "moveable;" he would change *z* to *s* in words like "realize;" he would strike out one *l* in words like "traveller;" he would write *er* in place of *re* in words of the class of "theatre" and "calibre;" *ed* in the termination of the past tense and past participles of verbs he would change to *t*, except in certain specified cases, as, for example, when the *e* is necessary to show that the preceding vowel is long, or when the verb ends in *d*, or when it ends in *ge*. The book is clearly written, and, no doubt, "marshals us the way that we are going"—the way, in fact, that we in this country have already, to a great extent, gone. Sidney's "Arcadia" has been sacrilegiously touched by Mr. Hain Friswell—the Hain Friswell of "Bartlett's Familiar Quotations," we suppose—who apparently thinks that people who will not read the work in its original form, will read it if it is shortened and otherwise amended. But, we dare say, Mr. Friswell will not get the thanks of the general reader, and, we are sure, he deserves small thanks from the class of readers who are at all likely to care anything for the "Arcadia." John Timbs's "Nooks and Corners of English Life, Past and Present," may be properly described as consisting of pictures of the domestic manners of our forefathers at some of the most attractive periods of English history. "Oxford Lent Sermons" is a volume containing a short introduction by the Bishop of Oxford, and sermons preached at Oxford in 1866 by eight or ten divines, among whose names we see those of Dr. Pusey and H. L. Mansel. The theme of the discourses of 1865 was the strife of the Church with the evils and corruptions of this world; of these sermons of 1866 the theme is the strife of the Church with the bands of spiritual beings arrayed in hostility to it. Professor Mansel preached on the words of St. John—"He that committeth sin is of the devil, for the devil sinneth from the beginning"—and explained to his hearers "the conflict and defeat in Eden." "Synonyms and Antonyms" (counterwords) is the title of a volume just added to "Bohn's Philological Library." It is the work of C. J. Smith, M.A., late Archdeacon of Jamaica, and is a book of synonyms arranged on a new principle—words of opposite as well as words of like meaning being given under each heading. "An Outline of the Early Jewish Church from a Christian Point of View" is written by the Rev. Mr. S. C. Malan, and is "intended only for general readers, and among them for those alone who believe the Bible, and who therefore require neither tradition, research, nor wisdom of words to help their faith in the Scripture of Truth." Admiral Sir Adolphus Slade's (Mushaver Pacha's) book is entitled "Turkey and the Crimean War: a Narrative of Historical Events." "The Pyrenees: a Description of Summer Life at French Watering-Places," is by Henry Blackburn, who some time since wrote a very fair book of Spanish travel. Of this book the chief value, in the estimation of most people, will be its pictures and illustrations, which are by Gustave Doré. The artist illustrates everything, so it is not surprising, but it is a little amusing, to see from his hand a picture meant to interpret that beautiful stanza of Herbert's, which, had Herbert known the New England Plantations, one would say he wrote on an Indian summer's day. The

> "Sweet day, so cool, so calm, so bright,
> The bridal of the earth and sky,"

forms the subject of a picture anything but felicitous.—The numerous namesakes of Gulielma Maria Springett and Thomas Ellwood, who belong to a generation of Friends not yet aged but probably nearly extinct, will be glad to meet here also Maria Webb's book on "The Penns and Peningtons in the Seventeenth Century in their Domestic and Religious Life, Illustrated by Original Family Letters; also Incidental Notices of their friend Thomas Ellwood, with some of his Unpublished Verses."

—One of the most important of new English books is Mr. Lewes's "History of Philosophy"—which may properly be called a new book, it contains so much more matter than the "Biographical History of Philosophy," which appeared ten years ago (1857), in one octavo volume, containing the four pocket volumes of the edition of 1845. Much that is wholly new has been added, and of the old articles many have been amended, some have been rewritten wholly, and some have been rewritten in part, so that the author says in his preface, "My readers of twenty years ago will hardly recognize the 'Biographical History of Philosophy.'" The chronological range of the work is still the same—"from Thales to Comte"—

and though there are changes in style and enlargements of various sorts, there are no changes in doctrine; the author adhered to the positive philosophy in 1845, and he adheres to it to-day, and believes fully that the faithful student of it will find it "a doctrine which will give unity to his life." There is at any rate little doubt that, setting aside these large expectations, a student will find in it the philosophy which is to be for an indefinite period in the future most influential, and there is no doubt, we suppose, that in Mr. Lewes's book the comparative merits of the positive and other systems of philosophy may be found clearly and fairly enough set forth. In this edition the "Introduction" of the first and second editions is replaced by a "Prolegomena," in which are discussed, "What is Philosophy?" "The Objective and Subjective Methods," "The Test of Truth," "Some Infirmities of Thought," "Necessary Truths." The chapters on Plato and Aristotle have been rewritten; the chapters entitled "Scholasticism," "Arabian Philosophy," and "Roger Bacon," are entirely new; the chapters on Francis Bacon, Descartes, Leibnitz, Condillac, and Hartley have been rewritten; the chapter on Spinoza has been rewritten, and there have been added to it some new biographical details, which we suppose are contained in the very interesting article on Spinoza, from Mr. Lewes's pen, which was published some time ago in *The Fortnightly Review;* Kant Mr. Lewes has restudied, in order to the preparation of this book, and he says of Hegel that the estimate of that philosopher formerly expressed by him is unchanged, and that he had hoped to make some reply to the challenge given by Mr. Stirling in his recent work, but was prevented by the failure of his health. We are sorry to say that we see no indication of the republication of the book in this country. The old edition was published by the Appletons, who are said to decline giving the author further compensation for this new edition. But this is rather a new book than a new edition of an old one, and it is much to be wished that, if Messrs. Appleton & Co. do not, some other publishers will put the work before the American public.

—Emile de Girardin advertises *La Liberté* "as an American newspaper naturalized." Any one asked to guess the resemblance which is here suggested would probably seek for it in that freedom of speech which has brought its editor twice before the courts, and twice cost him a considerable fine and the ill-favor of the Government. M. Girardin has even gone so far as that on a recent occasion, when entertaining at his house the representatives of the foreign press in Paris, he toasted Queen Victoria, "who governs a free country," but urged the postponement of a reciprocal toast to the Emperor "till after the complete restoration of liberties." But we have not mentioned the quality which in his mind connects *La Liberté* with *The Tribune, The Post,* and the rest. "No Parisian journal," runs the advertisement before us, "has a greater variety of contents, or more extensive and reliable correspondence. *C'est le journal américain naturalisé.*"

—A work which might almost be one of a species is the "Culturhistorisch-politische Studie" of Dr. v. H—st, published by Engelmann at Leipzig, which treats of the effect upon the development of civilization in Russia of the attempted assassination of the Emperor by Karakosoff, April 4, 1866. The thesis is that this crime produced a reaction in the mind of the government in reference to national education, and altered abruptly and unfortunately the shape that the new reforms were taking. Had the author waited a little he might have predicted the consequences, for Russia or for Poland, of Berezowski's recent attempt on the same monarch in Paris—the assassin, by the way, bought his weapon on the *Boulevard de Sébastopol,* through which street courtesy forbade that the imperial guest should be conducted on his arrival. Incidentally Dr. v. H—st conveys a good deal of valuable information about the present state of Russia. It is left for some one else to trace the results of the attempt on Francis Joseph in 1853, of young Blind's idle shooting at Bismark, of Orsini's bombs, etc., etc. From all these examples the same inference will be drawn without straining, that they only confirmed the *régime* which they sought to overthrow. Nor could any other lesson be educed from the Booth conspiracy, which from its success would perhaps be ruled out of the foregoing category, as it certainly would from its motives; but there would be a wide field for speculating upon what would be the present relations of the South to the Union if Mr. Lincoln had survived the 14th of April.

—A well-known art-critic of Munich has just put forth the first volume of a new life of Raphael ("Raphaël: von Ernst Foerster." I. Band. Leipzig, 1867), adorned with a fine steel engraving of the great painter's self-executed portrait at Florence. The book opens with an historical sketch of the times in which Raphael lived, and then proceeds to his biography, enumerating his works as far as they are pertinent to the narrative. Next follows a distinct review of his works, which the author divides, according to their subjects, into three periods. A chronological catalogue is placed at the end of the volume. The second or last volume will contain a continuation of the review. —Two of the three volumes of Prof. Ebertz's compendium of the early history of Prussia ("Geschichte des Preussischen Staates bis zum Regierungsantritt Friedrichs des Grossen") have appeared, and extend to the year 1740. Especially interesting, though complicated enough, is the account of the founding of the now powerful state on the plains of the "Mark" between the Weser, the Elbe, and the Oder. Here we may trace the rise of the Zollern family, of Swabian origin, who are now the ruling house of Prussia, and for whom a fresh career seems opened on the Lower Danube. It is a curious fact that Rudolf von Habsburg's elevation to the throne of the German empire was chiefly due to the recommendation and support of his relative, Count Albrecht von Hohenzollern-Hohenberg.

—"Poesias de la America meridional, con noticias biograficas" is the title of a neat little book, the twenty-second volume of the "Colleccion de Autores Españoles," published by Brockhaus, at Leipzig. It is divided under the following heads: Religion, Naturaleza, Iuventud Amor y Amistad, Dolor, Romances, Poesia jocosa. A South American anthology has long been a desideratum among those whose reading has included the poetry of the Hispano-American populations, and who have discovered in it great beauties and still greater promise. Collections similar to that of which this volume is the latest part have also been published by Brockhaus, from the works of modern Portuguese, Italian, Polish, and Russian authors. Mr. L. W. Schmidt is the New York agent for the German house.

ON THE HEIGHTS.*

In spite of the somewhat heavy and ungraceful translation in which it is presented to American readers, "On the Heights" is a very charming novel. It depicts modes of life entirely different from our own, but these are treated so simply and the book is kept throughout so low in tone, to borrow a phrase from the studios, that the inevitable strangeness of a foreign novel is, in this case, a thing understood rather than felt. The characters also belong to uncommon types, but are, nevertheless, very genuinely true to human nature. They are distinctly individualized without presenting any of those sharp contrasts which offend the artistic sense in ordinary novels, and have, moreover, a certain reserved force, as though they came into existence before the book which introduces them to our notice, and would continue to live after their peculiarities had ceased to interest us. They are, of course, thoroughly German; somewhat slow in movement, susceptible to ideas, and quite capable of being moved by them even in the midst of passion.

The scene of a great portion of the book is laid in a German court, and the story hinges upon the illicit passion of the king and the Countess Irma von Wildenort. There is, however, none of the mire through which readers are ordinarily dragged in stories of this sort. The whole thing is translated from the region of passion into that of thought, and the severe morality of the book, deriving its sanctions from the intellect instead of the creeds, is rather Pagan than Christian. That is to say, it suggests Shakespeare's line,

"They say best men are moulded of their faults,"

and forces upon us the theory that not innocence but nobleness is the highest moral state.

We do not wish to do this book the injustice of telling its story in a hasty and necessarily imperfect manner, and shall merely indicate its main current, in order to speak intelligibly of the thought which underlies it, and honorably distinguishes it from the rank and file of recent novels. The story turns, then, as we have said, upon the requited love of the king for a maid of honor to his queen, a woman not only as young and beautiful as her rival, but even equally beloved by her husband. She is, however, a woman full of romantic feeling, and lives habitually on heights of sentiment and enthusiasm which the king finds slightly fatiguing. Irma, on the other hand, has a charming vivacity, a fine and untrammelled intellect, and an aversion to all laws but those of her own nature, which make her attractive by contrast with the queen, and doubly so by sympathy with the king, whose individuality seems to him also the most precious of his possessions. For Irma the queen has an admiring friendship, which is threatened at one time by suspicions concerning the nature of her relations with the king, but which is strengthened when suspicion is lulled by observation of their

* "On the Heights. By B. Auerbach. Translated by F. E. Bunnett." New York: Leypoldt & Holt. 1867.

unembarrassed manner toward each other. At last, however, an anonymous letter from the court informs Count Eberhard, the father of Irma, of his daughter's ruin. A stroke of paralysis results from the shock, and Irma is summoned to his bedside. Unable to speak, he traces on her forehead with his dying finger a word which sets her degradation before her in so overwhelming a light that, convulsed with shame and grief, she resolves upon suicide. Letters sent her by the king and queen, urging her return to court, only strengthen her resolution, and she confesses to the queen and takes leave of the king in replies which, as they are short and characteristic, we may as well quote :

"QUEEN : I expiate my guilt with death. Forgive and forget.
"IRMA."

And to the King :

"MY FRIEND : I address you for the last time. We are treading a false way, a terribly false one. I expiate my guilt. You do not belong to yourself. You belong to her and to your whole state. You must expiate in life, I in death. Compose yourself ; agree with the law which binds you to her and to the community. You have denied both ; and I—I have helped you to do so. Our life, our love, has brought upon you a terrible fate. You could no longer be true to yourself. You must again become so, and that entirely. Dying, I impress this on you, and I die gladly if you will abide by my entreaty. Everlasting nature knows that we did not wish to sin ; but it was so. My judgment is written on my brow ; inscribe thine in thine heart and live anew. Everything is still before you. I receive the kiss of eternity from death. Hear this voice and forget it not ! but forget her who calls to you. I wish for no remembrance."

These letters throw a bomb-shell into the midst of the king's domestic arrangements. The queen had long been the only person at court who was unaware of the true state of things, and she had been kept from the knowledge only by her own purity and her confidence in that of others. Her anger and contempt for those who have violated her trust are doubly bitter for this reason. She upbraids the king with the deceit practised on her, and declaring that his guilt and Irma's death must always remain a barrier between them, lives thereafter in a state of virtual separation from him.

Irma, however, is not dead. Almost at the moment when about to accomplish her design of suicide, she was saved by Walpurga, a peasant woman who had lived for a year in the palace as nurse to the crown prince. Walpurga is a charming character, full of naïveté and goodness, and some of the most delightful writing in the book concerns her and her household belongings. With her Irma lives on a farm in the mountains for four years, occupying her time in carving on wood, and her thoughts in speculating on the problem of her existence. The results of the latter occupation are given in a journal kept by her, which forms the most remarkable portion of the novel. Its peculiarity is, that it takes the question of sin out of the domain of conscience, and finds its significance without referring it to arbitrary standards. The results are practically the same as those achieved by the lesser moralists of the religious novels ; but the processes by which they are obtained have the great advantage of having been conducted on universal principles. In this journal is also enunciated distinctly the thought which is the key-note of the book—that the highest culture of the individual demands his subordination to society, that true freedom is found only in obedience to law. The theme of sin and expiation is one constantly recurring in fiction ; but we remember no instance in which it is treated on grounds so lofty. We all know how Hawthorne used it—the positive form in which evil appeared to him, and the terrible immortality with which he endowed it. His books, therefore, notwithstanding their artistic power, are utterly morbid and depressing. Like his own Hester Prynne, we chafe and grow rebellious under the too heavy yoke imposed upon us. Mr. Auerbach, on the contrary, does not outrage the individual, although he rigidly circumscribes his individuality. His heroine, voluntarily shut out for years from all companionship with her equals and all intercourse with books ; with the memory of her sin always before her, and saying to herself, "I will quietly bear the consequences of my actions alone by myself, looking for no material or spiritual help from without," has the rare courage to contemplate things as they are, and arrives at last at a state which is neither resignation nor despair, but a calm serenity in which the outworn consequences of the past drop from her, and she has a right to say : "Whatever may have happened, it is atoned for. There is a renewal of life, a deliverance achieved out of ourselves."

Perhaps a novel teaching a lesson like this is necessarily a result from a wider culture than that which English and American novelists have attained. When these latter are moral they are apt to be Puritanical, and when they exhibit a tendency to become philosophical their liberalism usually degenerates into license. But Mr. Auerbach's novel is conceived in the sphere of pure ideas ; it is at once delicate and strong, daring and yet profoundly appreciative of limitations. How justly, for instance, is the question of culture touched in this passage :

"I cannot regard work as the highest prerogative of man. The noble man is he who is idle, who cherishes and nourishes himself and develops himself ; thus do the gods live, and man is the god of the creation.

"This is my heresy. I have confessed it. But in the chair of confession there sits another being, and he is right when he says : Well, my child, to do nothing—merely to be here—that would be the worthiest and sublimest. Very right. But as no man can be here without another working for him, then each must also work. All must be satisfied. None are here merely for the sake of being, nor others merely for the sake of working."

The following paragraph, with which we close alike our notice and our quotations from this novel, inevitably suggests the fatal defect which marred the peculiar genius and varied culture of Henry Thoreau, and is the most searching criticism on the thought implied in such a life and such work as his :

"We cannot be subjects to nature alone. He who obeys his law of nature has no share in the historical world, no heritage ; for him no one has lived before him, no one has prepared, as it were, his existence ; his whole nature is born with him, and with him it dies. He who obeys the law of nature alone, and persuades himself that he is doing right, is a denier of humanity ; he denies that there is a history of the human race of which he alone is not the only representative, but which was before him and is without him. The denier of humanity is, in spite of all varnish, only a savage ; he stands without. Everything which he does and produces and enjoys, connected with culture, he has stolen ; he should sing no song but the natural effusion of his own voice ; like the bird, which brings with him into the world his plumage and his song, having no especial garb and no especial melody, for all in him is species, all is the law of nature."

MR. HEWETT, MRS. GAGE, AND OTHERS.*

WHEN small fruits, jams, and other sweet things are handed about for adult acceptance, a man has it feelingly brought home to him that he is further off from heaven than when he was a boy. Then it is that he finds, and sighs to find, that his coffee, his cayenne, his olives, his fish-sauce, his soda-water, his wines, and his bitter beers—all the sad stages in his progress "from the caster to the gutter," to use the acrid phrase of a certain social reformer—have taken from him his ability to enjoy the natural, simple delights of the unsophisticated palate. But now and again it happens that habit falls from him ; once in a while, though but for a moment, nature reasserts herself ; he deliberately goes backwards to assorted candies, he fills his mouth with the goodness of honey, and the cloying sweetness is in itself delicious, and also sweetly for an instant it recalls his days of callow greenness. The reader of the first poem on our list will get from its perusal a pleasure quite similar to this that we have mentioned. It is only necessary to forget a little and do a little violence on one's self and Mr. Hewett's poetry becomes a thing of joy. For example, if a man will but remember the days of his youth, it is not at all hard to take delight in this sort of a description of a banquet at Washington, D. C. :

"High at the board where thickest was the glee
Sat Rudiger, the wildest reveller,
The redolent Muscadine was in his brain."

And it recalls one's early, golden visions of department clerks and special correspondents to read this, which is how they do it at a later stage of the same banquet :

"Now shouted one 'Unto his lady each
A bumper pour !' And whispered he who sat
By Rudiger, his closest friend, 'Begin,
As fit, with hers, thy dainty Adelaide's.'"

But let us begin at the beginning, and tell intelligibly what Mr. Hogg would call "the sum total of the whole." Rudiger, who is a Pennsylvanian or New Jerseyman by birth, is a pallid student and a poet and a votary of fame—particularly a votary of fame :

. . . . "That steadfast soul
Spurned all for fame, throttled his pleading heart,
And flung the violated victim on
The shrine of his devotion and his life.
He crushed that bosom, with relentless heel,
On which love's most luxurious feast he 'd held."

And all for posthumous renown. What he studies we are not specifically told ; but he is in the habit of sitting up all night over tomes. Seven days in the week the aureate dawn looks in at the casement of his boarding-house, and makes pale his taper as he peruses olden lore, his brow rimmed with a thoughtful glory. As a poet, he is of the order which may be de-

scribed as hot and strong. In his capacity of votary of fame we have spoken of him just above, but for the story's sake we add a word more. In his thirst for the airy phantom he leaves the haunts of his childhood, and becomes the private secretary of one of Columbia's leading sons, whose residence is at the national capital. In his native Pennsylvania lived a maid who loved our Rudiger, and in return he loved the maid with all the warmth of his passionate poet-nature. "Give me thy lips" he more than once says:

> "Give me thy lips! Thy moon-gilt hair floats o'er
> Thine ivory neck; those swimming violet orbs,
> Great lakes of love in which I'd freely dip,
> Again thy lips! Thy moist palm thrills to mine."

But his love of fame carries him to Washington. The senator or representative into whose service he enters, when he leaves his home and his Sybilla, has a queenly daughter, got up, if we may use the expression, "regardless of expense" both in dress and in personal appearance. Her sumptuous form was clad in emerald silk one morning when she called upon Rudiger at his room:

> "An India shawl fell lightly from a neck
> And shoulders statuesquely beautiful;
> Her radiant face and splendid hazel eyes,
> Full of fine crystal gleams, were softened by
> A snowy veil of rarest frost-work lace."

And thus to the private secretary spake the ox-eyed queen:

> "'Sir Student! fair good morrow,' said she, 'I
> Am peeping in to get a glimpse of this
> Dull oyster here. Nay, shrink not in thy shell.
> Wilt thou to church with me?'"

They go to church, and in the pew are joined by the statesman, Adelaide's father, who points out to Rudiger the new poet, who, as he says:

> "Doth sway the fickle fancy of the world.
> . . . That fragile youth
> With the pale, swarthy face and lustrous eyes."

Adelaide, during the morning service, repeats to her companion a tale of fiery love which she had read in this young man's volume:

> "A tale of passion of a maid who loved
> A youth who knew it not, but, too, himself
> Loved her with wild idolatry."

The application of the story is plain; the selfish statesman sees his account in an alliance with the young eagle Rudiger, and by-and-by the fortunate young man, who, meantime, has got a commission as Indian agent or postmaster, or secretary to a Senate committee, through the fascinating influence of the Lady Adelaide, forgets his early love, Sybilla, and marries the haughty daughter of the senator or representative. Sybilla, of course, dies, but, of course, not till after writing from Pennsylvania a reproachful but forgiving letter. This missive falls into the hands of Adelaide:

> "The post arrived, and unto Adelaide
> By dangerous chance the letter was consigned."

The address being in a woman's hand, Adelaide opened the letter. Rudiger, coming home not long afterward over the Washington branch of the Baltimore and Ohio Railroad, is at once confronted by his injured bride, who hisses into his ear the sibilant name of the martyred Sybilla. Rudiger's conscience awakes, he flees into distant realms, wandering by sea and land for many moons, his soul a perfect mass of scoriæ and lava, and his language always of the highest class. "Straight on to hell," for example, he says,—

> "Straight on to hell the currents drift me fast.
> In hell I will not deign to mingle with
> Those coward fiends who cast the blame of their
> Denunciation on their Maker. I will sit
> Apart, a solitary demon, while
> My great crime and my moanless fortitude
> Shall give me lofty place there;"

for he ever was a deep-browed votary of ambition, and when he cannot serve as Indian agent and eventual Secretary of the Interior, he very naturally feels like annexing himself to Tophet, and doubling the area of that kingdom. He comes out of this bad frame of mind, however, for one night at sea, when

> "The torpid moon hung green and livid in
> A mouldy cloud, as in a festering shroud,"

a tall man comes on deck from the ladies' saloon, and boldly accosts the wretched wanderer, shrinking not from his fearful language nor his brow of doom. He goes back to Adelaide, who has ceased to be haughty, and seems to have become a sort of a nun—at any rate, she is constant in attendance at church—but she does not see her way clear to live with Rudiger, unless he can say that he loves her more than he loves the phantom Sybilla. This, of course, he cannot do. Sybilla holds his heart, and he for ever goes away from Washington in the employ of the American Society for Foreign Missions. In short, "The Votary" is delightfully silly; not stupid merely and dull, but redolent of extreme youth and many thrilling romances; and Mr. Hewett is to be congratulated and envied as the gentleman who, having reached the age of twenty—we judge of this point by his literary skill—yet is endowed with all the toploftical sentiment and all the pleasing vacuity of thought o thirteen years of age. We sincerely advise our readers to purchase and peruse his poem.

A work of a very different class is "Ellen," a brief poem which is written in Spenserian verse, and which, in other less obvious characteristics of its style, is even absurdly Elizabethan. But it is full of thought, and it is by no means empty of genuine poetry. Briefly told, the story of it is this: A young man finds himself at night in one of the parlors of a house occupied by women of the town. Led thither by a friend who has imposed upon his ignorance, Horatio is filled first with disgust and then with pity for the wretched inmates of the dwelling. In one of the rooms he finds Ellen. His presence, which breathes chivalry and manly purity, recalls this unfortunate to her better self. She rises up and goes away with him into the street without a word, is cared for by some good women, and is at last taken home to her parents. The poem seems to be founded on an incident that actually occurred, and though on account of the very great involution of the style, the not infrequent refining subtlety of the thought, the word-hunting, and the wasteful and ridiculous excess of imagery, it is almost all of it hard enough reading, there are some really fine things in it, which must have been written by some one not only of a good heart but of true spiritual insight. If, as we take it, the author is a young writer, we think a good deal may fairly be expected from him. But he will have to give up the use of his borrowed style. These following stanzas must be read with more attention than is given to most contemporary poetry, but, on the other hand, they are worth reading. They describe Horatio's presence and its effects in the midst of "that friendless company":

> "And those banned, lonesome lost ones, they were saved,
> A moment saved. A moment their soul-ache
> Stopt beating, when the woman new was laved
> By the resurging spirit, as in a lake
> Of soft absolving light, and thoughts that raved
> Around infected prison-walls, now take
> Repose,—stilled in that manly presence pure,—
> And tune themselves, again serene, secure.
>
> "E'en in the most unsexed of all, whom years
> Had more and more in fleshly bands enwrapt,
> Through smeary eyelids, long unwashed by tears,
> A light (chaos with primal day-beam capt)
> Strange glistened in the unhallowed lap of leers,
> A soft maternal light inaptly apt,
> Ray from a blessing that had failed to bless,
> Sole flower in a hot weedy wilderness.
>
> "In younger days she lost an infant boy,
> And the dead babe had grown within her mind
> (Angel asleep mid sensual tumult's joy),
> Until by such mute secret nurture kind
> He came to manhood, so without alloy
> She seemed in this fine form her child to find:
> And when Horatio touched with grief she saw
> She trembled, and her heart stood still for awe.
>
> "Horatio's heart grew faint with tears."

Of Mrs. Gage we are unwilling to speak. We prefer to be severe with our readers and in place of criticism give them these few lines. The whole book is like these:

> "To-day the sun shines fair,
> And on the air
> The warmth of almost everyday life is borne
> And tree and shrub are shorn
> Of all their glittering brightness.
> The white clouds float in lightness,
> And the glad heart is radiant in the glo
> Of a bright winter day;
> And men go to and fro,
> Whistling their merriment as if 'twere June,
> (How changed the tune!)
> They laugh and chat,
> And all of that."

And we are entirely unable to see why Mr. White should have printed his book. He knows he never would have thought of publishing it if it had not rhymed; and if it had been his fate to be aware of the enormous amount of equally well rhymed matter that is issued yearly from the press, it must be that a man of his excellent intentions would have refused to add another thin duodecimo to the heap.

SWINTON'S TWELVE DECISIVE BATTLES.*

Mr. Swinton's "Campaigns of the Army of the Potomac" is a book of great value, but it hardly fulfilled the expectations that were raised when it became known that he was engaged upon it. It was and is the best book in existence upon its subject, but it was not so good as it ought to have been. With all its various merits it was disfigured by partiality, while the superior weight which it showed its author inclined to give to all statements

* "The Twelve Decisive Battles of the War: A History of the Eastern and Western Campaigns, in relation to the Actions that Decided their Issue. By William Swinton, author of 'Campaigns of the Army of the Potomac.'" New York: Dick & Fitzgerald, 1867.

made to him by Southern soldiers, discredited it in no small degree for the use of those who believed that Southerners were apt to be somewhat unscrupulous in giving their testimony whenever a question as to the comparative prowess of North and South was involved. His "Twelve Decisive Battles of the War" is a book of unequal merit, but on the whole we are inclined to regard it as quite superior to its predecessor. It is comparatively free from most of the graver faults of that volume, it shows equal research and at least equal skill in the use of materials, and, though it has many defects of style, it is in many parts a book of intense and absorbing interest.

The preface declares that the book is designed more for popular than professional instruction, and states the author's opinion that the proper rule of judgment to follow in selecting from the throng of battles those which may be pronounced decisive, is "to choose such as settle the fate of campaigns, the possession of great strategic points, the capture or dispersion of armies, the success or defeat of grand invasions, and, in brief, such battles as, though not final upon the war itself, were final upon the successive stages through which the war was fated to pass." Mr. Swinton admits the probability of a difference of opinion as to the correctness of his selection. In our judgment he has been extremely successful in it. There seems to be no room to doubt as to eight of the battles which he has chosen for description. There is more room for question when he inserts the names of Vicksburg, the Wilderness, Atlanta, and Five Forks in his list of decisive battles. The first was a siege, the issue of which may be said to have been rendered certain before it was formed by the successes gained by Grant against Pemberton in the field, and Mr. Swinton admits that it is doubtful whether the operations of the siege "hastened the final *dénouement* by a single day." The Wilderness seems to us to have been in no sense a decisive battle, and, according to the author's own reasoning, it was rather the fact that Grant went forward after it, than anything in the battle itself, that caused him to give this battle a place in his volume. Atlanta was the prize of a campaign of four months, counting from the time when Sherman commenced his march from Chattanooga, and was not gained by the sharp battles fought before the city. The victory at Five Forks was brilliant and complete, but the question whether if that battle had never been fought Lee could have succeeded in forming a junction with Johnson is too large for discussion here. But such speculations as these are for the student and not for the mass of readers.

The tone of the book is satisfactory. The writer appears to have been in a much better humor when he wrote it than while he was at work upon the "Campaigns of the Army of the Potomac." His treatment of prominent officers is more impartial and more just, in our judgment, as a rule, than that of his former work, and the few lines in which he speaks of Sickles's great mistake at Gettysburg are a model of candor and moderation. Our fallen natures cannot but feel a satisfaction when we read of General Halleck as "exercising, for the country's sins, the functions of general-in-chief;" and to those who have studied the military history of General Burnside with attention it is no matter of surprise to find his command described as "passing the day (of the battle of the Wilderness) in a fruitless course of peripatetics through the woods." His portraitures of Sherman and Thomas are elaborate and most interesting. With fewer and lighter but artistic strokes he delineates the military character of Rosecrans, and he does not fail to do justice to the sterling services of Buell, the man who turned the defeat of Grant's army at Pittsburg Landing into a victory for the North.

It is easy to find elsewhere as good or better material for studying the battles of Bull Run, the Antietam, Gettysburg, the Wilderness, Atlanta, and Five Forks than is contained in this book; but we do not know where else to look for descriptions of Fort Donelson, Shiloh, Murfreesboro', Vicksburg, and Nashville so good in matter and manner. The author's plan of dividing each sketch into three sections, which he calls the prelude, the battle, and the results, is excellent, and possesses all the merit which he claims for it, namely, that it enables him to explain the train of events which led up to each battle and the circumstances under which it was fought, to describe the battle itself and to show what it accomplished or failed to accomplish, and to introduce a continuous thread of description, running from the beginning to the end of the war, whereon are strung its twelve decisive battles. The chapters which have pleased us most are those on Shiloh, Murfreesboro', the *Monitor* and *Merrimac*, and Nashville.

The book contains many striking sentences and paragraphs, which want of space alone forbids us to quote. The description of the manner in which "Grant's army woke to the battle of Shiloh" is fine, though a little stilted, and a single sentence concludes, with effect, the description of the first day's terrible fighting: "Then night and rain fell on the field of Shiloh." This is Homeric in its simplicity, and the picture is perfect. The whole prelude to Hampton Roads; the paragraph in relation to the fine conduct of Reynolds at Gettysburg, on p. 328; the description of the advance of Pickett's division, on p. 343; the paragraphs which introduce the description of the campaign of Atlanta, on pp. 404–5; the account of the commencement of Sherman's march to the sea, on p. 436; the sketch of Schofield's battle of Franklin, on pp. 447–8, and of the first assault upon Overton's knob in front of Nashville, on p. 462, are all noteworthy as striking passages. The first two pages of the prelude to Five Forks, pp. 478–80, are a good specimen of sustained eloquence. Rapidly reviewing the events which led to the concentration of the great armies of North and South in and near the "historic campaigning-ground" of Virginia, the author, in one ringing sentence, announces the appearance on the scene of the great army of the Mississippi, and, sketching its triumphant history from the beginning, brings it forward to the time when its long marches were nearly over, so that "when the doomed Confederate armies, compassed in fatal toils, looked southerly for an outlet of escape, there came rolling across the plains of the Carolinas, beating nearer and nearer, the drums of Champion Hills and Shiloh."

There is very much to praise in all Mr. Swinton's writings. He collects his material with industry and uses it with skill. He has been much with the army, which in itself gives him great advantages for writing of it, and he seems to have a good theoretical knowledge of the art of war. He is a clear, forcible, and dramatic writer. Unfortunately, we do not know just how much confidence to repose in his accuracy. We give him the credit of taking pains to be correct; but he is certainly sometimes inaccurate, sometimes careless, and he sometimes exaggerates excessively. Thus he says, "The light of day, the 17th of September, broke with tender beauty over the lovely valley of the Antietam." The truth is that it was a dark, dismal, lowering morning, though the sun came out bright by half-past ten or eleven o'clock. His account of the experiences of Sedgwick's division of Sumner's corps at the battle of the Antietam is all awry, and he has either entirely misunderstood the statement of General McLaws in regard to it, or that officer himself is all wrong in what he says. We speak that which we do know, and testify that which we have seen. Again, in one place he declares that the capture of Fort Donelson "carried forward the whole Union front of war two hundred miles." A few pages later, speaking of the fall of the same place, he says, "the recoil was slight." He always speaks of Gettysburg as being in Western Pennsylvania. We find more fault with him for his exaggerated statements of the condition of the Union army after it had been defeated under Pope. He says that at that time the "broken fragments of two Union armies lay on the Potomac like the stranded wreck of a noble fleet;" that "the broken battalions of the once proud Union army reeled and staggered back to the fortifications of Washington," and speaks of it as a "shapeless mass" and a "panic-stricken mob." This would be in bad taste if it were true; but it is not true. It is the grossest exaggeration, and unpardonable at this late date. Such statements have been too often made, and too seldom contradicted. The truth is that the rear-guard, posted near the crest of a slope running across from the Centreville pike to and beyond the Little River pike, in advance of Fairfax Court House, saw the Army of Virginia and the Army of the Potomac pass by in retreat. There was no disorder, no confusion, no unseemly haste. The position of the rear-guard was maintained without molestation from the enemy until well into the forenoon of the 3d of September, 1862, and for a long time after no troops, not even cavalry outposts, were left in their front. Then they received the order to withdraw as quietly as possible, and they moved to the rear in good order. They found the village of Fairfax Court House occupied in considerable force. In front of it, in a line across the road, were twelve guns in battery, and on the left of this line of artillery was a large body of cavalry, massed in the shade of a cleared wood, the troopers all mounted and sitting steadily in their saddles, and looking workmanlike. Everything was quiet, orderly, and as it should be. Far on the right, as one faced toward the enemy, near the Vienna road, was a very solid-looking force, no doubt intended to protect the army against a continuation of Jackson's movements by the left flank. The troopers moved on in good order, and took up the positions that were assigned them, near and in front of the works covering Washington. Though few men living, probably, can speak with authority of the condition of every part of the army, there are plenty who know that there were many divisions and thousands of men who were not demoralized, and perfectly ready to fight stubbornly in defence of Washington, had the enemy advanced upon them there. Such misstatements as those we have noticed seriously impair the confidence of the reader in other statements of the author as to events that took place on a more distant theatre, and as to which accurate knowledge is not easily attainable.

Mr. Swinton's reputation is high and his books are readable, so that it is necessary to examine his writings with more care than that bestowed on the works of authors of less merit. He might perhaps make himself the first writer on military subjects in America; but to attain that position he will certainly have to use more simplicity of style and a little more careful scrutiny and weighing of his authorities in the composition of books which are so valuable and interesting as his "Twelve Decisive Battles of the War."

Nature and Life: Sermons by Robert Collyer, pastor of Unity Church, Chicago. (Boston: Horace B. Fuller; Chicago: John R. Walsh. 1867.)—The intrinsic interest of this volume would be very much enhanced were it preceded by a short sketch of the author's life. Throughout his own denomination his story is so generally known that such a sketch was probably considered needless by his publishers. They would have done well, however, to take for granted that this volume of sermons, which might better be called a volume of poems, will go outside the Unitarian denomination. For though incidentally it touches upon most of the disputed points among the sects, and sufficiently identifies its author with the radical wing of his own sect, yet the broad humanity of the writer, his ready sympathy, his recognition of the superiority of true religion over all its forms, and last, but not least, the poetic quality of his thought, bespeak for him a hearing with all earnest men. As much as Mr. Beecher, he belongs to all the sects. His style is perfectly original, sometimes at the expense of clearness and precision. He is evidently a man of wide reading, but it is men rather than their ideas that delight him. He has a keen eye for the sources of character. His handling of the Bible will doubtless be considered very free, but it is also truly reverent. He humanizes everything that he touches, and the men and women of the Bible as they move across his pages are just as real as those we meet in business and society. To some extent the book is autobiographical, but, though often speaking of himself, these references will always bear the touchstone of good taste. Born in Yorkshire, England, in 1823, the son of honest laborers, spending six years in a factory and twelve more at the blacksmith's forge, then coming to this country and for nine years more still working at his trade; going to Chicago in 1859 as minister-at-large and soon making his mission into a large and prosperous society, his experience has been necessarily broad and rich, and some of the best fruits of it are reported in this little book. He is at the present time, beyond a doubt, the most popular preacher of his sect, and this, too, without stooping to any of the tricks by which popularity is often bought, and without having any of the graces of the orator. A delicious humor runs through everything he says. The plan of his sermons is very simple. They consist every one of them of a dilemma and its solution. The statement of the dilemma generally occupies more space than the solution. This, too, is perhaps a fault. But it is one that is atoned for by the refreshing and consoling views of life that characterize the volume as a whole. By the way, we recommend Mr. Collyer when he quotes poetry not to quote from his unaided memory, which, apparently, is treacherous, but to have recourse to the originals.

Lectures on the Nature of Spirit and of Man as a Spiritual Being. By Chauncy Giles, minister of the New Jerusalem Church. (New York: Published by the General Convention of the New Jerusalem.)—The writings of Swedenborg are so voluminous that many persons who would like to know something about what he believed are deterred by the apparent hopelessness of the task. To read carefully all that he ever wrote would take full as long if not longer than it took him to compose it. And though by any compilation or second-hand knowledge of him we doubtless lose much of the aroma of his thought, yet, all things considered, the general public ought to be very grateful for succinct and definite statements of his views. In this handsome volume of 200 pages Mr. Giles has given such a statement of one branch of his master's thought, and that the most characteristic. He has brought eminent ability to his task. His style is clear and forcible; he does not seem to doubt what those do who doubt nothing else, that brevity is the soul of wit. The topics discussed are the nature of spirit and the spiritual world, the death, resurrection, and judgment of man, his preparation for his final home, his state in heaven and in hell. The leading thoughts are Swedenborg's, but nothing more. No appeal is made to the authority either of the Bible or the Swede. The attempt throughout is to prove that certain leading thoughts have intrinsic probability and reason on their side. The discussion is conducted in the best possible spirit. It may fail to convince any one who is not convinced already, but it cannot fail to interest any person who has ever thought upon these strange, intoxicating themes. The author's style, out of kindness perhaps to the uninitiated, is much less technical than the style of the New Jerusalem generally.

Bible Teachings in Nature. By the Rev. Hugh Macmillan, author of "First Forms of Vegetation." (New York: D. Appleton & Co. 1867.)—The prevailing epidemic among writers is a love of nature and a delight in the discovery of natural laws. Almost every class is more or less infected. Just now the preachers seem to illustrate most forcibly the ravages of the disease. But it is a poor figure that we use for such a noble tendency. It has done great things for art and poetry. It is now doing great things for theology. The writer of these sermons is evidently an enthusiast in physical studies, and has studied them to good advantage. His pages show that he has pushed his investigations a goodly distance into various fields. As the author himself suggests, the book is in two parts. The first eight chapters describe various natural phenomena for the sake of their own beauty; the last seven chapters have a purely typical significance. It will probably be agreed by all that the first chapters are the best, though all the chapters have some degree of interest. And yet as sermons we can hardly think that any of these will rank very high. A sermon is as distinct a sort of composition as a dramatic or a lyric poem, as distinct if not as great a work of art as a statue or a symphony, and these sermons do not answer to the tests by which as such they should be measured. They are terribly overburdened with facts and information. They are all stitched somehow to the Bible; but the stitching makes a very awkward seam. We certainly would not exclude scientific illustration from the pulpit, but we would subordinate it to the religious idea. The scientific feeling is one thing and the religious feeling is another. Mr. Macmillan has apparently much of the first and little of the second. He should have been a botanist or a geologist. His sermons are good; but they indicate that he would have done better service in some other capacity than his present. And we must say that his sermons would be twice as good if they were only half as long.

The Caxtons. A Family Picture. Sir E. Bulwer Lytton. 1 vol. 16mo. "Globe Edition." (Philadelphia: J. B. Lippincott & Co.)—"Books that you may carry to the fire and hold readily in your hand," says Dr. Johnson, "are the most useful after all;" at any rate a man likes his favorites for fireside companions, and no doubt the publishers are wise in giving us the standard novelists in cheap and portable form. As regards the judicious combination of cheapness, portability, legibility, and beauty, this "Globe Edition" of Bulwer we think better than any of the many new cheap editions with which the public has recently been made so familiar. To compare it with two of the best known, we should say, in the first place, that it is perhaps not quite so elegant in outward appearance as the Diamond Dickens; but it may almost be read by firelight, and to read the Diamond Dickens at the fireside one needs gas and very good eyes. And the Globe Bulwer, too, is certainly an elegant book; its paper is not thick, but it is fine and of an agreeable tint, the type is large and clear, and the volume is of a very handy size. The Globe Dickens is easily readable, though the paper is necessarily thin, but it is hardly a book that one holds readily in the hand, and it is not so handsome to the eye as the Globe Bulwer. Messrs. Lippincott & Co. have every reason, then, to be satisfied with their success in a difficult task. "The Caxtons," the volume before us, contains two good illustrations. The other volumes of the series are advertised to appear at short intervals.

Plutarch on the Delay of the Deity in Punishing the Wicked. Revised edition. With Notes by Professors H. B. Hackett and W. S. Tyler. (New York: D. Appleton & Co.)—We are extremely glad to welcome a new edition of this work, not only on account of the value of the treatise itself, but also on account of the admirable manner in which the editorial portion of the labor has been performed. For a correct appreciation of what is required for an American text-book to be used by American students at the present time, Professor Tyler's books have always been remarkable, and the present work will, we believe, fully sustain his previous reputation in those respects, as well as that of the distinguished scholar whose name appears with Professor Tyler's upon the title-page. The Moralia of Plutarch have hitherto been too much neglected in our American colleges, and we have been much gratified to learn that more attention has been paid to them of late at Cambridge. We hope that this book will prove effective in awakening a permanent interest in writings which in many respects are among the most interesting which have been transmitted to us from antiquity.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

THE JULY SESSION.

CONGRESS has just afforded, by the sensible view it has taken of the work now before it, a remarkable proof of the advantage members derive from coming in contact with their constituents. As a general rule, the wisdom of the body diminishes in the direct ratio of the length of its session. The longer it deliberates, the more completely it seems to get out of sympathy and communion with the people, and, as might be expected, the bolder and more enterprising it becomes, the more eager for novelties and *coups de théâtre*, the readier not so much to advance but—to borrow a term from Senator Wade's recent happy description of his own mental condition—"to jump forward." The reason of this is not very far to seek. There is only a very small body of men in either House—there is, for that matter, only a very small body in any deliberative assembly in the world—who either act on fixed principles or have any fixed principles to act upon. Their guide in debate as well as in legislation is what they hear of the sentiments of their constituents, and their means of acquiring information on this point are very imperfect. The party organs, which constitute their principal reading, are obliged by the law of their being to speak strongly, to speak, in fact, far more strongly—or perhaps we should rather say violently—than the mass of the party either think or feel. Not one man in a thousand ever rises to the same level of enthusiasm as his newspaper. He doubtless reads the burning "editorial" with satisfaction, and is willing to say amen to the editor's fiercest denunciations or most gorgeous proposals, but he nearly always does so with a secret feeling that somehow he is not himself quite up to the mark—that he does not accept it all in the literal sense of the words, and that he would on the whole regret very much to see the editor rush off and put what he had been saying into practice. The average citizen listens to the bolder stump-speakers in very much the same frame of mind. He applauds, and is a good deal wrought up in the hall while the speaking is going on, but he cools down before he gets home, makes distinctions and modifications and exceptions which would be fatal to a bold, root-and-branch policy. But of all this the Congressman, of course, sees nothing. He reads the speech, sees that the meeting was largely attended, that the applause was loud and frequent, or reads the glowing and "loud-resounding" article, and remembers that the paper in which it appears reaches 70,000 or 100,000 readers, and concludes not unnaturally that every one of them swallows it as gospel, and he then looks round for some bold move which will be worthy of all these brave words.

One might suppose, at first blush, that any errors he might be led into in this way would be corrected by private correspondence, just as we all here at home have to have the notions we form from the newspapers of the state of things at Washington corrected by private letters from intelligent observers on the spot. But in this the member of Congress is also unlucky. The quiet, steady men who compose the bulk of the voters hardly ever write to him, or think of writing to him. He receives, no doubt, an enormous number of letters; but they are generally either from persons who have ends to be served by deluding him, or from excitable, nervous people who feel strongly in politics, and are constantly impelled to lend a hand "in the good work," and can, of course, seldom find anything better to do in aid of it than writing vigorous letters to some senator or representative, generally cheering him on, telling him he cannot go too fast, and describing to him the glow of enthusiasm with which the writer "watches his noble efforts," etc., etc. We suppose there is not a prominent man of either party who has not hundreds of these in his drawer, or would have them if paper were not in such demand for lighting fires and for pulp for the mills. But they are, of course, almost utterly valueless as indications of the drift of public sentiment—how valueless, we might illustrate by the way in which many well-meaning Congressmen have been deceived by them during the last three or four years.

Perhaps there has been nothing, however, for which the people have given such unmistakable signs of their desire as that the Reconstruction process should be performed thoroughly and once for all; that whatever amount of coercion and violence was necessary for this purpose should be resorted to, but no more. Consequently, all the harsh measures proposed by Mr. Stevens or others, as mere displays of virtuous indignation or merely for the purpose of carrying out a theory of government or of democracy, have all perished untimely. They came up thick as flowers in a clover-field last year and the year before, but they have one by one died out, and their authors have fallen more and more into the background. We mean no disrespect to two able and excellent men for whose honesty and humanity we have the sincerest respect, though we have constantly to differ from them on questions of means, when we say that the contrast between the influence wielded by Messrs. Boutwell and Stevens now and in the winter of 1865–6 is a striking illustration of the small hold which doctrinaires of any school have on the popular mind. Nobody who has during the last year seen anything of the community outside the circle of extreme radical politicians has felt that impeachment or confiscation had the least chance of success or had any popular support. There was something about them both which the average American in his own house never could take to except in some tremendous crisis. We see now, every day more and more, too, that the average American will not, and cannot be persuaded to, make sweeping political or social changes all at once without a good deal of talk about it, and without trying many experiments. It took much time and talking to bring the public up to the level of the Constitutional Amendment, and they refused to go further until the South had rejected it. The present Reconstruction bill is experiment the second, and nothing can be plainer than that until this has been tried and failed the popular sentiment will not sanction the trial of anything else. People feel that in a matter of such moment it is only step by step that they are competent to advance, and that nothing but plain proof of the necessity of the case will justify in the eyes of posterity the momentous precedents which they are now establishing.

All this members of Congress feel in their bones after they have paid a visit to their homes, and they are consequently proof just now against all the arguments of the doctors of the *à priori* system, like Messrs. Stevens and Sumner, who are sure that they know on general principles what ought to be done and who cannot bear the experimental method. We doubt if any member at all in sympathy with the people went back to Washington last week without feeling that the sole object of the July session was the amendment of the Reconstruction process which was determined on last session, and that all attempts to change this process for something else before it had been tried, or to make legislative excursions into the region of finance, or to frame general propositions either in politics or morals, would alarm and disappoint the country. Both Houses accordingly resisted all attempts to launch them on the open sea of general legislation, and are about to confine themselves exclusively to the work of making the Reconstruction act an instrument, as nearly perfect as circumstances will allow, for getting the South into the Union.

We look on this incident, trifling as it may seem in itself, as a most valuable indication of the power and activity of the popular common sense which has so many times saved the country for freedom and humanity—that common sense which, vulgar a quality as it may seem, is the very thing which after all makes constitutional government possible amongst us. Freedom has no warmer friends than *à priori* politicians, but the worst defeats and humiliations she has ever had to undergo have resulted from her trusting to them for safety.

NATURE "AN AGRARIAN."

IN addition to the terrible waste of war, and the loss caused by the withdrawal of so many strong hands from their accustomed farm-work, the country has for three years in succession been afflicted with indifferent or actually poor harvests, so that the price of bread and all other necessaries of life had risen this spring to threefold its normal figure.

and laborers and mechanics, while receiving extravagant wages, scarcely earned a fair living. Strikes and combinations of laborers and of employers have been frequent, the old battle-cries of "the rich against the poor," and "labor against capital," have again been heard on all sides, and the country has been recently startled by the sudden uprising of the agrarian ghost, at the bidding of Senator Wade, who is reported to have said that property is too unequally divided, and that Congress should find means to remedy the evil. The evil itself is no doubt partly due to the war, partly to ignorant and selfish legislation, but mainly to a succession of poor crops. This latter cause seems likely to be soon removed, for all accounts agree that the country is this year blessed with an abundant harvest. Wheat in the Southern and Central States is harvesting, and everywhere else is safe beyond all but the most extraordinary contingencies. The area planted in all the States is larger than ever before, and the yield promises to be liberal in proportion. The hay crop everywhere is magnificent. Corn, though rather late, in consequence of the cold, wet spring, is looking extremely well, and, under the influence of the favorable weather of the last two weeks, is rapidly making up for lost time. Cotton has had its drawbacks; the corn has this year engaged the planter's first attention, but the breadth of cotton sown is large, its present condition is highly favorable; the rumors of damage have from all quarters, except some of the lowest overflows, been indignantly contradicted; the present labor system is working admirably, and without very decidedly unfavorable weather, the crop promises to be far larger than last year, or indeed any year since 1861. With the exception of a few of the smaller fruits, and some comparatively unimportant products, the same abundance seems to await all the crops in all parts of the country. How is this abundance to affect the people?

The first effect of abundant crops is, of course, to lower the price of the articles harvested. Within the last sixty days flour has declined fully twenty per cent.; wheat, nearly thirty; and corn, nearly forty per cent., and the fall is scarcely begun. Cheap wheat means cheap bread; cheap corn means cheap poultry, cheap pork, cheap eggs; cheap hay means cheap milk, and cheap butcher's meat. All that the people eat declines in price, and the decline is not only prospective, but actual and instantaneous. The decline affects not only the crops about to be harvested, but every portion of former crops remaining unconsumed. The great profits made by dealers and speculators were made by the rise on the stock on hand; the stocks now on hand must be sold at a corresponding loss, and thus the profit is taken from the pocket of the dealer and speculator, and restored to him from whom it first came—the buyer and consumer. This is the way in which Nature forestalls Mr. Wade, and provides for a more equal redistribution of property.

When food is cheap, the laboring man is willing and able to work for lower wages. Hence, with cheap food, all that labor produces declines in price. Manufactured goods, the principal cost of which is labor, decline with the price of food. The stock on hand, produced at high wages, declines at once in anticipation of cheaper future production, and thus out of the savings of his high wages the laborer can buy the manufacturer's costly products as cheaply as if his own wages had always remained at their former low figure. Thus again Nature tends to "agrarianism."

Not only does the labor decline by which manufactured goods are produced, but the raw material from which they are made declines with it. Cotton has fallen thirty per cent. in three months, and is still declining. With the price of cotton the price of all other materials used for clothing must fall likewise, and thus every dollar of unnatural profit made on the rise of cotton and cotton goods, wool and woollen goods, is restored to its rightful owner by the gentle, peaceful pressure of Nature's own agrarian laws. Thus, whatever lowers the price of food, lowers the price of everything produced by labor. Abundant crops make lower prices not only for the articles harvested, but also for manufactured goods of every description; not only for the crops about to be harvested, but for any portion of former crops remaining unconsumed; not only for goods yet to be produced, but for every piece of goods already manufactured that remains unsold. Hence it is safe to say that the general anticipations of a profitable fall trade, based upon the prospect of abundant crops, are not likely to be realized. It seems certain, on the contrary, that the present stocks of goods of most descriptions can only be sold at a loss. Nor are those who anticipate an *early* fall trade likely to realize their wishes. A probable decline in prices is proverbially prone to delay purchases. The buyers of produce are not likely to be in eager competition for the farmer's crops, and the buyers of merchandise will wait until the manufacturer lowers his prices to the last figure. Thus the ordinary trade of the country is likely to be both late and unprofitable. When business is unprofitable, money-lenders are averse to loan. The capitalist is the most timid of human beings. Safety is with him the first consideration. When merchandise or stocks are declining, the money-lender is unwilling to advance on them, and is afraid to trust those who deal in them. In England, where money is to-day loaned at two per cent. per annum on good security, it is almost impossible to borrow money on cotton, or on the notes of cotton-dealers, because a decline in cotton is generally expected. A somewhat similar state of things is in prospect with us. Already, in some quarters, it is difficult for produce-dealers to borrow the money they need in their business, and this difficulty tends to hasten and increase the decline, which in turn only adds to the caution of the capitalist. The result is, that the capitalist, finding it difficult to lend his money at former rates of interest, will accept a lower rate if the security offered is only good enough, and thus abundant crops make money cheap. And, with money abundant at three or four per cent., what becomes of the cry that capital absorbs too large a share of the profits of labor? Declining wages, cheap materials, cheap capital which seeks a safe investment, induce moneyed men to employ a part of their means in building. Cheap new buildings lower the value of old dear ones, and make rents lower everywhere. Rent is one of the heaviest items of expense to all classes in this country, but proportionately far heavier to the laboring than to any other class.

Although Wall Street thinks differently, railroad and other stocks have likewise to decline under abundant crops. The decline in merchandise, and the consequent difficulty of borrowing money upon it, compel merchants and manufacturers throughout the country to obtain the money necessary for their business and for replacing the loss on their merchandise by selling out all their outside investments and securities. The lateness of the fall trade and the delay in moving the crops will cause great competition among the railroads, low freights, and diminished profits. The prevailing spirit of caution will cause many of the hollow shams of the Street to be thoroughly investigated and exposed. The diminished profits of the merchants reduce the bank deposits, or, in other words, the amount of money that the banks can lend on stocks. The preference which in times of doubt will always be given to Governments will likewise exert a depressing influence on railroad and other securities, and the Stock Exchange is likely to see a decline that few anticipate, and that will tend to distribute again some of those enormous fortunes that excite the jealousy of ignorant men, and furnish the stock in trade of political demagogues. The almost inevitable decline in prices of every single article of merchandise and of every kind of property is Nature's way of equalizing the distribution of wealth without the aid of Congress or of strikes or of co-operative societies.

It is an old story that dear bread makes more revolutions than the direst oppression. Cheap food in all ages has done more for peace and progress than liberty itself. Abundant crops this fall will do as much to reconstruct the South, to allay the labor excitement, to harmonize political differences, and to put down agrarianism, as any number of summer sessions or any variety of reconstruction amendments. Few will objects to the negro's voting if he faithfully helps to hoe the corn, and the crop yields enough for both master and man. Who stops to register while the wheat is yearning for the sickle? Will strikes or co-operative societies bring down the price of flour twenty-five per cent. in one month as nature's bounty has done? Who clamors for another's acres while in his own field the corn is growing an inch a night? Who cares for Stanbery's opinion while cotton promises an old-fashioned crop of three million bales? Can the President add a single grain to a single ear of wheat? Will Wendell Phillips's fierce philippics add one boll to the cotton plant? Can Congress secure one day's fair weather to the ripening fruit? Yet they think they rule the world! From all parts of our broad land, from the stony hillsides of New England, made fruitful only by sturdy Puritan labor and Anglo-Saxon ingo-

nuity, from the broad prairies of the West, where the bounteous soil asks only for seed-corn and the reapers, from the sunny valleys of the Central States, but recently vexed with din of arms, from the broad alluvial bottoms and dreamy glades of the South, from all parts alike comes one joyous shout of plenty, drowning with unconscious scorn the petty bickerings and broils of statesmen and politicians as the rolling thunder on the Fourth of July might drown the fitful rattle of torpedoes and fire-crackers.

We have, indeed, occasion for rejoicing. Human wisdom has not yet discovered a means of making war weigh alike heavily on rich and poor. Human virtue lags even behind human wisdom. Hence it is not to be denied that war has fallen most heavily upon the poor, that they are most oppressed by the weight of taxation caused by war. But in addition to the loss by war they have had to bear the loss of crops. Nature and man alike have battled against the poor. For six long weary years everything has tended to accumulate property in the hands of the rich. The men of the people who, like Senator Wade, are taught by their vague, untutored instincts "that property is not equally divided," are nearer the truth than their opponents think. But when they seek for the cause of this unequal distribution their instincts fail them, and when in their thoughtlessness they talk of "Congress distributing property more equally," they simply put their feeble shoulders to the chariot-wheel of Providence. The laws that regulate the accumulation or redistribution of property are made by a mightier power than that of Presidents or even president-makers. Of the laws themselves man in his ignorance has only a faint conception; but we do know that the harvest of each year is one of the instruments by which they are executed. For four or five years past the tendency has been in one direction only, but the wave of accumulation has now spent its force, the wave of redistribution has started on its career.

THE FUTURE OF ROYALTY.

The way in which the coronation of the King of Hungary—one of the most splendid and impressive of the ceremonies bequeathed to the modern world by the Middle Ages—has just been received by the European public; the half-astonished, half-amused air with which the press of all countries has described it, suggest some interesting considerations with regard to the changes which the political as well as industrial movements of the day are working in the prospects of royalty. It has been plain for more than half a century that the permanence and prosperity of kings in Europe depended very much on the success of constitutional monarchy. But it is now generally conceded that constitutional monarchy is not a success. The only country in which it is believed to have succeeded is England, but even there its success has been more apparent than real. Since its establishment there has been only one monarch of fair ability—William III.; and he, and Anne, and the first two Georges, owed the security of their thrones not to the fact that they were constitutional monarchs, but that they kept out the Stuarts. George III. was a constitutional monarch only in name; George IV. reigned by virtue of his father's prestige; so that it may be said that it is only in the case of William IV. and Victoria that the experiment has been fairly tried; and the acutest observers concede that Victoria is one of the last full-blown monarchs England will employ. In the countries which have been tempted by English example into trying it, it has either failed or shown every sign of failing.

All monarchies in the civilized world rest either on the feeling of loyalty or on force. Loyalty is unquestionably a form of superstition which the spread of knowledge and the growth of wealth are killing. The king, as he has come down to us from the Middle Ages, is "the Lord's anointed"—one of a family chosen by God for the work of governing men. His impulses are all noble; he is incapable of meanness, or baseness, or falsehood, and he is blessed with a wisdom far beyond that of other men. He needs counsellors, not because he needs advice, but because he needs to be supplied with facts. Give him the facts, and such is his power of reasoning that he is sure to reach right conclusions. And not only has he been chosen by God for the work of government, but it is very kind and considerate of him to do it. Nothing must be exacted of him; the word duty, as indicating obligation of any kind toward his fellow-men, is not to be used with regard to him. Consequently, when he discharges any of the functions of his office, or holds even ordinary intercourse with those around him, he is said to have "deigned" to do this, to have been "graciously pleased" to do that. Court etiquette is, in fact, simply the expression of the mediæval feeling of the monarch's quality. It is a mistake to suppose it was deliberately originated for the sake of show or of imposing on the vulgar. It expressed the monarch's own sense, and that of those around him, of the relations in which he stood to the rest of the world, of the immense gulf which separated him from his fellow-beings. Nobody was allowed to ask him a question, or to start a conversation with him, or turn his back on him, or sit down, or wear a hat in his presence. Let him be never so stupid, vicious, depraved, cowardly, and selfish, never so plain in person or diseased in blood or feeble in intellect, he was treated as a superior being; and for ages the most intelligent and enlightened portion of the population of every European country was taught, and firmly believed, that a man was never so well employed as when devoting all his faculties to the service of the king—not simply of the king and country, but of the king personally; the king with the country, if possible, but the king anyhow. The great Chatham, whose "eagle face" and trumpet voice held the House of Lords spell-bound, and who to all the rest of the world was a model of imperiousness, always knelt in transacting business with George III., and was stirred to the depths of his soul by a look or word of royal approbation. Scions of the proudest houses in Europe fill menial positions in kings' households to this day with infinite satisfaction—stand behind their chairs, pick up their pocket-handkerchiefs, help them to dress, and make amusement for them, with a profound sense of the importance and dignity of the work.

Now, as long as the tradition of the "divine right of kings" was unbroken, and they were believed to reign by "the grace of God" and not by charter or the national will, court forms were realities; they were acts of worship, a kind of *dulia*, in which the monarch occupied the place of a saint. But this tradition has been almost completely broken, and the reverence which it sheltered is passing away. In England it is perhaps stronger still than in any other country in Europe, owing partly to the long association of the sovereign in the popular mind with order and good government, and to the smallness of the number of points at which the public comes in contact with him, and partly to the respect of all Anglo-Saxons for rank—a respect so deep and so difficult of eradication that it seems inbred. But on the Continent, owing to the numerous political changes which have been occurring ever since the French Revolution, as well as to the growth of democratic feeling from other causes, it has been steadily decaying for half a century; and whether monarchy can exist after its complete extinction is a problem of which the solution cannot be very far distant.

Perhaps nothing has struck severer blows at it than the great number of sovereigns who have been made to order and put on thrones since 1790—the raw material being, in many cases, ordinary men, with whom the public had been perfectly familiar before their elevation, and about whom it was therefore impossible to raise any effectual illusion; and for this the old sovereigns "by divine right," strange to say, have been mainly responsible. The plan which they have adopted of setting up constitutional monarchies, as a mode of staving-off democracy, has been, we venture to assert, a temporary preventive only, and has rendered the ultimate triumph of their great enemy all the more certain. In other words, the old royal houses, such as those of Hapsburg and Romanoff and Brunswick and Savoy and Bourbon, have fancied that when they succeeded in inducing a discontented or rebellious people to accept a new king of their making, who was to reign under a charter, they made their own position all the surer. In reality, they weakened it; the force of monarchy lies not, as they foolishly imagine, in the form of royalty, but in the feeling of loyalty, and for a king newly made there can be no loyalty. Letting the people see a "dynasty" founded by a convention of plenipotentiaries sitting in a carpeted room, with foolscap and steel-pens, and publishing their protocols in the daily papers, is like admitting the faithful to see the priests making preparations for a miracle. Within the present century the world has seen Tom, Dick, and Harry—persons whom it had known

in the streets in shabby clothes, or short of money, or struggling in crowds—crowned and enthroned in Sweden, Belgium, France, Naples, Spain, Holland, Greece, and, last of all, in Mexico, and has seen most of them turned out again and replaced by others.

The effect of this on the popular imagination would perhaps not have been so unfortunate, if some means could have been devised of withholding from the newly-made kings the honors usually paid to the old ones, so as to make a distinction between sovereigns by the grace of God and sovereigns by the popular will; but this was impossible, and would have been opposed violently by the legitimists if the republicans had suggested it. Each newcomer was therefore received with the same ceremonial, and treated with the same outward deference, as if he had come down from the dark ages. But in these days people cannot be successfully imposed on in this way. When you take a young man out of the cafés and billiard rooms, as Louis Napoleon was taken, or out of the ranks of the army, as Bernadotte was taken, and put him in a palace, you cannot, by bowing very low before him, listening to all he says as if it was Solomon who was talking, getting down on one knee to kiss his hands, affecting to look on a note from him as a possession worthy of being bequeathed to your children, or telling the world that he had that morning "deigned" to eat an egg or been "graciously pleased" to put on his coat, or recording as an event of the day his having taken a walk in his own garden, diffuse round him the traditional haze of the old royalty; and what is still more serious, you lessen the strength of the forms for the older monarchs. No legitimist, we may be sure, ever laughs over the etiquette of the Tuileries, without finding his respect for the etiquette of St. James or Schönbruun diminish, and without hastening the day when the old machinery by which the world has so many ages been held in awe will lose all value for everybody.

There is, in fact, no class of persons against whom the realistic tendencies of the modern world tell with more terrible force than against kings. The great soldier of our day is no longer the dashing warrior like Henry IV. or Cromwell, Gustavus, Montrose, or Rupert, who brought broken squadrons back to the charge, and whose waving plume carried fresh life and courage to every quarter of a stricken field. He is not even "the Man of Destiny," with "cold grey eyes," or "Star," or famous overcoat, like Napoleon, who used to ride along the ranks before and after battle, and discharge speeches of burning eloquence on his enthusiastic grenadiers. He is a silent man, like Moltke, who knows half a dozen languages, seldom speaks in any, is rarely seen, and never recognized on the battle-field, and does most of his work in a business-coat at a writing-table in his office, with maps before him and a telegraph at his elbow. So, also, the judge who used to dress like a bishop, immure himself in his own house, whose "gravity" was proverbial, and who was seldom seen in public except on the bench as the high priest of justice, now goes gayly into society, and flirts and dances and dines out, and behaves like any other man of his age. The clergyman and the doctor have undergone a similar process of disrobing, and now neither expect nor get much of whatever reverence is paid them through the effect of forms on the popular imagination. But then the general and the judge and the clergyman and the doctor are real men doing real work in the world, the results of which every man can see or feel. The king stripped of his crown and purple robes, and seated in a common arm-chair, is, on the other hand, the most helpless of men. Everybody remembers Thackeray's amusing picture of the contrast between Louis XIV. "got up" for the day and the same personage in his night-clothes stepping into bed. The modern monarch, by the "national will," has the world at his toilet, and it knows exactly how much of his splendor and dignity he owes to the rouge-pot, the tailor, the barber, and the dentist. He wields power, to be sure, but only a little, and can only wield it through the instrumentality of plain generals and statesmen, whom everybody sees in the streets and meets at dinner.

How long the attempt will be kept up to palm him off on the world as a superior being, by the aid of etiquette, it is hard to say, but we doubt if in the most civilized countries it will be kept up very much longer. Etiquette once gone, he becomes in form as in fact a "chief magistrate," like our own respected "head of the nation," and will have to work for his living, cut down his expenses, and may even be reduced so far as to have to make stump speeches and attend Masonic celebrations. The saying with which the Bonaparte family are in the habit of consoling themselves, and on which they rest their hopes of founding a long-lived dynasty—"le premier des rois fut un soldat heureux"—was, they seem to forget, uttered of a period in which kings found no difficulty in veiling themselves in mystery. Hugh Capet or Rudolph of Hapsburg was not dogged by "special correspondents;" he had not to live under the awful scrutiny of the editorial eye; his biography did not appear in a million "enterprising sheets" the day after he mounted the throne, and his levees were not thronged by "practical men" appraising his clothes and furniture, and comparing them with the things they had at home themselves; he was not surrounded by a swarm of mockers and critics, occupied day after day in analyzing his motives and proving or disproving the necessity of his existence.

IN THE MEADOW.

IDLE, and half in love with idleness,
Caught in the network that my oak-tree weaves
Of light and shadow with his thrilling leaves,
And charmed to hear his easy song no less,—
On the shorn grass I lie, and let the excess
Of summer life seem only summer play,
Even to the farmers working far away,
Where one man lifts and strenuously heaves
A bristly hay-cock up to him who stands
Unsteadily upon the swaying load,
Which, while the shuffling oxen slowly pass,
Touched into wakefulness by voice and goad,
He shapes and smoothes, and, turning in his hands,
The long fork glistens like a rod of glass.

R. K. WEEKS.

PARIS GOSSIP.

PARIS, June 27, 1867.

THE popular fancy, released from the fascination of the Czar's presence, is now running riot in anticipations of the approaching visit of the Sultan and the gifts he is believed to be bringing for the Imperial hosts. At first we heard of a gorgeous necklace for the Empress that was to throw all Western jewellery into the shade; and then we were assured that the Commander of the Faithful would present her with a model, in gold, of the Imperial Kiosk of the Sweet Waters, the trees and flowers being enamelled, the river formed of diamonds, and the tower of rubies, the whole costing two million and a half of francs. Now we are informed that the Sultan has made choice for this visit of presents that will not necessitate any outlay in money, as they are all among his private possessions—for the Empress, an enormous uncut diamond that has been among the heirlooms of his predecessors for three centuries; for the Emperor, eleven magnificent horses from the Imperial stables; and for the little Prince, an extensive assortment of toys, trinkets, and other small objects of Turkish make.

Among the other movements growing out of the main gathering of this summer it is in contemplation to organize an "international literary congress," which will hold its preliminary meeting on Sunday next at the Grand Gymnasium, in the Rue des Martyrs, under the presidency of the well-known romance-writer, M. Paul Féval. We are also to have an international congress for the adoption of a unitary system of weights, measures, and money for all Europe, and a number of international gatherings on a smaller scale and for humbler ends. "Professor Sieurmes," too, the great corn-extractor, has established himself here for the season; and the notorious Madame Rachel, who "enamels" the face, bust, and arms of ladies dissatisfied with the complexion Dame Nature has given them, and occasionally sues their astonished husbands for the price of the operation, is also offering her services to the would-be beauties here assembled. It seems that this renowned "improver" of female charms effects her transformations by means of a mixture which she calls "the crystallized dew of Araby," and which imparts an especial fairness and delicacy to the skin. The women who have passed under her hands would strike beholders as being blessed with remarkably fair and smooth complexions, but nothing in their appearance would suggest in the least the suspicion of this fairness being artificially produced. The nature of the operation has never been divulged, but the "enamelling" is warranted to retain its perfection for six years, provided the *enamellée* religiously abstains from the application of water, contenting herself with an occasional dry rubbing of the enamelled "surfaces."

The various places of public amusement are all ambitious of rising "to the height of the situation" created by the presence of "all the world and his wife" in the "metropolis of Europe." Leotard is disputing the palm with the performers at the American Circus; the Porte St. Martin Theatre is reviving the favorite fairy spectacle of the "Biche au Bois," with the introduction of Batty's lions, which are to be brought on the stage in a kind of large cage (to the wires of whose walls the public eye is desired to be a little blind), which will be raised to the stage from its receptacle in the cellars of the establishment by means of complicated and costly mechanism, that seems to be throwing the "enterprising" manager, M. Marc Fournier, into a fever of anxiety and worry. The police, too, alarmed at the idea of a whole company of lions being introduced into a crowded theatre, have been minutely inspecting all the arrangements for the keeping and employment of these formidable brutes; and the public stops amazedly as it passes the hole which has been made in the wall of the theatre to give them air, on hearing the hideous roaring that every now and then startles the street from its propriety.

A musical novelty, particularly interesting to the lovers of Mozart, is to be brought out to-night at the clever little theatre of the Folies Parisiennes—the said novelty being nothing less than a comic operetta called "The Goose of Cairo," left unfinished by the great *maestro*, and just brought into appreciable shape by an accomplished young French musician. It appears that the libretto of "The Goose of Cairo" was accepted by Mozart before he began his immortal "Don Juan," when he was about thirty years of age, and in the full splendor of his power. The poem of "The Goose" was in three acts; and Mozart, in the course of a few weeks, composed the music of the first two acts, when he laid it aside, to devote himself to the composition of "Nozze di Figaro," the libretto of which had meantime been brought to him. "The Goose" was thus left in a corner for a year, during which period the great composer thought only of Cherubino and the Countess. In 1786, the "Nozze" being finished, Mozart was about to resume the composition of "The Goose" when he received the libretto of "Don Giovanni," and "The Goose" was once more laid aside. Four years after the completion of his *chef d'œuvre*, the *maestro*, who seems to have forgotten "The Goose," wrote his Requiem, and passed away, leaving the operetta buffa *minus* its third act. The manuscript was found among his papers, and a few of its airs have been executed at Prague, in concerts. But no musician would venture to take up the unfinished work of the great artist, and "The Goose" has remained unknown to the public for the last eighty years. The French composer who is now bringing it out, having found it on a recent tour in Germany, among other relics of Mozart, in the hands of one of his heirs, and being delighted with the beauty and brilliance of the music, has cleverly cut down the libretto, so as to reduce it to two acts instead of three, has adapted the music to the shorter poem thus obtained, and has brought the work to a triumphant completion without changing or adding a single note. The new operetta opens with a very beautiful quatuor and ends with a splendid septuor with chorus, the entire music being sparkling, graceful, melodious, and *savant*; a musical *bijou* of the first water, every way worthy of its composer's fame.

Byron's old flame, the Countess Guiccioli, now the widow of the late eccentric senator, the Marquis de Boissy, is just bringing out a volume of the poet's unpublished letters, edited by M. de Lamartine, whose state of health seems to indicate his being near the close of his earthly career; and our great culinary high-priest, whose *menus* have been studied daily by all France, for two years past, has now cut his connection with the *Liberté* and the *Figaro*, and is about to issue a daily paper, to be called *Le Baron Brisse*, and devoted exclusively to the teaching of the culinary art, as adapted to all classes, from the millionaire to the humblest possessor of anything cookable.

Fine Arts.

THE HARVARD AND YALE MEMORIAL BUILDINGS.

WITHIN the past year designs have been adopted, by the Committees of Alumni of Harvard and Yale Colleges appointed for the purpose, for the buildings to be erected in memory and honor of the graduates and students who fell in the cause of the country during the late rebellion; large sums have been subscribed for the building, and building committees have been appointed to direct the works. At Cambridge it is intended that the Memorial Hall should include a monumental antechamber, a great dining hall for public occasions, and a theatre for academic assemblies. At New Haven the building is to serve as the College Chapel, and the design provides ample and appropriate spaces devoted to memorials of those who sacrificed their lives for the life of the nation. Each of the designs adopted is the work of skilful and educated architects, each has merit and dignity, and each fairly enough represents the highest level of architectural art in our country.

As yet neither building is begun; the plans are still in some measure provisional, the details and working drawings of neither have been elaborated, and some time may elapse before the corner-stone of either will be laid. We propose, therefore, to take advantage of this pause, to submit to those having the buildings in charge some general considerations which seem to us worthy of attention, and some special reasons why neither of the plans ought to be executed without serious modification of the original designs. We do this the more readily because those who are most interested in these buildings are the men of highest culture in our community, and consequently are fitted to recognize the force of considerations which the mass of the public is not sufficiently educated to appreciate at their full weight.

In erecting buildings which are to stand permanently as memorials of our respect and honor for our dead brethren, we are bound not only to build worthily of their dear memory and of our own grateful and tender reverence for them, but also with reference to the effect of the edifices upon the hearts and imaginations of the future generations of youth who will gather within them, and who will pass some of the most critical years of their lives under the shadow of their walls. There are few buildings in any country, or of any age, whose function is more important than that of these will be, or whose effect is more impressive than that of these should be. To fulfil their object perfectly, or as perfectly as is possible with the resources at our command, these buildings should be alike beautiful in every part, and absolutely thorough in execution. They should be entire works of art and honesty. They are to commemorate the love of ideal beauty, and utter devotion to the truth; and in order fitly to commemorate this beauty and this truth, they must represent these qualities in construction and design.

Not a single building exists at present in America which embodies such thought and imagination as to make it of any great worth to the present or future generations. Architecture properly understood and properly practised is one of the most effective agencies in the development of the faculties of man. A great and noble building is the material representative and expression of great and noble thought, imagination, and moral sense. It is a work of genius embodied in a form in which it appeals directly to the eye, and through the eye to the moral sensibilities. Its object is not merely to afford a shelter, but to delight, to elevate, and to purify men. It gives dignity to life not only by its own fitness and beauty, but as a visible monument connecting the past with the present, gaining with every year new associations which add to its effect upon the heart, and by degrees invest it with an almost sacred interest and influence. Like a poem which becomes more beautiful with every repetition, until at length familiarity with it brings it into special relations with the innermost spirit, so time and age give to a building of poetic character a peculiar power, of subtle yet intense force over the imagination and the feelings.

Our colleges are now utterly destitute of noble architecture; they have not one building fitted to awake any deep emotion, except of weariness or disgust; they have not one around which the associations of youth may cluster with delight, or to which the memory of age may return with fondness. They have not one fitted to evoke those faculties of the soul to which it is the object of art to minister; and while professing to be institutions for the training of our young men in all good learning, they have hitherto neglected to equip themselves with means, than which there are none more effective, for the culture of those sympathies and associations which fine architecture is fitted to evoke, and which enlarge, illustrate, and dignify the lessons drawn from books.

There is now an opportunity in our two great colleges to supply, at least in some measure, this defect. But the opportunity may easily be lost, and will certainly be lost, unless those who are called upon to make use of it enter upon their work with a very different sense of the worth of art in education, of the preciousness, the difficulty and rarity of fine architecture, and of the means requisite to obtain it, from that which generally prevails in our country, We may see only another miserable and ambitious failure—failure worse than ordinary because the object to be achieved was higher.

If the Harvard and Yale memorial buildings are to be erected precisely in accordance with the designs now adopted, if they are to be built by contract, and to be completed in a brief term of years, it would be better that they should not be built at all.

The design for the Harvard Hall shows ingenuity, skill in adaptation and

combination, but is wholly defective in that unity and simplicity of organization which is the first requisite of great architecture, and displays little originality of conception or depth of feeling. It would be a big building rather than a great one. But it is unfair to pronounce upon it with a judgment formed from the photograph or engraving of the drawing presented by the architects, and the design ought perhaps rather to be regarded as intended as a general suggestion of the construction deemed desirable, than as a completed and final plan. Moreover, it is to be considered that there were special difficulties to be overcome in the combination of the three portions of the building, and that the architects and the committee rightly devoted themselves at first to obtaining a practicable solution of this main problem. There is, we think, nothing in the design as it now stands to prevent its receiving such essential modifications as may make it serve a good purpose at the beginning of the work.

The design for the Yale College Chapel is happier in its general conception, and possesses the merits of unity of motive and simplicity of organization. Its parts combine to make a tolerably harmonious whole. But the design lacks in variety and abundance of thought and imagination. There is little to distinguish it as a work of original creative power. It is a careful and elaborate construction—a work of intelligence rather than of genius. It has no place in history, as showing the development of the art of architecture. It is, like most of the best Gothic churches of the present day, an ingenious adaptation of old forms to modern uses and requirements.

The Cambridge building will be much the more costly of the two; but to build either of these buildings as well as they might be built, even supposing the work to be done by contract and in a short time, would require at least twice as much money as it is now contemplated to spend upon it. The fund for the Harvard Memorial Hall amounts, we believe, to between $250,000 and $300,000—a very large sum, certainly, but by no means enough to make the proposed building what it ought to be. As we wrote long ago, in speaking on the general subject of monuments, "every memorial building must be rich and ornamental, and even profusely decorated, and it must be built to last for ever. A plain building, well fitted to its purpose, and intelligently designed, such as would make a good alumni hall, would not serve for a memorial. There must be the evidences of lavish expense of money, all well spent, indeed, but also *freely* spent; of beauty sought for itself, and ornament loved for its own sake, and used to dignify the building." The Yale Chapel is intended to cost $150,000. But this sum will not suffice to give it the character which such a building should possess.

Every stone of a memorial hall should bear evidence of its purpose of honor; every stone should be the object of solicitous care, and should receive every desirable adornment. There should be no expense spared either in material or in the use made of the material so far as the ends of art may be served. Every feature of the building should show that patient, inventive, and imaginative thought had been bestowed upon it, and that all the labor needed for its beauty or its strength had been given it. The buildings, to be worthy of commemorating the men whom they are designed to honor, and of celebrating the cause for which these fought and fell—to be worthy of the freedom and the arts of America, and of the great institutions of learning of which they are to be the central edifices, must take rank with the noblest buildings in the world, with those in which other people in other times have expressed their faith, their aspiration, and their highest character.

But to accomplish this, these buildings are not to be put up by contract, nor to be completed in the lifetime of a single generation. If the alumni of Harvard and of Yale are wise, if they possess the large spirit which comes from free and generous culture, they will not hasten to push to an end the great work which has now fallen to their hands. It is a work on which the labor, the wealth, and the genius of a half-century may well be expended. The conception of a great building is one that grows slowly and attains perfection but by degrees, even in the mind of the architect himself. The chief cathedrals of Europe, with which these memorial buildings should be compared, were often a hundred years or more in building. If the architects of the Harvard Hall and the Yale Chapel could but be assured that their designs were to be carried out on the amplest scale, that the work was to demand a lifetime of devotion, that their love for and knowledge of their art and their own personal genius were to find a satisfactory field of exercise, and a reward proportioned to the greatest prizes of professional life—we may be certain that the defects now obvious in their plans will be remedied, that new beauties will be revealed, and new excellence developed. They will be inspired to design and carry on a monument worthy not only of their own highest capacity, but worthy of a regenerated people, and expressive of noblest moods and attainments.

Let these memorial buildings, to which so many of the holiest associations will belong and which may be so precious to all future generations, be built slowly, thoughtfully, lavishly. So only shall we build them better than we know; so only shall we make them worthy of the beloved dead whom they are intended to commemorate.

Correspondence.

A WOMAN IN REPLY TO DR. LIEBER.

To the Editor of The Nation:

Sir: There are two ways in which an argument may be convincing, especially when supported by the authority of an eminent name—in leading men by its force to adopt the conclusions it advocates, or by its weakness inducing them to see what is to be said for the other side of the question. The views of Prof. Francis Lieber on the much-debated question of female suffrage have produced so entirely the latter effect upon me, I found myself when I had finished reading them so much less impressed by the professor's arguments than I should have supposed possible when I began, that I have been led to attempt an examination of objections, which the name of Dr. Lieber justifies one in taking as representative of those brought by intelligent men against the proposed extension of the suffrage.

Professor Lieber begins by denying *in toto* the truth of the theory that the right of suffrage is a natural right, on the ground that "a natural right cannot mean anything but a right (that is, a well-founded claim) directly proceeding from the very attributes of humanity, the nature of men." He then enumerates the various natural rights—those of life, of property, of education and self-improvement; the right of worshipping; "the right of government—that is, of forming political societies to govern and be governed," etc. etc. "The natural rights," he says, "are always observed, at least in their incipiency," and "the denial of them is always met with direct resentment, even in the lowest savage." But the right of voting for a representative stands on a different ground, since "the representative government itself is something that does not spring directly from the nature of man, however natural it may be in another sense of the word—that is to say, consistent with the progress of civilization." The right of suffrage is, therefore, not a natural right, but "a political right, to which Providence has led man in the progressive course of history." What, then, does Professor Lieber mean when he asserts that "the right of government—that is, of forming political societies to govern and be governed," is a natural right, yet declares that the right of each individual to have a voice in reference to the government is not a natural right? This natural right of government, then, in so far as it concerns the individual, is simply a right *to be governed*, which, indeed, no legislation, from the most ancient times, has ever denied to women. The right of a vote in the government of one's own country seems to me, I must confess, "a right (that is, a well-founded claim) directly proceeding from the very attributes of humanity," requiring only, like other rights, natural and acquired, the qualification of some guarantee of a reasonable capacity to exercise it. I agree entirely with Professor Lieber, that the conceptions "that no qualification whatever—neither residence, nor acquaintance with our polity or language, nor untarnished character, nor interest in the commonwealth—should be demanded as a requisite for the right of voting," are "erroneous conceptions;" but it is not to women who do not vote in the State of New York, but to a large number of the men who do, that these disqualifications apply, and they are, therefore, foreign to our subject.

Professor Lieber next sums up, as follows, the grounds on which the extension of the suffrage to women is claimed:

"Withholding suffrage from the women is a degradation of the female sex.

"If she cannot vote, she is not represented.

"Giving the right of voting to the latter would highly improve and even refine our elections, and not unwoman the woman.

"Lastly: Why not? Why should they not vote like ourselves? Are they worse than man?"

He then proceeds with a paragraph of generally received and quite unexceptionable statements as to the gradual improvement effected by the progress of civilization in the social position of women, the heroism displayed by the women of America in the late war, etc., but in the next paragraph we find an argument in answer to the theory that "withholding suffrage from the women is a degradation to the female sex." This, he says, is so far from being the case, that "not accepting the votes from women is as little degradation to woman as women are degraded in those monarchies

in which no princess can ascend the throne, or, we may say, indeed, as she is degraded in England, because she can there ascend the throne only when no brothers of her, even younger than herself, are left to assume the crown. It is a political law which regulates the succession, and no degradation ensues." That is, the *general* theory of women's political position cannot be a degradation to the sex, because it is *no more* degrading than certain *special* applications of the same theory—an argument of which I confess I do not quite see the force, and which looks to me a little like begging the question.

Dr. Lieber next states that "division of labor, as political economists call the very foundation of our whole economy, begins with the division of the sexes, and expands forth as a physiological and psychologic division and distribution of employment, pursuit, and social relations." Very true, but why does the conclusion, that "according to this distribution the political occupation ought not to be assumed by women," necessarily follow from this premise? Suppose an Indian to adopt Dr. Lieber's argument, might he not draw, with equal satisfaction to himself, the Indian conclusion that, as "division of labor begins with the division of the sexes," therefore, men being physically fitted for adventurous occupation, hunting and war, all other work, all that is tiresome, degrading, uninteresting, falls naturally to women? Is not the latter argument as logical as the former, the former consequently as illogical as the latter, though more agreeable to civilized notions? The real argument in Dr. Lieber's mind seems to me simply this: "The division of labor begins with the division of the sexes," *including* in this division a right on the part of *men* to draw the division line where they please, and to declare that because Providence has undoubtedly drawn the line somewhere, therefore the real line must be where *their* enlightenment or convenience leads them to think they see it. But it is in the next paragraph that the eminent professor develops most fully this line of argument, and rises to a strain of warning quite pathetic in its solemnity. "The destiny of the woman," he tells us, "is to rely, to be protected, to harmonize in society with her attractions, both physical and psychological, the jarring elements brought by men from the sterner and not unfrequently coarser pursuits of practical life;" "she exercises, and ought to exercise, much of her beneficial influence by her delicacy and modesty, and her legitimate influence in the proper sphere would be lost were she to enter the arena of politics." "Politics would undoubtedly unwoman her, and her essential character and desirable, nay, necessary, influence would be lost." Truly a fearful prospect! and what a sense it gives one of the value of these political privileges of which women are deprived! We knew already, on the authority of Artemus Ward, that the earth goes round the sun "subject to the constitution of the United States," but it was reserved for Professor Lieber to bring before us the startling fact that a change in the constitution of the State of New York can suspend the action of the eternal law of Providence which regulates the distinction of sex. I had always supposed that one of the peculiarities of an eternal law was a power of asserting and maintaining itself, human legislation to the contrary notwithstanding; it has even occurred to me that to put men and women on a footing of absolute social equality (and without political equality complete social equality is impossible) might be the surest, and indeed the only, way to give full play to the natural distinction between the sexes, and to that very system of mutual support and influence which Professor Lieber cannot believe in more earnestly than I do; but in the face of such an overwhelming prospect for the Empire State, to say nothing of the laws of Providence, I can but turn to some less alarming aspect of the question.

"Is she to vote by mere impulse and feeling, or is she to visit public meetings? Who wishes this of his own mother, his wife, his sister, or his daughter?" Does Dr. Lieber consider the latter appeal an argument, even supposing it to be true? The question is one of justice and expediency if it is anything, and the natural prejudices of the majority against any innovation are not very strong ground on which to argue it. "How would we like," says the professor, "to have a female President, and what would it lead to?" Heaven only knows! but it is to be hoped, in view of such a contingency in the dim future, to nothing worse than we have been led to already of late years by a male one. Dr. Lieber assures us that, "female monarchs, owing to their peculiar position, sometimes form exceptions" to his general rule, else the reigns of Elizabeth in England, of Catherine II. in Russia, of Maria Theresa in Austria, might have tended to reassure us in view of this threatening, though distant, peril.

The remaining paragraphs are devoted to a still further elaboration of the professor's views as to the effect of the suffrage on the feminine character, with the usual argument that women cannot be considered unrepresented because most of them have male relatives who enjoy the privilege of a vote. Far be it from me to desire a change by which women "would be infallibly contaminated." But is it not just possible, seeing the experiment has never yet been tried, that the influence of women on politics might be as great as the influence of politics on women? Is it not just possible that a little influence from politics might be beneficial to woman herself? Is a voice in the government of one's own country necessarily so undesirable a privilege that its effects can only be compared to "those produced in women who enjoy the turf or speculate at the Bourse in Paris?" The argument that women are in fact represented at present, is as absurd as it is untrue, since no class can ever be really represented by another, and the distinction between the sexes forms a distinction of class which no strength of family ties can do away with, but it has nevertheless a certain truth at the bottom of it in this great fact of feminine influence over the lords of creation. Admitting, for the sake of the argument, that women are through this influence as fully represented as men, though less directly, can there be a stronger ground for the extension of the suffrage? The political influence of women, without it, is power without the sense of responsibility, without which no class can safely be entrusted with it, and since the existence of women and their influence over the minds of men are indubitable and inevitable facts, is it not safer for men, for the country, for the progress of civilization, that women should be taught by the privilege of the ballot that they, no less than men, are responsible for the rational use of whatever power Providence has placed in their hands?

I would merely add that this subject is one which, until recently, has been a matter of profound indifference to me; but having in the last few years heard and read various arguments for and against the proposed change, it has seemed to me that all those in favor of it had a rational argument in them, while those on the other side, though urged, as in the present instance, by men whose opinions are entitled to respect, were mere illogical appeals to the prejudices and theories which the received state of things naturally produces and maintains. Such arguments as those of Dr. Lieber remind me so forcibly of the ineffectual clucking of a hen whose brood of ducks are just taking to the water for the first time, that I cannot but suspect that as ducks can swim, so women may be able to vote, without injury.

A Woman.

COLLEGE DEGREES AGAIN.

To the Editor of The Nation:

Sir: It seems to me that the essential vice of our college system of education is not exactly expressed by your words, "the democratic principle of giving the same degree on graduation to the highest and the lowest scholars." For all practical purposes the commencement list, on which are printed the names of the graduating class in the order of their rank in scholarship, supplies the place of degrees of different grades. The diploma itself is, of course, never referred to after graduation except as affording proof that some one whose scholarship was of the lowest order has succeeded in "getting through" college.

The "democratic principle" which governs our colleges aims at forcing the greatest possible amount of study out of a given number of students; to secure which result the recitations and examinations are adapted to the capacities of the lowest rather than of the highest scholars. Hence the student of better parts and more thorough preparation than the majority of his classmates, is subjected to the almost intolerable tedium of hearing lessons which he has well learned blundered and stumbled through with for three hours each day; and on entering the examinations is discouraged by finding the same papers set before him as before those who can have acquired, or should, under a proper system of instruction, have acquired, a far less amount of knowledge. Hence many promising scholars, lacking the iron patience to labor with regularity and diligence in what is to them a treadmill routine, take to desultory reading or to cultivating their rhetorical powers, to which latter course the unfortunately high value placed by our undergraduates upon "literary" honors, as they are called, is a peculiar temptation. The main strength of our college instructors is given not to aiding those who wish to study, either from a desire to obtain knowledge or from ambitious motives, but to forcing intellectual discipline upon those who care for nothing beyond a certificate of graduation. This is obviously unjust to the most capable and conscientious scholars, who certainly have a claim to the best services of their instructors.

Now, if there were no other remedy for this evil than the adoption of the elective system, this course would, probably, be far preferable to the present one. But the arguments brought forward against this system by President Woolsey, in his article in *The New Englander* of October last, in reply to Dr. Hedge's address, are difficult to answer. Most young men of eighteen or nineteen are not competent to choose their own studies.

Could not, then, the desired result be attained by a division of the college class into several different grades, and having different recitations, or at least different examination papers, for those of each grade? It would then be understood that those who have attained the highest rank as scholars have not only recited a certain number of lessons with greater accuracy than their classmates, but have passed over more ground and secured greater acquisitions. And many who, under the present system, are upon leaving college poor scholars and indifferent rhetoricians, would, if some such change were made, become excellent students, and probably in future life more accomplished and efficient writers.

Yours, DELTA.

WEST HAMPTON P.-O., L. I.

AMERICAN LAW REVIEW NO. 4.

LITTLE, BROWN & CO., Boston,

HAVE PUBLISHED

THE

AMERICAN LAW REVIEW.

VOL. I., NO. 4.

CONTENTS:

I. The Limitation of the Liability of Shipowners by Statute. II. The Rights of Action of a Bankrupt. III. Modern Reform in Pleading. IV. Seals. V. Government Claims. VI. Digest of the English Law Reports for February, March, and April, 1867. VII. Selected Digest of State Reports. VIII. Book Notices. IX. List of New Law Books Published in England and America since April, 1867. X. Summary of Events.

Terms: $5 per annum in advance; single copies, $1 25.

Vol. I. (which this number completes) will be ready, bound in law sheep, July 10. Price $6.

This Review, the publication of which commenced Oct. 1, 1866, is designed to satisfy the want, long felt among lawyers, of *a first-rate law periodical*, well executed, and up to the wants of the profession, and worthily representing the literature of the law.

How far in this direction it has succeeded, is best shown by its wide circulation, and the high rank and reputation already acquired. The following are a few of the very many laudatory notices it has received:

"We do not hesitate to recommend this magazine, and cannot doubt its success. . . . The Digest of English and American Reports is exceedingly well done, and is worth a year's subscription every month it appears."—*Boston Advertiser.*

"It is due to such a journal that the profession should patronize it liberally, and contribute to it generously."—*Boston Post.*

"The best periodical of the kind ever published in the United States."—*Boston Transcript.*

"This magazine is conducted with signal ability, and must be of great value to the legal profession."—*N. Y. Commercial Advertiser.*

"This new periodical is edited with ability, and bids fair to gain a high position in the specialty to which it is devoted."—*N. Y. Tribune.*

"The character of the review is well maintained. Its criticisms of men and books are fearless without being harsh. The original matter is well written, and the digests of cases carefully prepared."—*N. Y. Nation.*

Price $1 75 by mail.

MILTON BRADLEY & CO.,

Springfield, Mass.

JEAN INGELOW.

"Every one will welcome a new volume of poems by Jean Ingelow. 'A Story of Doom' is the story of Noah and the Ark, and it is full of dramatic and thrilling passages, such as one hardly expected to find in a poem of Jean Ingelow's, and full, too, of sweet, soft, and beautiful pages, such as one did naturally expect. Yet, perhaps, we like some of the shorter poems better; they are so perfect in their way, so tender and bright and musical. The poem of 'Laurance' is a narrative of the virtue of self-denial and patient resignation, is full of true beauty, and sure to be a favorite."—*London Morning Star.*

The first edition of Miss Ingelow's New Volume of Poems is nearly ready.

"The Nation."

FIFTH VOLUME—JULY, 1867.

With the first number of July THE NATION enters upon its Third Year and Fifth Volume. It is still presented to the public as a thoroughly independent and candid journal, of high tone and liberal views, devoted to conscientious and exact criticism of politics, literature, social and physical science, art, and popular education. In all these departments it will constantly employ the ablest writers in the country, with more or less frequent contributions from abroad. To the scholar, the student, the teacher, to all professional men, to every family, it is confidently recommended as an aid to sound thinking and right living. To Americans travelling or residing in foreign parts THE NATION is peculiarly adapted to be of value and interest.

"I like THE NATION thoroughly, not only for its ability, but its tone. I have particularly liked many of its critical articles, which have seemed to me in every way superior, and level with the best culture of the time. They have thought in them and demand it of the reader—a very rare quality in most of the criticism of the day."—*Prof. Jas. Russell Lowell.*

"I have been a reader of THE NATION since its first publication, and hope to continue to be till it dies, or I do. . . . It is a clear, sound paper. I wish it had a million subscribers."—*Rev. Henry Ward Beecher.*

"Allow me to express my great satisfaction at the course of THE NATION, and to wish you success."—*Judge Hugh L. Bond, Baltimore.*

"Thanks for the discrimination and courtesy which usually mark your columns, and which permit us to hope that it will be possible for an American newspaper to discuss principles without violating proprieties."—*Gail Hamilton.*

"I wish it success rom the bottom of my heart."—*Rev. H. W. Bellows.*

"Peculiarly suitable to the wants of educators and teachers; and hence I omit no opportunity to recommend it among my educational friends. If I could have but one American periodical, I should take THE NATION."—*J. D. Philbrick, Esq., Superintendent of Public Schools, Boston.*

"I am glad to know of the pre-eminent success of your journal. It has a high rank amongst the newspapers and reviews of the day for the firm, bold stand it has taken for the rights of man, white or black."—*Maj.-Gen. O. O. Howard.*

"THE NATION newspaper is an honor to the American press, and a blessing to the American people."—*Rev. Calvin E. Stowe.*

"I recommend your paper to all I meet with, and whenever an opportunity presents itself."—*Jas. E. Yeatman, Esq., Pres. West. Sanitary Com., St. Louis.*

Terms:

One Year, Five Dollars; Clergymen, Four Dollars; Clubs of Ten, Forty Dollars. Six Months, Three Dollars Fifty Cents additional by carrier in New York City; postage additional when sent abroad.

661 BROADWAY.

A BRILLIANT AND STANDARD AMERICAN BOOK.

CRITICAL AND SOCIAL ESSAYS,

REPRINTED FROM THE NEW YORK "NATION."

12mo, cloth, $1 50.

Some of the most valuable and successful books recently issued in England have consisted of essays reprinted from the high-toned critical and literary weekly newspapers which have hitherto been almost peculiar to that country. The publishers present this volume, composed from an American journal which the first scholars of the country have thought worthy to rank with *The Spectator*, *The Examiner*, and *The Saturday Review*, in the full assurance that it will obtain, as it deserves, equal favor and equal permanence with the English reprints of the same description. *The Nation's* staff of contributors embraces so many distinguished names in our literature that a dull or worthless collection could scarcely be made from the files of the paper.

CONTENTS.—1. The Glut in the Fiction Market; 2. Critics and Criticism; 3. Clergymen's Salaries; 4. Popularizing Science; 5. The Good Old Times; 6. Why We have No Saturday Reviews; 7. Tinkering Hymns; 8. American Ministers Abroad: 9. Horse-Racing; 10. Some of Our Social Philosophers; 11. Waste; 12. Dress and its Critics; 13. The Social Influence of the National Debt; 14. Hints for the Fourth of July Orations; 15. American Reputations in England; 16. The European and American Order of Thought; 17. Roads; 18. Pews; 19. A Connecticut Village; 20. Voyages and Travels; 21. Verse-Making; 22. Something about Monuments; 23. Our Love of Luxury; 24. A Plea for Culture; 25. Curiosities of Longevity.

Copies sent by mail, post-paid, on receipt of price.

The Week.

On Tuesday week the House debated the Military bill, Mr. Fernando Wood making a good speech, and pointing out a defect in the act, which Mr. Stevens remedied; Mr. Bingham making a speech which is highly praised for its brilliancy, but of which the telegraph gives us a not very taking summary; and Mr. James Brooks delivering a true "effort," replete with historical illustrations, and, as a specch, absurdly bad; and, finally, Mr. Stevens closing the debate. The bill passed by a vote of 119 to 31. On Wednesday, nothing of interest occurred, except the passage of Mr. Shanks's resolutions ordering a committee of investigation into the treatment of Union prisoners in Confederate prisons—a measure which seems to come late, but will be soon enough for the purposes of history. An attempt made on Saturday by Mr. Mungen to add to these resolutions one ordering an enquiry into the treatment of Southern soldiers in Federal prisons was defeated, the House declaring that charges of such ill-treatment must first come from some responsible sources. It is to be wished, we think, whether there is truth in the charges or not, that the committee had been instructed to cover the ground completely. On Thursday, the friends of impeachment were decisively defeated, and on the same day the Senate Military bill came in to the House, and was referred to the Judiciary Committee; and on Friday it was adopted, only some slight changes, mostly verbal, being made in it. On Saturday, the bill, in the shape in which it had been left by the committee of conference, came back to the House, and was immediately signed.

The Senate has repeatedly had occasion this week to rally to the support of the Anthony resolution excluding general business, Mr. Sumner having assaulted it frequently with a persistency which seems to have given his fellow-Senators considerable amusement. After passing the supplementary Reconstruction bill, which originated in its own chamber, refusing to pass the House bill, and declining to accept certain amendments, the Senate appointed a committee of conference, and the bill was passed substantially as it left the Senate. It declares in substance that the military power is paramount at the South; that the commanders of districts named in the act may remove the civil authorities of Southern towns and States, and may fill the vacancy thus created; that such removals shall be subject to the approval of the general of the army, who also may remove in like manner; that previous acts of removal are confirmed; that boards of registration shall not merely register whosoever will take the oath required, but must enquire and judge of the applicant's qualifications; that the Executive pardon does not remove disability; that the opinion of no civil officer of the United States shall be binding on any district commander, or registrar, or officer acting by appointment of the commander or the registering board, and the true meaning of the oath required is explained fully. Of the intent of Congress there is certainly no doubt now at any rate. Mr. Stanbery's ingenuity and ability will hardly be called into requisition again.

Mr. Trumbull made last week in the Senate the ablest reply to Mr. Stanbery's opinion we remember to have seen, although, inasmuch as a bill was under consideration, which was sure to pass, to make a clean sweep of the Attorney-General's objections, the speech was valuable rather as a vindication of Congress from the charge of hasty and blundering legislation, than as an answer to Mr. Stanbery. Mr. Trumbull cited a case of great pertinence, which we believe has not been heretofore produced in this discussion—that of Cross *vs.* Harrison, decided by the late Judge Wayne—in which the question was raised whether a military government set up in California during the Mexican war was a valid government after the signing of the treaty of peace and the cession of California to the United States. The court decided that it was, and that it rested with Congress to say how long after the state of war had passed away the administrative machinery set up during the war, or as an immediate consequence of the war, ought to be maintained.

Mr. Mungen, of Ohio, made a speech last week also on the Reconstruction bill, which helps to explain how the use of the "previous question" became so popular with the majority. He filled six columns of *The Globe* with a dissertation on race, on the hereditary transmission of physical peculiarities, on the comparative size of the negro brain. If it had been a good dissertation, it would nevertheless have been an outrageous encroachment on the time of the House; but it was not good. It was a string of scraps of information, most of them absurd, strung together by a gentleman who knew nothing whatever of the subject, and he had the assurance to confess, before he sat down, that for "most of the ideas and thoughts contained in his remarks he was indebted to his esteemed friend, Dr. O. White, of Toledo, Ohio." We trust Dr. O. White will stop Mr. Mungen's supply of facts between now and December. If he sends him back to Washington charged in a similar manner on any other subject, he will be guilty of a crime against free speech.

Since we last expressed an opinion about Maximilian's execution, the whole subject has been reviewed by the learned and judicious Mr. Chandler, of Michigan. He divides the people who think the execution was a bad thing into three classes—one, the humanitarians, who are headed by Mr. Greeley; second, the flunkeys, who think princes are better than other people; and third, the rebels who hate the United States. The mental constitution of anybody who after this has any doubts about the matter must be very odd, and would well repay investigation.

In the long report of the trial of Maximilian, which has been translated from the Mexican papers and published here, the prisoner's counsel is made to say that he hesitated about assuming the crown even after it had been offered him by the "Notables," and in his

perplexity consulted "the most eminent English jurists," "and the College of London declared that he was elected by the will of the nation emperor." The learned gentleman then naïvely added "that the jurists of London, as well as the candidate, ignored the means used in Mexico in order to obtain the unanimity of the people by triumphant parties." What "College of London" it is which gives foreign potentates advice as to the title to their thrones, we cannot say, unless it be "The British College of Health," which, though its function is, strictly speaking, the supply of aperient pills, is the only learned body we know of in that city which would be likely, for a consideration, to tell an archduke whether he had been legally elected emperor or not. In this instance, however, the poor fellow was egregiously swindled, as the "College" had not got hold of the facts when it gave its "opinions," a little precaution which we recommend the "British jurists" to take on all similar occasions in future. Some of these gentlemen are, however, really giving "opinions" a little too freely, and Maximilian's case is only one illustration of the disappointment they sometimes cause. The Confederate bondholders, for instance, never meet without having "an opinion" from "a jurist" that the United States is liable for the Confederate debt. Luckily they are not so foolish as to come over with sword in hand to enforce their claims.

We review elsewhere the field of active effort open to such organizations as the Massachusetts Reconstruction Association, whose appeal for support has furnished us our text. To sustain with sympathy, and money, and ideas, and documents, the cause of the Southern loyalists, on the eve of a political campaign and an election whose importance cannot be overestimated, is the aim of the men whose practical sagacity has been more than once exhibited in the past twenty years. In fact, the formation of the Emigrant Aid Society, by which Kansas was saved to freedom, constituted an epoch in the anti-slavery struggle; and it was seen that besides the regular operations of the Abolitionists and the Free-soil party, which could be provided for, or at least were a constant element in the calculations of the South, the party of slavery was exposed to unexpected assaults from still smaller, but more concentrated and proportionately more powerful bodies, that defied calculation and provision. It was a disagreeable and ominous novelty to find men—the late Major Stearns was a good example—who, after giving liberally to the Abolitionists and still more liberally to the Republican party, were ready to contribute as much again for extraordinary service which was not in the line of either of those organizations, but which proved an invaluable auxiliary. The Sanitary Commission was another spontaneous movement which was omitted from the Southern reckoning when rebellion had been resolved upon. The Loyal Leagues were another. The Reconstruction Associations now supplement those which have preceded them, and promise as great usefulness, and probably as great a surprise to the reactionists both North and South. They deserve the energetic support of the people, and, in a philosophical point of view, the attention of those who make our republicanism a study.

Mr. Johnson has discovered another mare's nest. He has formally suggested to Congress the possibility that Congress may, as the consequence of enforcing the Reconstruction act, be compelled to vote the whole revenue required to pay all the governmental expenses of the Southern States, and that the Federal Government may become liable for the whole debt of these States incurred previous to the war. We are afraid Mr. Johnson has been consulting "the College of London" or "the British jurists," by whom the unfortunate Maximilian was induced to believe that he had a good title to the Mexican throne, or he would hardly fall into such absurdities. He surely knows that no government ever becomes liable for any debts except such as it chooses to assume. Congress will have to pay the debts of the Southern States, and to vote money for all their expenses, whenever it pleases to do so, but not sooner. There is no process for collecting money from governments against their will. If Mr. Johnson writes many more messages, we shall be driven into serious misgivings as to the state of his health.

If General Grant could be supposed anxious about the goodness or badness of his chances for getting the Presidency—and for our part we suppose him not at all anxious—he ought to be just at present well pleased with himself, for he has, no doubt, won the approving smile of all unattached old politicians in the country, and must have dreadfully troubled the hearts of those who had cast in their lots with Mr. Wade and the others, or those who, like Mr. Robinson, of Brooklyn, think General Grant may be useful to the "Democratic cohorts." The correspondence between the district commanders on the one hand, and the Secretary of War and General Grant on the other, reveals Grant as considerably more inclined to Radicalism than it has been some people's wish that he should appear. "It seems clear to me," he says in the matter of Governor Jenkins's threatened displacement, "that power is given in the bill for the more efficient government of the rebel States to use or not, at the pleasure of the commanders, the provisional machinery set up without the authority of Congress in the States to which the Reconstruction act applies. . . . . If the power of removal does not exist, then it will become necessary to take refuge under that section of the bill which authorizes military commissions." Nobody on the Republican side in politics will dislike these words, especially those of the last sentence, except people who wish to hear worse ones from that quarter. The correspondence also shows in a very pleasant light the friendship which exists between Sheridan and Grant.

Mr. Andrew Jackson Davis gives a very lame reason why "the summer-land" is not in the neighborhood of Mars and Venus—namely, "because the particles composing those planets are sufficient in quality to make it float exactly away in the place where it is," which is, to our mind, an unsatisfactory explanation. It is not much improved by what he added to it immediately afterward: "It was a grand, natural, reasonable, and wholesome emulation, not only of the population of the globe, but of all globes that have given their portion of particles to the formation of that belt." That belt, as we understand it, is the "silver lining within the cloud of planets," which is where the summer-land really is situate. The scenery of that land, Mr. Davis thought, "must be made of contributions of portions of the harmonies of sceneries of all these different planets." Among these selected scenes walk the population of this and other planets, and Mr. Davis says some of the people he met there supposed themselves to be dreaming. Particularly this was the case with one man who in this life had fallen from a high building to the pavement and been killed; the breath having left his body before it touched the ground, so "it seemed to him that before he struck something caught him, and he was rendered unconscious. It required a good deal of conversation with friends who welcomed him to the summer-land before he could be made to believe himself awake and not dreaming."

A new light in Congress has risen, blazed, and set within a week. On Friday Mr. Robinson, of New York, made the most astonishing speech that ever was made in the House of Representatives, and one of the most astonishing that ever was made by an Irishman. We do not know to what or to whom to compare him. His brain seems to consist in equal parts of the Brooklyn *Eagle*, the American eagle, and the sunburst of his native land. For shame's sake the reporters did not send over the wires all that he had said, and some things that they did send are not to be quoted; but thus, they say, he perorated:

"Mr. Robinson closed his remarks by an appeal in favor of humanity, kindness, and charity to the people of the South, and by quoting and adapting the following from Moore:

> "'O would thou wert near me, my Souther(u)n (*metri gratia*) brother,
> I love thee as dear as the son of my mother;
> I am lonely and sad since the day that we parted,
> My lips have the tone of a maid broken-hearted.
> But come; from the future fresh flowers we will gather,
> And we 'll sing the sweet songs of freedom together.'"

Mr. Robinson wished to offer an amendment making the provisions of the Military bill to apply to Pennsylvania, Massachusetts, and New Hampshire, in which latter State no Catholic was allowed to hold office. He desired to show that in the draft riots in this city an Irishman died in an attempt to defend the flag of his country; that in a fireman's riot at Philadelphia Protestants spit in the faces of Sisters of Charity; that when sausages ruled supreme he himself had, as a newspaper correspondent, been expelled from the floor of the House; that after Washington, Jefferson, and Jackson, Andrew Johnson would stand as the purest and ablest of American Presidents; that the Impeachment Committee had pried into the secrets of the President's family

circle, and had even examined the scullions of the White House; that at the next Presidential election the Republicans would have to adopt the Democratic candidate. Mr. Stevens, with well-timed liberality, did not insist on moving the previous question, and Mr. Robinson came more or less peaceably to the prosperous conclusion above quoted. Mr. Logan followed Mr. Robinson, laughing at him—like an augur—and before he got done said one or two of those things which so much endear him to the average Western man: "If I had been he who captured Jefferson Davis—and Mr. Greeley might publish it if he liked—there never would have been any trouble in trying Jeff. Davis either by a civil or a military court except such a court as he might organize." He knew why the Democratic party hated him. "It was because he had put more of their friends to the sword than almost any other man of his age in the army;" which is, after all, as tall talking in its way as Mr. Robinson's. Finally, Mr. Stevens earned the gratitude of the country by moving the previous question, and gagging everybody.

Mr. William Lloyd Garrison's reception in London has been cordial enough to encourage the belief that there has been a revival in England of devotion to the anti-slavery cause, or rather the cause of weakness, amongst those most faithful to it. The proceedings, too, at a breakfast given him were enlivened by an incident which gave them almost an international character—Lord Russell's confession that Mr. Adams had convinced him that he was wrong in the view he took of the position and aims of the North in the earlier part of the war. Lord Russell has never been remarkable for either tact or perspicacity, but he has all his life long served good causes with a zeal, marred, it is true, by many indiscretions, but which will still entitle him to a high place amongst reformers. This last confession of his error, late as it is, will do much to wipe out the memory of his blunders. Mr. Vernon Harcourt was also present at the breakfast, and was very complimentary to the United States; but he was always shrewd enough not to pin his faith to the Confederacy.

Mr. Raymond's nomination for the Austrian mission has been rejected, mainly, we presume, because the Senate is still in an ill humor about Mr. Motley, for Mr. Bancroft's political opinions are no better than, if as good as, Mr. Raymond's, and yet Mr. Bancroft has, we are glad to see, been confirmed for Berlin. The latter is, by this time, at his post, but he is pursued by the inexorable Greene, "the grandson," whom the historian vainly flattered himself he had squelched. We are glad to see that Mr. Otterburg's chance of the Mexican mission is small, and that Governor Andrew is talked of for it. There is no country in the world in which we keep a representative at all in which we shall, during the next two or three years, need to be represented by a wiser, clearer, cooler, and better-trained brain, than Mexico. Sending Mr. Otterburg there is little better than a bad joke. *The Jewish Messenger*, we are sorry to see, is distressed by our remarks on this gentleman in a recent number. As *The Messenger* in another part of the same paper extolled Judge Cardozo to the skies as one of the most eminent judicial officers that ever mounted the bench, we are relieved from the necessity of making any reply. Judge Cardozo is the person, we may mention, who declared the Excise law unconstitutional last winter.

The Cable newsman on the other side of the Atlantic, as might have been expected, fell easily, last week, into the trap set by some wag in London, by the publication of a despatch purporting to come from Prince Gortschakoff, and proposing a joint European investigation into the condition of Ireland. The hoax was rather clumsily executed, and probably few people except the Cable newsman were taken in by it. He has apparently not yet got over the effect of the Ascot Races, though his account of the reception of "His Sublime Majesty" the Sultan in London is exceptionally sober. If he continues to be as deeply moved by public ceremonies, however, as he has been lately, we feel satisfied that his nervous system will give way, a result which we should be amongst the first to deplore.

There is a strong impression afloat in Europe that the Bishops who are now collected together in Rome from all parts of the Catholic world to assist at the canonization of a certain Arboes, a very bloodthirsty Spanish Inquisitor, who was "martyred" by the relative of one of his victims, will be converted before they separate into an Œcumenical Council, representing the visible church, and armed with all its powers. There is nothing within certain wide limits that such a council cannot do, and the particular thing which in this case it is thought likely to be called upon to do, is to declare the Pope infallible, which, in spite of the popular Protestant belief of the contrary, he is not now. Should it do so, the Pope would be in a position such as no human being has ever been in, and the new dignity would probably prove greater than any human being could support, and the Papacy sink under it. But the chances are that the council will not agree, and that, in fact, the bishops may prove on investigation too unreliable to be called into council at all.

There seems to be some difficulty about the surrender of Maximilian's body. The latest rumor is that Juarez will only surrender it under a treaty. If this be true, he probably imagines he can sell it for something, such as a surrender of some of the European debts. It would not be a bad idea to work on the feelings of the foreign creditors in this way, and it would be thoroughly Mexican. Many a barbarian has proposed to pay debts with his sword, but to wipe them out by disposing of the body of a dead enemy would be strikingly original, and would illustrate the march of civilization amongst the "Latin races" on this continent in a simple and touching manner.

The would-be assassin of the Czar has been found guilty, but with "attenuating circumstances," a qualification which French juries are allowed to attach to their verdicts, and thus save the prisoner from capital punishment. There is very little doubt, however, that had the attempt been made on Napoleon, he would have gone to the scaffold. The mitigation is probably due to an unconscious reflection in the mind of the jury of the strong pro-Polish feeling of the French public. The refusal of the Council of Advocates to punish the young men who insulted the Czar at the Palais de Justice was another illustration of it.

The English House of Lords, we suppose by way of answer to the doubts which have been expressed about its vitality, has just been getting up a debate about the Irish Church, on the motion of Lord Russell for a commission of enquiry. The Church was defended by Lord Cairns and the Earl of Derby on the odd ground, that the title of an endowed corporation to its property, as long as the property is used for the purpose prescribed in the endowment, is as indefeasible as that of an individual to his property, and Lord Cairns was uncivil enough to illustrate his argument by mentioning that the Russell family derived a considerable portion of their estate from precisely the same sources as the Irish Church—namely, the confiscated property of the Catholic Church. One of Mr. J. S. Mill's earliest contributions to periodical literature was an argument against this theory, and we believe it has never been answered. The debate in the House of Lords is evidently but the forerunner of more serious attacks in the Commons.

The story that the King of Abyssinia had shut up a batch of Englishmen, and threatened their lives, because Queen Victoria had refused his hand in marriage, which has had some currency here, never had any foundation in fact. He imprisoned them because a letter which he wrote to England, asking for an envoy regularly accredited to him, was allowed to lie for a year and a half in the Foreign Office unanswered. At this he was naturally indignant, although his mode of showing his indignation is open to objection. All attempts to effect the release of the captives have hitherto proved futile, as his majesty—Theodorus is his name—being totally wanting in respect for heralds, whenever anybody is sent to him to negotiate a ransom claps him in jail too; and one of his favorite amusements is giving the prisoners a cudgelling with his own royal hand. The British Government has now, after eighteen months' trial, concluded that negotiation is useless, and has announced its intention of employing Sepoys to bring the monarch to terms. The chances are that when he hears the Sepoys are coming he will kill the prisoners; but then they are certain to die before long if the Sepoys do not come, so that the use of force seems the best road out of the difficulty.

Notes.

LITERARY.

MESSRS. HURD & HOUGHTON have in preparation a volume, by Colonel James F. Meline, entitled "Two Thousand Miles on Horseback," this long way being the road through Kansas, Nebraska, Colorado, New Mexico, to the city of Santa Fé and back again. Colonel Meline is at present with Major-General Pope in Georgia.——Dr. J. G. Holland has just finished the proof-reading on his new poem "Kathrina," which is to be issued by Charles Scribner & Co., and which, we are given to understand, is addressed rather to the literary and critical than to the general public, but which, if it is not an excessively popular book, will be unlike any of Dr. Holland's other works, unless we except his first novel, called "Bay Path," which is not very well known.

—Mr. Bancroft has fresh cause to regret the decease of President Sparks. In January last he thought, and expressed his mind about it, that if Mr. Sparks instead of Mr. Norton and Mr. Lowell had been in charge of *The North American Review* he would not have been reduced to the necessity of defending himself against the attacks of Professor G. W. Greene. The July *North American* will drag him into the arena again, and we do not very well see how, with due regard to the reputation of his history, he can avoid noticing some very plain language which is printed in the last number of *The Historical Magazine*. "He will remember, also," says the writer last referred to, "that on this very subject [the Greene controversy] he possessed information from sources which he recognized as trustworthy in his treatment of Colonel Reed—although they were far less so than in this, since *that* was hearsay and *this* direct testimony—yet *he has suppressed it when treating of General Greene*, without telling a reason for that suppression or even hinting at the existence of the unemployed material." The italics are not ours. We have not space to give even a synopsis of Professor Greene's forcible and clever letter in the July *North American*. We make room, however, for this sample of it, which is not an unfair one. We cannot call it a good-tempered letter, we do not know that such a letter ought to be very good-tempered, but it is quite dignified, and where the professor is moved to charge the historian with falsehood, he does so decorously in the Latin tongue, afterwards, however, translating the sentences. In the passage that we append Mr. Bancroft's words are at the beginning in italics. It should be said that Mr. Bancroft charges General Greene with taking the quartermaster-generalship for the sake of money-getting. The reader will very much doubt if the context, which is given by Mr. Greene, will allow any such meaning to be given to the letter as Mr. Bancroft attributes to it in the words which we quote:

"'In one of his letters he frankly confessed that the emoluments expected from the Quartermaster's Department were flattering to his fortune.' 'Here again,' says Mr. Greene, 'I ask your attention to the context:

"'The emoluments expected from the Quartermaster's Department, I freely confess, are flattering to my fortune, but not less humiliating to my military pride. I have as fair pretentions to an honorable command as those who hold them, and while I am drudging in an office from which I shall receive no honor and very few thanks, I am losing an opportunity to do justice to my military character. . . . . Nothing but the wretched state that the department was in and the consequent ruin that must follow, added to the general's and the committee of Congress's solicitations, could have procured my consent. It was not with a view to profit, for the general and the committee of Congress well remember that I offered to serve a year (unconnected with the accounts of the department), in the military line, without any additional pay to that I had as major-general.'"

Whatever may have been Greene's object in taking the office, it certainly is not right to twist this letter into a confession of expecting emoluments from it. We have read, we believe, all that has been written on the one side and the other of the historical controversy which at once sprang up on the appearance of Mr. Bancroft's ninth volume, and while we pretend to nothing like exhaustive knowledge of Revolutionary American history, we think it right to say that our confidence in Mr. Bancroft's veracity, or at any rate his accuracy, is very much shaken.

—The first number of Dr. Wm. A. Hammond's *Quarterly Journal of Psychological Medicine and Medical Jurisprudence* (A. Simpson & Co.) appears this month, and makes a handsome brochure of 160 pages. In the department of original communications, the editor, as was to be expected in a first number, takes the laboring oar, contributing three papers: on "Instinct: its Nature and Seat," "Merlin, and his Influence on the English Character and Literature," and on "Organic Infantile Paralysis." The most noticeable selection, to the unprofessional reader, is that from the London *Times and Medical Gazette*. It is an interesting—whoever follows Hepworth Dixon's authority could not make an accurate—article on "Aberrations of the Sexual Instinct," of which the chief examples are derived from America, or, to speak properly, "New America." We fancy it must be from aberration of the classifying instinct that the writer includes in the same series fœticide and the agitation of women for political equality with men, which he calls *androgynism*.—This month also appears, after some little delay caused by mechanical difficulties in obtaining peculiar type, Messrs. Townsend & Adams's reprint of the London *Chemical News and Journal of Physical Science*, a small quarto of 48 pages, having a very wide range of subjects, and, from this specimen number, apparently recommending itself to a large class of readers outside the arts. There is a vast difference in the subscription prices of this fac-simile and the original, in favor, of course, of the former.

—Of late English books at Scribner, Welford & Co.'s, we notice Professor Charles Kingsley's "Ancien Régime;" Sir James Stephens's "Essays in Ecclesiastical Biography," already well known in this country; Matilda Betham Edwards's "Winter with the Swallows," which is a lively book of travel in Algiers; W. Walkiss Lloyd's "Philosophy, Theology, and Poetry in the Age and Art of Rafael;" "A Visit to some American Schools and Colleges," by Sophia Jex Blake. Miss Blake has written a book which will very likely be of service to her countrymen, though it appears at about the same time with the voluminous and valuable report of Mr. Fraser, who was sent over here to do officially what she did from an interest in the cause of education. As might be expected, she praises the American common-school system and pronounces American colleges inferior to those of Great Britain. Of the ordinary stuff of which travellers' books are made she gives her readers little. It is well enough, we suppose, for her to animadvert on the American fashion of smashing up boiled eggs in a glass, instead of eating them from the shell, though where she saw our countrymen pouring milk into the glassful of eggs we do not know. We have seen many States and cities, and observed somewhat attentively their manners, and nowhere have we seen eggs eaten in the way Miss Blake shudderingly describes. The continual vulgarisms in American conversation, even in the speech of those Americans whom Miss Blake knew to be well educated, were also shocking to her, and she expresses her opinion that the reputation for under-breeding, coarseness, and ignorance which Americans somewhat unjustly have acquired, is in great measure due to their carelessness in this respect. Miss Blake prizes highly the courtesy with which she was received by the managers of the schools which she visited, but excludes from her good books the principals of a young ladies' school at Poughkeepsie, who seem to have made on her mind a more unpleasant impression than could have been made by a simple refusal to show her the school in operation. The Marquis of Lorne's "Trip to the Tropics" is a volume of travels of less account than Miss Blake's. The world has already heard how a lecture by Mr. Emerson, which Lord Lorne heard, struck him as being a string of very obscure brilliants. We believe there is nothing else in his book that will much interest American readers. He found a "Fremont Hotel" in Boston, and he thought the members of the Porcellian Club at Harvard very good fellows. Professor Matthew Arnold's four "Lectures on the Study of Celtic Literature," which were delivered as lectures at Oxford, and published as essays in *The Cornhill Magazine*, are now issued in book form, and will soon, we suppose, be reprinted by Ticknor & Fields. "Fine Art, chiefly Contemporary," by William Michael Rossetti, contains criticisms on Millais, Maddox Brown, Turner, Whistler, and many other painters; on Mr. F. T. Palgrave considered as a critic of art; on Japanese pictures, on modern sculpture, and other kindred topics.

—Messrs. Marcus Ward and Company, of Belfast, Ireland, have for some years been training a large body of men in the art of illumination, inspiring them, so far as may be in this utilitarian age, with the spirit as well as the knowledge of the old monkish artists. It is, of course, not often that work is called for of the kind that was done four or five centuries ago, though now and then some such task is required. The life and miracles of Saint Patrick have, for instance, been beautifully done on vellum for Sir Benjamin Guinness, the great Dublin brewer, who, as our readers have heard, gave out of his own purse a vast sum of money for the rebuilding of Saint Patrick's Cathedral. But, generally, the revivers of this pious art have found it more profitable to seek patronage from noblemen and gentlemen who delight in pedigrees and emblazoned arms, from framers of addresses and promoters of testimonials. The Prince of Wales, among others, and the Earl of Hillsborough have given orders. The work, of which there are a good many specimens at the Paris Exposition, is said to

be very beautiful in color, nearly equalling the work of the illuminators who labored on their knees before chemistry was discovered.

—For the fifteen years previous to last month no play of Victor Hugo's had been enacted on the French stage, an absolute interdict having rested on his whole *répertoire*. The prohibition having been withdrawn, the play of "Hernani" was put upon the stage of the Théâtre Français on the 20th of June. Undoubtedly it is fresh in the memory of the author, who does not forget such things, how, away back in 1830, when Paris was divided into two camps, the romantic and the classic, this same Théâtre Français was the scene of a most violent uproar on the occasion of the very first representation of "Hernani." The Hugolâtres were, however, successful in the contest, and the play became a standard one. The scene at its resurrection would have still more delighted the author than the scene at its birth. There was so much applause that the spectators were hardly to be called an audience, for but little that was said on the stage could be heard, and the representation was almost reduced to a pantomime. Everybody applauded. The friends of "the proscribed," of course, were wild. This imposed on the official world also the necessity of becoming frantic, for evidently it would never do to allow the return of M. Hugo to the stage to wear the appearance of a triumph of the peculiar political opinions which he entertains. For once the gifted author would have been satisfied with the fume of incense, and it seems quite a pity that he could not be present to snuff it up. For that matter, he might have been present had he liked. It is told of him, in the scandalizing way which the French carry to perfection, that he is quite often to be seen in this or that Continental town, affecting extreme mystery, and transparently disguised, as if tyrants were hanging about all the railway stations seeking his life-blood. But he was included in the general amnesty of 1859, and there is nothing to prevent his return to Paris.

—The present state of geology has lately been reviewed by Professor Bernard von Cotta, of the Mining Academy of Freiberg, Saxony, in a volume entitled "Die Geologie der Gegenwart" (Geology of the Present Time). The book is written from the vulcanistic point of view, and, after an introduction on the history of geology, it treats all geological questions of the day in well written essays, two of which were translated into English under the title of "Geology and History," and published in London. In chapter vii., "Geology and Darwin," Professor von Cotta attempts to prove that the principle of Darwin's theory of species may well be applied to geology, and that, *vice versa*, geology goes to prove its correctness in general. In chapter x., "Cold Periods and Effects of Glaciers," the author says that the ice-period of Europe and North America coincided, but that the boulders of South America were transported by glaciers of an earlier or a later ice-period. The cause of the ice-period Herr von Cotta agrees with James Croll and Sir Charles Lyell in attributing to the alterations of the eccentricity of the ecliptic. In the same chapter he combats the theory that glaciers could produce valleys or the excavation of lakes. Altogether the work is well worth reading, and the reading of it is facilitated by its being printed with Latin type.——Darwin's theory of the origin of species has been hailed as a new fundamental principle by zoölogists more generally than by students of the vegetable kingdom. Especially was this the case in Germany, where, shortly before the publication of Darwin's book, Virchow in his "Cellular Pathology" had prepared the way by deriving the origin and substance of all organisms from one primitive cell, and all diseases from its alterations. Goethe by his "Metamorphosis of Plants" (1790) had already pronounced views similar to those of Darwin, without, however, in the then state of botany being able to erect them into laws or principles. Following Darwin's theory, the attempt has now been made by Professor Ernest Haeckel, of the university at Jena, to bring the morphology of organisms into a system by his work, "Generelle Morphologie der Organismen" (Berlin, 1866 and 1867; Vols. I. and II.) The first volume contains the general anatomy of organisms, the second volume the history of the development of organisms, with eight genealogical plates illustrating the beginning of the original cell, "its progress to *Plantæ protistæ* and hence to *Animalia*." The author is an anatomist, and the portions of the work referring to botany are consequently not so carefully treated by him as the zoölogical part of his work.——A valuable addition to chemical literature is Mulder's "Chemie der austrocknenden Oele, ihre Bereitung und ihre technische Anwendung" (Chemistry of Siccating Oils, their fabrication and use in the arts; translated from the Dutch by J. Müller, Berlin, 1867). The chemical relations and drying capacities of linseed oil are in this book compared with those of other oils. The principal product of each drying oil is *linoxyn*, which is durable if mixed with inorganic substances. If mixed with organic matter, like *carmine acid* (from cochineal), or with *alizarine* or *purpurine* (from madder), the color does not keep, and Mr. Mulder therefore warns artists who would transmit their pictures to posterity to abstain from the use of carmine and madder lacs. ——A "Scientific Catalogue, or Bibliographical Guide to the Literature of the Sciences," containing the more important publications of Europe and the United States, has been published by L. W. Schmidt, 24 Barclay Street, New York. This catalogue, though chiefly indicating the publications of the last ten years, reaches with regard to standard works as far back as the beginning of this century. It is scientifically arranged, and a table of authors is added at the end containing 1,300 names many of which appear several times, with the numbers of pages referred to, a feature which facilitates the use of the guide and gives it a more than ephemeral value.

YOUMANS'S MODERN CULTURE.*

A DEBT of gratitude is due to Dr. Youmans for this very entertaining and instructive volume. It meets a serious want in the popular literature of our time. We have for some time sorely needed a book in which the subject of education should be philosophically discussed. We have needed a book in which the claims which divers branches of study rightfully have upon our attention should be fairly and lucidly set forth. In the present volume the claims of scientific studies—a very important item in education—are ably, not to say powerfully, presented. The idea of collecting the opinions of various great writers, each an authority in his own province, upon this most weighty subject, was a happy one. As Dr. Youmans rightly says (Pref. p. vii.): "Although the reader may miss in this volume the connection and coherency of a systematic treatise on the subject by a single writer, and even note some minor points of disagreement, yet he will find that each statement is a section of a comprehensive and essentially harmonious argument which presents an attractive variety of treatment while the stamp of various and powerful minds, each speaking upon the subject with which he is best acquainted, must give the discussion far greater authority than the work of any one man, no matter how able, could possibly possess."

The model discussion of the book is Professor Henfrey's on the "Study of Botany." Liebig's essay on the "Development of Scientific Ideas" contains much fresh and vigorous thought. Tyndall's discourse on the "Study of Physics" is also greatly to be admired for its clear and consecutive reasoning and its grand and stirring spirit. Dr. Whewell's remarks on the "Educational History of Science" are sound and valuable, but rather insipid, like most of that excellent man's writings. The extracts quoted from Dr. Draper, Lord Macaulay, and Mr. Goldwin Smith possess little or no merit; but the articles contributed by Dr. Youmans himself are full of interest. The introductory remarks on "Mental Discipline in Education" may especially be noted as among the best things recently said on the subject of liberal education. Except Mr. Mill's superb address at St. Andrews, we know of nothing abler, nothing more powerfully reasoned or more to the point than this introductory essay by Dr. Youmans.

Dr. Youmans begins by pointing out and deploring the defects of the present traditional system of classical education. Inherited from the Middle Ages, shaped in accordance with a theory of the universe which has long been exploded, it has, he says, little or no fitness to meet the demands of our own time. It is of little use in training our reasoning powers, in disciplining our judgment, or in teaching us to estimate correctly the evidence for and against any given proposition. It disciplines nothing but our memory, and that it does in the most irrational and cumbrous way, bringing before us isolated facts in utter disregard of the laws of association. It diverts us from contemplating the great interests of the present time, and brings before us the affairs of a past which we never become able to appreciate, and with which we have little serious concern. We spend seven or eight years in acquiring an imperfect reading knowledge of two dead languages, and at the end of that time we have not only got no available knowledge of the history of ancient times and the spirit of ancient literature, but we remain in utter ignorance of modern history, of political economy, of physiology, and of physics.

There is, unfortunately, altogether too much truth in this view of the case. There is no doubt that our classical education engrosses too much time, and that it leaves us too shamefully ignorant even of the subjects with which it professes to make us acquainted. Indeed, our scientific education, as carried on under the present university system, is not much better.

* "The Culture demanded by Modern Life: a Series of Addresses and Arguments on the Claims of Scientific Education. By Professors Tyndall, Henfrey, Huxley, Paget, Whewell, Faraday, Liebig, Draper, De Morgan; Drs. Barnard, Hodgson, Carpenter, Hooker, Acland, Forbes, Herbert Spencer, Sir John Herschel, Sir Charles Lyell, Dr. Seguin, Mr. Mill; with an Introduction on Mental Discipline in Education, by E. L. Youmans." New York: D. Appleton & Co. 1867.

We take up a book on physics, and are told that the Newtonian theory is still one of the great rival theories of light, although that theory was utterly overthrown at the beginning of the present century. We take up a book on astronomy, and are told that the earth is 95,000,000 miles distant from the sun, although the researches of M. Foucault have shown that the distance is only 91,000,000. We take up a book on physiology, and read about a "vital principle which suspends natural laws," although every competent physiologist well knows that any such "principle" is as much a distorted figment of the fancy as the basilisks which in old times were supposed to haunt secluded cellars. We hear grave lectures on psychology, in which the antiquated systems of Locke or Kant are laboriously expounded, while of the recent prodigious innovations made by writers like Bain and Spencer we get not the slightest hint. So in history we are taught as if Mommsen and Grote had never written. In philology we are no better off. The same tense is called by one name in Latin, by another in Greek, and by yet another in French, to our signal confusion and discomfiture. Grimm's magnificent researches, throwing light upon the whole structure of language, and presenting the history of human thought in an entirely new phase, are utterly non-existent to the mind of the student. He pursues the even tenor of his way in blissful ignorance of Sir G. C. Lewis, and sees no absurdity in the mythological theories of Euhemerus.

Now, it seems to us that the reform which is most urgently needed in our system of liberal education consists not in the substitution of one branch of studies for another as much as in the more liberal, rational, and intelligent pursuit of all branches. Whether we study antiquity in Felton's "Ancient and Modern Greece" or science in Cooke's "Chemical Physics," we are equally wasting our time over profitless and ill-digested details. But, on the other hand, in studying Grote's "Plato" or Grove's "Correlation of Physical Forces," we are truly educating ourselves; we are not only gaining priceless information, but acquiring mental discipline—deftness in the use of scientific methods of research. It is a grave error to suppose that fairness of mind, accuracy of judgment, or shrewdness of perception are to be secured by abandoning one class of studies for another. In the main, these things belong as much to one kind of research as to another kind. The narrowness and torpidity—the "Kronian" characteristics (to use an Aristophanic word)—of classically educated men are due far more to the irrational method in which they have pursued their studies than to those studies themselves. Let the student really fathom who Julius Cæsar was, what he thought, what he did, wherein he differed from Marcus Cato or another, why his policy succeeded, and what its effects have been upon all human generations down to our time—let him duly fathom all this, and he will have gone far toward getting as good a political education as a man needs to have. Let him, again, justly estimate the value of ancient chronology; let him, for instance, intelligently appreciate the fact that much of Bunsen's and Lepsius's Egyptology is but a tissue of air-woven fables, and he will be as little likely to surrender himself to any current delusion as the man who has studied astronomy or chemistry. The trouble is, that our scheme of classical education does not provide for any adequate knowledge even of classical subjects. Its energies are entirely devoted during seven or eight years to the imperfect acquirement of two languages which ought to be thoroughly mastered in three or four. No time is left for anything else. We read Aristophanes, and never suspect his divine, soul-stirring humor. We read Demosthenes, and remain ignorant of Athenian politics. Depend upon it, if we were taught these things differently, if we were to study the classics so that we should recognize Sulla or Pericles on meeting them, we should less frequently be heard to complain of the uselessness of our "college lumber."

The claims of physical science we not only admit, but maintain with all our heart. We have no sympathy with those who look askance upon scientific studies, and pronounce them a mere spending of the time upon curious details. These know not of that concerning which they speak. Nothing can be more atrociously unjust than some of Professor Bowen's remarks in his reply to Dr. Bigelow's pamphlet on classical and utilitarian studies. Not content with defending, by some very able arguments, the real claims which the classics have upon our attention, Professor Bowen thinks his case is incomplete until he has gone on and proved, or rather asserted, that science has no value. It gives us an Atlantic telegraph and a few new medicines, and enables us to have our photographs taken. But what good does that do us? A vast amount, most certainly. To question the advantages of rapid communication is hardly the part of a political economist. Not an improvement is made by science in the industrial arts but helps us to live well and to fulfil more accurately the great objects of our existence. Nor does the chief value of science lie here in its utilitarian, but rather in its philosophical, function. Philosophy no longer rests contented with quiet introspection, but sallies forth to the conquest of the universe. Not one of her theories or her methods but has been metamorphosed under the influence of scientific facts. All these we must know if we would keep up with the knowledge of our times. We must know the new chemical theories, the latest researches on heat, the last word about the origin of species, or all at once we shall find ourselves deprived of some most essential fact when we come to piece together our theory of things. Logically, moreover, our scientific studies are most valuable. They impart to us skill in classification, in terminology, and in the use of hypotheses, accuracy in observation and skill in experiment. They beget in us a wholesome scepticism concerning the all-sufficiency of our mental powers, and show us that some things can be done while others cannot, and teach us that there are such things as laws or uniformities of succession in nature which must not, cannot, under any circumstances, be disregarded with impunity. They nourish in us a religious state of mind, inviting us to approach nature and life with trust and not with fear. But more need not be said. We need do no more in behalf of the claims of science than refer to Dr. Youmans's book, where nearly all that can be urged on the subject is most forcibly urged. For our own part, while recognizing most of what is said in the book as the expression of our own ideas and opinions, we still retain an intense feeling of the indispensable value of the classics. Believing, as Mr. Mill does, that there is no reason, except the stupidity of instructors, why classics and the sciences should not both be taught, we hold that they should both be taught. Our earnest recognition of the claims of the one should never blind us to the claims of the other. We are surprised at one little remark in Dr. Youmans's introduction. Having quoted Mr. Mill's address in behalf of scientific studies, he thinks it proper to add that the same vigorous discourse contains a strong argument for the classics. But while, says Mr. Youmans, "Mr. Mill urges the importance of scientific studies *for all*, an examination of his argument for the classics will show that it is applicable only to those who, like himself, are professional scholars, and devote their lives to philological, historical, or critical studies." An examination of Mr. Mill's argument for the classics will, we believe, show that it is as universally applicable as his argument for the sciences. He does not bring forward a single reason why the classics should be studied which does not fit the case of the dry-goods merchant as well as the case of the college professor. Nowhere in his address does he faintly intimate that he is not putting one class of studies upon the same footing as the other. If Mr. Mill had circumscribed the sphere of classical studies in this singular way, we, believing with Comte, that no man is completely educated unless he can run back through all time as well as run about through all space, should straightway throw down to him the gauntlet of argument. But as Mr. Mill has done no such thing, and we have already filled space enough, we must close by inviting every one interested in the subject of education to read Dr. Youmans's book and Mr. Mill's after it, if his curiosity tempt him. He will find in Mr. Mill's book the powerful argument for retrospective studies which we Americans, above every other people, need to have forcibly presented to us, and the absence of which from the work of Dr. Youmans is, in our opinion, its only defect.

THE COLLEGE, THE MARKET, AND THE COURT.*

Mrs. Dall's part in the movement for enfranchising women in this country and elsewhere is pretty well known to the public. Her "special work," to use her own language, is that of "collecting and observing facts," and though her commission issues from herself, no one has yet appeared to contest her right or her ability to execute it. A cultivated mind, wide reading, good social position, and the necessary moral courage have made her one of the best advocates of the claims of her sex. Perhaps a little too anxious to verify her own credentials, as she exhorts other women to do, and hence incurring the charge of pedantry or of egotism (a blessed if inglorious gift)—certainly too much given to praising her friends and living public characters, patronizing them, it almost seems, with epithets like "our dear" such-a-one and "saintly" so-and-so—these and other weaknesses she may unconsciously display, but she never lends herself to the arts of the demagogue.

She is unequivocally in favor of bestowing suffrage upon woman (*restoring* it, she would say, in many instances), but the argument elaborated in the three books of this volume does not begin with the ballot-box.

"Mr. Phillips," she says, "plants himself upon the right of suffrage, and *goes back* to secure education and free labor, for state reasons. He has every right to do it; but, on the other hand, *we* may rest upon our un-

* "The College, the Market, and the Court; or, Woman's Relation to Education, Labor, and Law. By Caroline H. Dall." Boston: Lee & Shepard. 1867. Pp. xxxv., 499.

doubted right to education, and go *forward*, with safe, strong steps, to claim the right of suffrage."

And, in another place:

"Education must, in time, earn independence for most women. Independence, taxed and made a citizen of, will insist, in the course of years, upon its suffrage; but whoso will help to reverse the process, and grant suffrage, so that woman may herself indicate what education she wishes to receive, and what labor she wishes to perform, will speed the process by scores of years."

In fact, there is no escape from Mary Wollstonecraft's alternative, "that women should either be shut up, like Eastern princesses, or educated in such a manner as to think and act for themselves." And if any one answers Mr. Higginson's question—"Ought women to learn the alphabet?"—in the affirmative, he must show why they must regulate their education with respect to their husbands, and not to their immortal selves, in whom the same faculties and a like understanding point to the same perfectibility as the law of their being, and the same responsibility for the use of their talents. Mrs. Dall is entirely right in affirming "that the duty woman owes the state is a *moral* duty," and so is that she owes to society and to herself in asserting an equality of rights and privileges. With her usual good sense the author meets the common objection "that there is no such thing as any abstract right to vote."

"We reply," she says, "that in this particular discussion we don't care about *abstract rights*—what we want is our *own share* of the tangible acknowledged right which human governments confer. If, in England, this right depends on a property qualification, then we claim that there the property qualification shall endow woman as well as man with the right of suffrage. If, in America, it depends upon an alienable right to life, liberty, and the pursuit of happiness, then we demand that our Government recognize woman as so endowed, and receive her vote."

Mrs. Dall has used the threefold division of her subject for a more convenient grouping of the facts which go to prove that women have already achieved much, in a great variety of occupations, which affords presumptive evidence of their ability to compete with men in almost every department when once the fetters of custom, tradition, and statute are removed. It is unnecessary for us, therefore, either to report these in detail or to examine the logic of the reasoning which they are made to illustrate. We will only say that the reader must be struck with the scope of the facts here gathered, and favorably impressed by the author's industry and extent of knowledge. Further, she declares that the best brains make the best housekeepers, is at pains to cite remarkable examples of this truth, and would have men equally with women learn and practise the use of the needle. In her strictures on the classics for what they have contributed to the proverbial depreciation of women, and for the impurity which they shelter for those who consult them, we recognize much that is just, and it is all suggestive. Suggestive, indeed, is the most comprehensive praise we can render to the book as a whole, and we would that the daughters and wives of the wealthy would improve the opportunities for usefulness which she so forcibly points out. Let not "the young girls in Beacon Street" shrink from having "something to do" because Mrs. Dall addresses them somewhat like a dressmaker who turns over her cut-out patterns to her apprentices, saying:

"I offer them the establishment of a Training School for Servants, of a public but self-supporting Laundry, of a Ready-made Clothes-room, and a Knitting Factory; all simple matters, entirely within their control, if they would but believe it."

Where much information has to be taken at second-hand, perfect accuracy is not to be expected. To begin with a trifle, Mrs. Dall errs in saying of Madame de Krudener (p. 447) that "she spoke only in French" when she preached, whereas it should read that she could not speak Russian although a native, and hence could not affect the masses by her doctrines. As the wife of a diplomatist at Venice and at Copenhagen, it is probable she was conversant with both Italian and Danish; and her last preaching while in the Crimea was partly in German. The late Dr. Beecher (to take a long skip) is put, we regret to say, in too favorable a light in narrating the Lane Seminary controversy. His quoted words to the future founders of Oberlin are: "You are right; but we are too weak to hold Lane Seminary on anti-slavery principles. Go and make it possible for us." His real words (in private) are reported to have been, and probably correctly: "Go on, boys, and roll the car up to the top of the hill, and then I'll get on, and shout as loud as any of you."

It is no harm that two of the three books of this handsome volume have appeared singly before. The appendix, of which the facts are brought down to the day of publication, is replete with instruction and interest, and we may specify among its contents the descriptions of the chief colleges for women or for men and women, of which Oberlin was the pioneer. We congratulate the author, the publishers, and the printer of this work, and wish it a profitable circulation, in all senses of the word.

THE NORTH AMERICAN REVIEW FOR JULY.

The July *North American* is predominantly literary; Mr. Lowell treats of Rousseau, Mr. Norton of Longfellow's Dante, and Professor Whitney has a long article on the subject upon which he is an authority. Of the nine articles in this number only three are on politico-social subjects—"The Labor Crisis," "Serfdom and Emancipation Laws in Russia," and "The Judiciary of New York."

We do not know how the minds of members of the State Convention are constituted, and about getting from that body any rescue from the municipal tyranny under which this city is suffering we are not very sanguine, but we indulge a hope that so far as concerns a purification of the judiciary the writer of the article last named has told enough. There is no doubt that the facts made known in his thorough exposure are to some extent disgraceful not only to the city, but to the State, and even to the nation; and although obvious reasons forbade it, we wish it had been possible for the writer to pillory our judicial robbers and ruffians by giving the world their names. As to the truth of the facts set down in the article, the whole bar of New York city are witnesses that only a small part of the half has yet been told. In "Serfdom and Emancipation Laws in Russia" Mr. W. C. Gannett has gathered up a useful mass of information in regard to the great measure that has signalized the reign of Alexander Second. Of the practical working of emancipation he is hardly able to tell us anything as yet, and of the practical working of the system of serfdom he tells us little—a people that has just freed four millions of its own slaves is not, perhaps, in need of much information on that head—but after a brief survey of the history of Russian slavery, he puts into an intelligible form the official story of its destruction, and an account of the system that has been substituted for it. This latter would be of general interest, but it is too long for quotation and to condense it would be hard. Mr. Gannett sums up the matter as follows:

"Even the superstructure is not so much to be rebuilt as to be converted to new uses. The peasants are freed, and their future life and prosperity ensured by a single act. The government simply steps between the owner and the owned, and says to the one: 'Remain as you are; your serf represented to you the yearly value of his obrok or service, minus the value of the land he used for his support. He shall still represent to you nearly the same worth. But you must resign two things—first, your control of his person; second, your control of that land which he actually needs.' It turns to the serf and says: 'Remain where you are. You have now no master but the law. Keep your land also; none shall take it from you. But you must pay a rent to the old landlord, about as much money or labor as you formerly gave him. Should you prefer, however, you may buy your house whenever you like; and your lot also, as soon as the 'Baron' is willing. If without money, the government will help you; in this case you will be tenants of the crown, and your children will, in the course of time, become full proprietors.'"

Our own simpler plan of giving the newly-freed slave a vote and letting him acquire his own land is, like the Russian system, in its infancy. Mr. Gannett is somewhat familiar with the old and the new peculiar institutions of both countries, and we hope that five years from now he may be able in another article to give favorable accounts of both.

The first article in the review is on the various theories of "The Origin of the Italian Language," the writer arguing for the opinion of Cesare Cantù, "that Italian is only the naturally modified speech of ancient Latium, so that the law of continuity, established by Leibnitz in physics, has been verified in that language; that no solution of continuity was produced by sudden revolutions, but that successive evolutions reduced the spoken Latin to the modern dialect—evolutions conformable to the usual methods by which the human speech creates, wears out, transforms speech, and therefore similar to the organic processes of other languages." This theory excludes that one which makes the Italian simply the Latin barbarized, changed lexically and grammatically by the speech of the northern invaders of Italy; and it excludes that other one, that the present language of the peninsula is the Latin transformed by the indigenous dialects of the provinces into which it was carried by conquest. The writer's style is not captivating, but his presentation of Cantù's reasoning is, on the whole, well done, and his own additions to Cantù's proofs seem to be of value and to show acuteness. To speak of a small matter, we think him mistaken in citing the use by the English of Pennsylvania of the compound *through-other* as an example of the influence on their speech of the speech of their

German neighbors. But we have no better reason for thinking so than that we have heard the word in question commonly used by English people who had never seen Pennsylvania, perhaps never heard of it, and had probably never been in communication with people who knew that State. It is common in the British provinces and in the north of England and Ireland.

Mr. Henry James's "Ontology of Swedenborg" gives us once again the leading idea of Mr. James's "Substance and Shadow," an idea of Swedenborg's in which, if we understand it, the life of the creature is, as some have said, represented as a piece of loving *finesse* on God's part. It is a pity, we think, that the rush of Mr. James's style holds the reader, unless he struggles hard, a little above the sense. Vivid, eloquent, and energetic as it is, it seems like an unfortunate style for a metaphysician—even for a preacher of metaphysics not a fortunate style.

Professor Whitney, after a glance at the scheme of genetic classification of languages so far as comparative philologists have established it, proceeds to enquire whether linguistic science can ever assert the non-existence of an historical tie through all human language and therefore can prove that Adam and Eve could not have been the first parents of all the living? For such a purpose linguistic science is perfectly useless, Professor Whitney thinks, and, giving his reasons at some length, he reaches a general conclusion which he regards as incontrovertibly established; it is this:

"If the tribes of men are of different parentage, their languages could not be expected to be more unlike than they in fact are; while, on the other hand, if all mankind are of one blood, their tongues need not be more alike than we find them to be."

There is occasionally in Professor Whitney's writing a quiet, apparently unintended, sarcastic stroke that is not at all an unpleasant thing amid the comparative philology. For example, he remarks on the false analogies between discordant languages which some etymologists have thought they had discovered—"seeming indications of relationship which a little historical knowledge, when it is to be had, at once shows to be delusive."

Mr. Norton in his review of Mr. Longfellow's "Translation of the Divine Comedy" begins with some remarks on the opposing schools of translation, giving his voice for that which he prefers to call the realistic rather than, as it is oftenest called, the literal. Mr. Matthew Arnold's direction to the translator—that he should aim to reproduce on the intelligent scholar the general effect of the work he is translating—Mr. Norton finds fault with as a rule too vague. He remarks that the effect of a great poem depends in great measure on qualities which the translator cannot transfer. It can no more be transferred from one language to another, this effect, than the effect of a great picture can be produced by the best engraving. And it is to be remembered that a poem is not simply an abstract production of a pure poetic spirit, but it marks a stage in human progress, it has historic relations, its character is not less historic than poetic, its deepest interest pertains to it not as an isolated effort of human genius. We desire, then, to have the great works of other ages exactly as they are; the realistic method of translation far better than the literal method gratifies this desire, though it is true that it produces not so popular poems, each age as represented by the mass of readers having a natural fondness for the things of its own. Mr. Norton then compares Mr. Longfellow's with Mr. Rossetti's version, which till Mr. Longfellow's appeared was the best translation made on the realistic theory, and therefore the best of all previous translations. Mr. Norton very easily makes out a case in favor of Mr. Longfellow. Then we have given us some noble specimens of the great poem in its English dress, specimens without one of the not uncommon small deformities.

Mr. Lowell's article on "Rousseau and the Sentimentalists" is an exceedingly brilliant one, and, considered as a study of the sentimental character, it seems to us profoundly true. But as a presentation of the character of the man Rousseau, we think it not exhaustive. The reader, of course, wishes the article twice as long, but he feels it not wholly in his own interest, but in Rousseau's as well. Rousseau was a sentimentalist, and carried sentimentalism to insanity; but not only before Europe, but alone with himself, he was more than a sentimentalist. All of which, of course, Mr. Lowell admits; indeed, we do not know where to find more just or kind things said of Rousseau than are said here; but still this essay, in order to take rank with the "Lessing" and "Thoreau," will, we think, have to be filled fuller with the subject of it.

The "Critical Notices" are of course good, but certainly not too light. Master Swinburne gets a very neat feruling, however; and at the end of the reviews Professor Greene pays his attentions to Mr. Bancroft in a way that makes Swinburne's correction seem a succession of soft love-pats.

THE AMERICAN LAW REVIEW.

We are glad to see evidence of the prosperity of this valuable review, which is decidedly the best periodical now or for some years past published for the benefit of the legal profession. We have spoken in commendatory terms of each successive issue, and take pleasure in saying that the July number bears marks of faithful labor on the part of the editors, and of care and taste on the part of the printers.

But this number being the last of the volume, it is an appropriate time to make some criticisms not altogether laudatory, but animated by a sincere interest in the permanent success of the enterprise, and which we have forborne to make while there was danger of hindering that success.

It certainly seems to us that the leading articles of *The Review* are not its strong point, and that they are not improving in quality. There have been nineteen of these articles, of which only nine have been upon what a lawyer calls *practical* subjects; and of these nine only one (the article on "Delivery," April, 1867) is useful to a majority of the bar, while that one is not very well written. Now, we are far from thinking that all articles should be strictly practical, or from expecting that all can be well written. The discussion of abstract questions and of propositions for reform is an important part of the sphere of a legal magazine. But one article out of nineteen is clearly too small a proportion for information of immediate practical value. Again, no single article, if we remember rightly, has been exhaustive of its subject, or could be depended upon as reviewing all the cases, or presenting a complete view of the matter in hand. Such a merit we should not expect of all or most of the articles, but we have a right to look for it in some. Indeed for practical business use an incomplete article is almost worse than worthless, since it invites a reliance which it will not justify. A law-book may be incomplete in respect of the number of subjects treated, yet complete in its treatment of every subject actually discussed, and therefore valuable though faulty. But a mere article, being necessarily confined to a minute subdivision of the law, has especial need of absolute completeness after its kind.

The digest of State reports is prepared, as it seems to us, on a defective principle. It is confessedly a *selection* of cases. On what theory shall the selection be made? We should say, most certainly, if *all* the cases cannot be given, that the selection should be one of subjects and not of cases; that every decision under a given head should be cited whether it seemed interesting or not. The matter for publication may easily be narrowed by selecting points on a few leading subjects only, such as bills, carrier, trust, negligence, partnership, and the like, if space cannot be afforded for all.

The July number opens with an article upon the liability of ship-owners, upon which much pains has been bestowed; but the subject is one in which only a few lawyers are interested. The right of a bankrupt to continue suits commenced by him before his bankruptcy constitutes the subject of the next article, though it purports to review a broader field. The article on "Seals" is confessedly a mere patchwork, entertaining but not thorough. The article on "Government Claims," though not practical, is interesting, and contains some instructive information. The miscellaneous part of *The Review*—the digests, book notices, and summary of events—are good and useful. We are pleased to notice the freedom and candor of the book notices.

The article on "Modern Reform in Pleading" deserves a special notice. It is short, shallow, and supercilious; written by some one who knows little or nothing of his subject, and whose veneration for the Middle Ages has blinded him to the facts of his own time. The article is intended as an attack upon the system of pleading introduced by the New York Code of Procedure. That system as it actually exists is undoubtedly defective, simply because there have always been enough lawyers opposed to it upon the bench and in the Legislature, to misconstrue it in the former place, and to defeat all efforts for its correction in the other. For six years the original framer of the Code has vainly striven to secure legislative sanction for a set of forms as models for pleading, which represent exactly what the Code contemplates. But the perfection of the system is precisely what the old lawyers do not want and will not have. Nevertheless, in spite of all obstacles, the general system of pleading actually in existence in this State leads to more definite issues than that of any State retaining the common-law practice—if indeed there is any State which retains that practice in its palmy state of technicalities. In England and Ireland it has long been thrown overboard, and a system of pleading adopted both at law and in equity in almost exact conformity to the spirit of the New York Code, and, being administered by able men in good faith, the English system is more in accordance with the real law of New York than the system actually in existence here. The article vamps a quotation from Judge Gould which we have seen a good many times, showing that the

Code has actually confused the distinguished jurists of Texas and Arkansas, regions where, as we all know, the height of human wisdom has always been found upon the bench, and no confusion was ever known before the days of the Code. The authority of Judge Gould upon questions involving confusion of ideas will not be doubted by any one who is familiar with his writings. But we advise the editors of *The Law Review*, if they really mean to commence war upon the reforms which have swept the old practice into oblivion both in America and in England, to have the aid of some one who knows the facts of the case, who can avoid egregious blunders, and can bring a little logic and common sense to bear upon the subject. The only difficulty we apprehend in the way of their doing so is that no such person can be found who, if honest and candid, will maintain the vital proposition of the article to which we have thus referred.

We believe that *The Law Review* will speedily outgrow the defects and errors upon which we have commented, and hope to be able in our next notice to give it our unqualified commendation.

Die Insel Creta unter der ottomanischen Verwaltung. Von "Elpis Melena." (Vienna. 1867. New York: L. W. Schmidt.)—The author of this pamphlet is a distinguished literary lady of Germany, who, under the above assumed name, has already published several pamphlets on Greece. She now undertakes to narrate the origin and causes of the present rising of the Cretes against the Ottoman oppression. The population of Crete she numbers at about 300,000, of which 220,000 belong to the orthodox Greek Catholic Church, and the rest to Islam. The prime cause of the revolution consists in the *mekheme*, the only tribunal recognized by the Ottoman law in civil and religious matters. It is presided over by the cadis and the mollah, and applies the rules of the Koran to all cases submitted to it. This had lately been wielded by Mustapha Pasha with a pressure unheard of before. The mollah, the president of the cadis, is guardian and administrator of all minors, judge in all questions of inheritance, the only notary public through whom the Christians can execute valid bills of sale, deeds, bonds, and contracts. He receives five per cent. of the value of everything submitted to his decision or his signature. As the Mohammedan law imposes the cost of lawsuits on the defendant when he wins, he is exposed to endless chicanery and expenses, for his adversary may, if he choose, again bring the same charge against him, the mollah pocketing for the second time five per cent. and so on, besides which he makes the most extortionate charges, such as *tetalie* (summons fee), *calemie* (entrance money), *resm* (entertaining fee), and a number of others. The mollah and his subordinates, by a loose interpretation of the Koran, have the law entirely in their own hands, and are especially corrupt in the exercise of their power in cases of inheritance.

The second of the many causes which forced the Cretans to take up arms was the practice of farming out the taxes of the island. When Crete passed, in 1841, from the possession of the Viceroy of Egypt into that of the Porte, the tithe was reduced from one-seventh to one-tenth. But it was not long before a change for the worse took place. Mustapha Pasha leased from the Porte the collection of taxes—customs duties not excepted—and then in turn farmed out the collection to the highest bidders, making them all necessary concessions to facilitate their fulfilling their obligations towards him. Before the farmer could remove the harvest from his field, he was obliged first to hand over to the tax-collector the portion due the latter, who then kept him waiting, in order to screw out, as the price of his permission to let the harvest be taken away, a much larger assessment than really was due. Or, the farmers being legally compelled to convey the tithe a distance of three or four days' journey, if required, the collectors demanded an extra charge in all cases where they did not demand the transport of the tithe. Where the harvest could not be collected at one time—as with olives—the tax-collector fixed the average amount of the harvest and the proportion which the farmer had to pay, in which cases it often happened that the farmer was hardly able, after having sold the proceeds of his fields, to pay even the tithe fixed by the collector. Besides this oppressive tax there exists a military tax, levied upon all persons, even widows and orphans, the amount being fixed according to the pleasure of the collectors.

These were some of the principal abuses, the abolition of which—in a petition of thirty delegates, elected by the people of Crete, in April, 1866—was asked from the Porte. The answer was a threat that if the delegates did not at once disperse and retire to their homes they would be compelled by force of arms. The representatives of Crete then, on July 20, 1866, addressed a manifesto to the foreign consuls, and began hostilities, the result of which is still undecided. Under a liberal government, the undeveloped resources of the island would undoubtedly present a widely different aspect from what they do at present. The exports of produce in 1858, the date of the latest information which could be obtained, amounted to 15,373,000 francs. The imports in 1858 consisted of corn, cloth, dry-goods, fancy goods, iron, tobacco, hardware, and other manufactures, and were chiefly from Turkey (9,995,000 francs), Greece (5,132,000), Austria (1,505,000), France (200,000), England (193,000), Naples (110,000). With the exception of a few foreign and Greek merchants, the whole Cretan industry and commerce is in the hands of Mussulmans, the agriculture in those of Christians.

England im Reformationszeitalter. Vier Vorträge von Wilhelm Maurenbrecher. (Düsseldorf: Julius Buddeus. 1866.)—The sixteenth century is to Englishmen and Americans of our day one of the most interesting and most instructive periods of all history. Between the year 1509, in which Henry VIII. ascended the throne, and the year 1603, in which Elizabeth died, the foundations of the English church and state were laid. The Great Britain of to-day is both politically and ecclesiastically the work of the Tudor dynasty. It is this formative epoch which Herr Maurenbrecher treats in a series of four lectures, originally delivered in the university-city of Bonn, and afterwards revised and published with annotations, in which he briefly indicates his authorities wherever he deviates from current opinions or touches upon controversial questions. The author has evidently made a thorough study of original sources and contemporary documents, and carries into all his investigations the true spirit of historical criticism. His book is not merely compiled and condensed from more voluminous chronicles, but rests upon a wholly independent basis of research. In his lecture on Henry VIII., he sets forth in a very clear light the connection between that monarch's matrimonial vicissitudes and the changes in Wolsey's European policy. The Spanish marriage had been the result and expression of the Spanish alliance. The famous words of Louis XIV., *L'état, c'est moi*, were at that time the utterance of a literal fact. The monarch was the whole state, and consequently his personal and domestic affairs assumed an immense political importance. It is a serious defect of Froude's "History of England" that he does not make this relation sufficiently prominent. Had he done so he might have shown the necessity of the divorce without constantly panegyrizing the monarch and defaming the successive victims of his passions. Herr Maurenbrecher proves conclusively that the dissolution of the Spanish marriage was, under the circumstances, the inevitable consequences of the dissolution of the Spanish alliance of which Catharine had always been regarded as the representative. The issue of the battle of Pavia had greatly disturbed the balance of power in Europe. To restore the equilibrium Wolsey formed a league with France; but it was essential to the complete success of this new foreign policy that the aunt of Charles V. should cease to be queen of England. Froude's statement that the divorce presented itself to Henry VIII. "as a moral obligation" has no basis of fact to rest upon. It was simply a part of Wolsey's political programme. With the same objective clearness and freedom from prejudice Herr Maurenbrecher discusses the chief moments of the reigns of Edward VI., Mary Tudor, Elizabeth, and the unfortunate Queen of Scots. His narrative of events is concise and vivid, and the characters of Wolsey, Cromwell, Cranmer, Somerset, and Burleigh are sketched with great vigor and keen discrimination. Of the relations of Mary Stuart with Bothwell, and that wonderful whirl of criminal passion in which all thoughts of state and church and duty and shame were swallowed up, the author gives us a brief but impressive picture. We hope that some competent person will find leisure to translate this work and thus render it accessible to the English-reading public. The era of which it treats is one of intense interest. The political and religious parties of the sixteenth century still exist and hold towards each other the same hostile attitude. It is for this reason that it has been so difficult to write their history with due impartiality.

The Code as it Is. 1867. Edited by John Townshend. (New York: Baker, Voorhis & Co.)—This is a carefully revised edition of the Code of Procedure of New York, and of the rules of the various courts of record, embodying all the amendments down to the present time. It has also a very full index. The value of this pocket companion is too well known to the profession to need our commendation; but it gives us pleasure to notice the faithfulness with which each successive edition is prepared. The difference between this book and that published by Diossy & Cockcroft—a genuine pocket edition of the Code, small enough to carry in the narrowest and shallowest pocket—is that this includes the rules, retains the division of the Code into chapters, etc., and has an index; but there is of course a corresponding difference in price. The typographical execution of this edition is not equal to the other, nor quite what we expect from such usually excellent printers.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

THE REPUBLICAN PARTY IN THE SOUTH.

Registration under military control has added one more to the hundred proofs of the utter failure of "Conservative" prophecies concerning the freedmen of the South. Notwithstanding all demonstrations to the contrary—in spite of the clearest evidence that science could draw from shins, hair, and cuticle, or wisdom draw from long experience, whip in hand, on cotton plantations—it is now admitted that the negro can fight, will work, and is both capable of receiving education and eager for it. Almost the only predictions of "those who knew the negro best" which have not long since been so thoroughly overthrown by facts as to be ridiculous, are the assertions (1) that the mass of the freedmen care nothing about the right of suffrage, and (2) that in exercising that right they will be entirely controlled by their old masters. The war of races, which Mr. Johnson dwelt upon with so much emphasis as certain to result from the admission of negroes to vote, has long been a public jest. Wade Hampton made it absurd in a single day.

There were certainly plausible grounds for believing that the freedmen would be indifferent to the right of suffrage. Never having had the privilege, and having been trained from time immemorial to seek for happiness only in sensual indulgences to which such a franchise could not contribute, it did not seem unlikely, from that point of view, that they would be indifferent to it. But, on the other hand, those who believed in the natural capacity of the colored race for improvement insisted that they had learned or would rapidly learn the value of political rights, and would not fail to exercise them. The result of the registration thus far in every Southern State has justified the latter view. In every State and, as far as we know, in every county, no matter how secluded from Northern influences, a far larger proportion of the resident colored voters have registered than of whites. In Virginia the colored electors are in a large majority on the roll, although the whites, if all registered, would outnumber them by nearly 40,000. In Louisiana, where the numbers of the two races are nearly equal, the colored voters on the register number twice as many as the white. The case is much the same in Georgia, Alabama, and, indeed, everywhere. The freedmen have, in every place where they have been properly protected from intimidation, manifested an eagerness to be enrolled for which there is no precedent among white people North or South.

The only prediction that remains to be disproved is, that the freedmen will vote under the dictation of their former masters. It is abundantly proved that this will not be the case in large cities, and the registration of such vast numbers of the plantation negroes, contrary to the well-known wishes of their masters, affords strong evidence that they too will vote independently of local influences. Indeed, no reasonable man who has watched the course of affairs in the South can doubt that almost the entire body of the newly enfranchised race desire to cast their votes for men who are heartily in sympathy with the party and the policy which secured their freedom. The only real danger lies in the want of organization and information among the colored people, which leaves them open to imposition alike from secret enemies and from indiscreet and over-zealous friends.

A serious duty is thus devolved upon the Republicans of the North. They have the best organization ever known in the political history of this country, abundant wealth, and every facility for conducting political campaigns. They have now an opportunity to extend the same organization over the entire Union, and thus to secure the perpetuity of the nation even more effectually than has been done by war. They cannot with any wisdom or safety leave their Southern allies to carry on the work alone. Where all are inexperienced, the most presumptuous, and therefore the most unfit, are likely to rush to the helm, and guide a movement with which they ardently sympathize, but the perils of which they do not comprehend. There will be distracting quarrels for leadership, in which the power of the majority may be lost. Demagogues will raise false issues by the use of enticing programmes which can never be carried out. The large number of Southern white men who are now coming into the Republican party may be driven off by the jealousy of petty leaders anxious for office, and parties be thus divided strictly upon color—a result greatly to be deprecated, and which may, by a little prudence, be entirely avoided.

We do not wish that the course of Southern politics should be absolutely dictated by Northern men; but it is well known that judicious Northerners have the confidence of all in the South who are disposed to act with the Republican party, and can reconcile conflicting interests more completely than any Southern man can do. A striking example of this has recently been given in Virginia, where the presence of a few gentlemen from the North resulted in healing a bitter feud in the party, and in starting a movement which is now spreading over the whole State, promising to bring within the Republican ranks almost every man who was sincerely for the Union before the late war.

The aid which the North can and ought to give will consist in giving money to defray necessary political expenses, in sending out public speakers, who should be men able to interest large audiences, and of moderate language, free from passion and revengeful feelings, in supplying sound advisers who can harmonize internal difficulties and suggest plans of organization, and in distributing political tracts or papers, which should be simple enough for children to read to their parents, short, plain, and to the point. Congressional speeches are not of much value for this purpose. They are calculated for Northern latitudes. Their tone is not often likely to attract Southern whites, and they are not simple enough for the colored people, who depend almost entirely upon their children for reading matter.

We are glad to see that Massachusetts has taken hold of this duty in earnest, and that an association has been organized under the presidency of Mr. George C. Richardson for this purpose. The names of the officers are all good, but we notice with special pleasure the names of Messrs. Andrew, Atkinson, Dana, and Loring, whose abilities and discretion assure us that the work will be conducted under the best auspices. We need not urge such men to see to it that nothing is done to excite the freedmen to feelings of revenge or with delusive hopes of direct benefits from Government; while we are equally confident that they will seek to arouse the allies of the Republican party over all the South to a sense of the importance of the coming elections, and to give them an organization which will bring out their full strength and attract additions to their number. Similar associations might well be formed in every large State, or, which would perhaps be better, the Massachusetts association might nationalize itself, and give to all who co-operate in the movement the benefit of the wisdom and efficiency which we are persuaded will characterize the parent society.

TRUE RADICALISM.

Many well-meaning persons, impressed with a sense of the value of past reforms, and disgusted with the stupid conservatism which blindly adheres to every ancient abuse, are so anxious to be considered "radical" in their views that they fear to stop even when they have attained all that is really desirable or practicable. They distrust themselves if their common sense tells them to pause, and feel uneasy at the thought that they have no more fields to conquer, and no progress, as it seems to them, to make. They dread the imputation of conservatism, and would almost prefer to have risked what they have gained rather than stand still. This class is never likely to form the majority of a community, but as its errors frequently afford an excuse for a reaction against wise reforms, it may be well to address a few words of advice to those who feel troubled by such fears.

The first thought that occurs to us is the folly of imagining that, for hundreds of years to come, there will be any difficulty in finding subjects for radical reform. As fast as one topic of discussion is disposed of a dozen are ready to rise in its place—all important, involving

much labor, needing long consideration, and sure to lead to animated controversy. It is a law of human nature that only one such controversy can be carried on at one time and place. Slavery, and the evils growing out of it, have absorbed the attention of this country for some years past, and so gigantic an abomination could never have been overthrown without an intense concentration of the public mind upon the work. It has been cut up by the roots, and the Congressional plan of reconstruction is rapidly extracting the last remnant from the ground. Universal suffrage is so nearly established, and appears so certain, that some who are more anxious to be radical than to be right are already casting about for some new demand for the benefit of those who were lately oppressed. But who cannot see that there are many other great questions which have been lying in abeyance during this great struggle, and which will give ample scope to the powers of the most radical reformer? Let no man be impatient for conflict. He will soon have quite enough in the legitimate path of duty. With a system of taxation which demoralizes a large part of the community, with rotten legislatures, municipalities, and judges, with systems of education grossly defective, with extravagance and inefficiency the rule in government rather than the exception, it is clear that no one need fear that the work of reform is at an end.

In the next place, genuine radicalism aims only to uproot evil, and to plant in its place that which promises good fruit. Having done this thoroughly, the wise radical is content to wait for final results, and slowly to build up when the work of pulling down is properly over. If we can never reach a state in which growth rather than destruction is desirable, then all destruction is useless, and the radical is the most unwise of men. But such is not the fact. We have already, in respect of many things, reached the stage in which development, and not simple uprooting, is the duty of the race. The Christian religion, the education of the young, the republican system of government, the family state, the liberty of commerce, and many other instances, might be given as illustrations of institutions or doctrines which need no change at the root, but have yet vast room for development and progress.

The practical application of these remarks at the present time relates chiefly to those persons who are uneasy lest by opposing confiscation and other punitory schemes they should cease to be radical. The party which claims to be conservative is so amazingly stupid that we cannot blame any one for doubting his own sagacity when he finds himself agreeing with it upon any point. But it should be borne in mind that, like a man who sings on one note the whole time, a party that persists in one line of conduct must be right occasionally and may happen to be right frequently. Let no one fear to act upon his own convictions of duty even if he does find himself sometimes in strange company.

All the propositions which are made by demagogues, looking toward special favors for special classes of people, are simply schemes of robbery which will, if carried out, despoil the majority of the very classes intended to be favored. Suppose the land of the South should be confiscated and divided among the negroes, as some advise. Not one-fourth of the negroes would get any land which they could live upon, while the other three-fourths would be deprived of a large part of their wages by the universal disorganization of the employing class. Suppose the eight-hour law should be made compulsory, as its friends insist. Who would suffer so much as the workmen, whose wages would be cut down and whose employers would largely abandon enterprises undertaken under different expectations?

It is not the mission of true radicalism to enter upon such schemes as these. In the sphere of politics it has long been the maxim of radicals that nothing can or should be done except to secure to every man the free use of his powers and a fair and equal opportunity for his development. In other spheres of action there is abundance of work for the most zealous reformer. Nay, in political affairs, as we have already intimated, there will always be enough to do. While the nation has been crushing one evil, others have sprung up which in their turn demand attention. Let us be content with securing equal justice at the South, and then combine to attack corruptions nearer home.

THE MEXICAN MORAL.

Whatever may be thought of the morality of Louis Napoleon's performances in Mexico during the last four or five years—and no one can think worse of it than we do—it is safe to say that nothing has ever happened, or will happen, to render more service to the reputation of Juarez and the Liberals than the French invasion. The constitution which the intruders upset was just three years old, and had managed to survive one revolution and one sub-revolution—if we may apply that term to a convulsion in the ranks of one of the two great parties. Juarez had got comfortably into his place, and he promised to do great things. He was about to try to introduce order into the public finances, and he was to oppose resolutely the Church party, of course; but there was really no reason to believe that he would have succeeded any better than any of his predecessors in doing for Mexico the one thing (as yet) needful—supplying her with a regular government, a tolerable administration of justice. He was compelled to acknowledge in his negotiations with the French that the great difficulty of his position was that the provinces refused obedience to the orders issued from the capital, and that he was consequently unable to collect the revenue; which is very like a paralytic assuring his friends that he would be in the enjoyment of perfect health if he only had the use of his limbs. In fact, the only reason which his friends in this country have ever offered for the belief that Mexico would have been any better off under his Government than under that of those who had gone before him, was that his intentions were good and that his opponents were worse men than he. He had really liberal ideas; was opposed to ecclesiastical domination, wished to secularize the Government, and, if he could have got the country to submit to him, would doubtless have met the public obligations, and have made Mexico somewhat happier and more peaceful than she had ever been before. But whether he had the capacity to carry out his good intentions was what remained to be proved in order to raise him any higher in the estimation of the world than the scores of pretenders and revolutionists with whom he had had to contend in the political arena; and this, happily for him, as we think, the arrival of the French relieved him for the time being of the necessity of proving.

How little real strength his Government had was proved by the feebleness of his resistance. It managed to hold a paltry French force in check for a short period at Puebla, but as soon as Puebla fell the contest was over. The capital fell, too, and the empire was set up. Juarez fled, and had to be hid in obscure villages, with a price on his head, and the operations of the national defenders during the remainder of Maximilian's career consisted of robbery and murder, which were dignified with the name of "guerilla warfare." Now, when a moderately orderly, industrious, and law-loving people, such as the Tyrolese of Hofer's day, or even the Spaniards of Palafox's day, take to guerilla warfare as a means of driving out or even wreaking vengeance on a foreign invader, one feels satisfied that the patriotic sentiment is strong in their hearts, that unless they loved liberty and independence dearly they would never engage in an employment so repulsive in itself to good citizens. But when we hear of Mexicans carrying on guerilla operations we cannot draw any such inference. When French baggage-guards and couriers and travellers had their throats cut and their purses taken on the highway during the days of the empire, they simply met with a fate to which in the most peaceable times everybody, no matter what his public or private virtues, has been for many a year exposed in Mexico whenever he ventured out of the great towns. Brigandage on a great scale has prevailed in the country ever since the war of independence. It is one of the ordinary sequelæ of protracted wars carried on by badly organized and undisciplined armies; and the phenomena which after the fall of Puebla were made to appear to the outside world as the heroic efforts of Mexican patriots to shake off a foreign yoke, were simply the ordinary symptoms of the national disease, aggravated by the presence of foreign armies.

It is quite true that during the whole period of Maximilian's reign there were many districts in which his authority was never acknowledged, and others in which it was acknowledged only as long as his troops were present to support it; but all Mexican rulers, no matter how legitimate the origin of their government, have had, since the

expulsion of the Spaniards, the same story to tell; even Juarez had it to tell, before Maximilian arrived. So that it may fairly be asserted that there was nothing in the character of the resistance which the Liberals made to the invaders to show that they were possessed of either much influence with the people or of the capacity to use it, if they had possessed it. No doubt there was a somewhat deeper feeling excited against the French than any native faction ever has to contend with, and doubtless towards the close Maximilian, as a foreigner, met with less sympathy, had a smaller following than most native chiefs have been able to boast; but in being generally abandoned, overpowered, and finally shot, he simply ended his course as prominent politicians in Mexico are apt to end theirs. There is, therefore, for us, we honestly confess, nothing especially impressive or valuable in the lesson of his story. It will, we fear, teach princes and invaders nothing, except that Mexico is a disgusting country peopled by ruffians, into which a Christian and a gentleman is a fool for venturing. Maximilian's reputation in Europe at this moment is probably about as much affected by what has happened as that of Speke or Grant would have been if, after having put themselves at the head of a faction in an African tribe and attempted to civilize it, they had been vanquished, slain by the native ruler, and served up cold at a court banquet.

Nor will the triumph of Juarez do much, we fear, to inspirit the defenders of liberty and national independence either in other parts of the world or in coming ages. The resistance of the Mexican patriots was, as we have shown, in a military point of view, paltry and insignificant, and capable of being ascribed to anything but high motives; but even supposing it to have been dictated by genuine love of liberty, the exertions in behalf of liberty and nationality of those who have not shown any capacity to put either the one or the other to any good use have happily never made much impression on mankind. The moral judgment of the race has never been so warped in any civilized age that men were profoundly moved by the spectacle of brigands gallantly resisting foreign armies, lest their brigandage might be stopped, or factions uniting for a brief period against an usurper, so that their game of revolution and counter-revolution might not be disturbed. Juarez owes nearly all the reputation he possesses in the United States at this moment first, of course, to the belief in his good intentions, which prevailed six years ago; to his opposition to the priest party, for which every good American has a traditional hatred; and though last, not least, to the fact that those who overthrew him did so for the avowed object of discrediting republicanism, establishing monarchy on this continent, and checking the spread of American principles and dominion. This, of course, made him in some sense the martyr of our cause and of republicanism, and procured for him the honor of being the object of Victor Hugo's last rhapsody; but a reputation acquired in this way could only have been preserved by the inaction and obscurity of the wearer. The minute he came out from his hiding-place to play once more the statesman's part, it perished. He showed that he had in his retirement learnt nothing and forgotten nothing, and that his great instruments of order and progress were still the rifle, the forced loan, and "domiciliary visits." As might have been expected, too, the only public men in the United States from whom his performances command admiration are politicians of what may be called "the hammer-and-tongs" school, who have little or no faith in ideas as a political force, and to whom gentleness, forbearance, or persuasion are signs of weakness or lukewarmness; or of the other and worse class, who think there is something very noble, grand, and republican in shooting "a prince," when you catch him helpless and defenceless.

The moral of the Mexican imbroglio is—and we predict that it is a moral which the events of the next six years of her history will make clearer and more impressive than the events of the last six—that forms of government or constitutions have in themselves very little value; that the best ever devised may, in the hands of a people too ignorant or too vicious to work it, prove the greatest of curses. There can hardly be a question that had the Mexicans fallen into the hands of an "enlightened despot" when they threw off the Spanish yoke, they would by this time have made considerable progress in civilization and in the acquisition of political ideas. They were, however, so impressed by the example of the United States and so hostile to monarchical traditions, and there was such a complete absence amongst them of persons having pretensions to royalty, that they had little difficulty in setting up what seemed to be a democratic republic. What they did set up was an oligarchy of rascally adventurers, who have been enabled under the cover of republican forms to play for forty years a game of mutual slaughter and plunder, and to play it in a spirit and with results which make the Roman Empire in its worst days seem respectable. During the whole of the revolting farce there has not been the slightest evidence that the mass of the people have the slightest idea of what republican liberty means, or that the political leaders have either the self-restraint, respect for life and property and liberty and law, without which political leaders in a semi-barbarous country are sure to prove a curse. What Mexico wants now is to be civilized, and civilization she cannot have without a reasonable period of tranquillity and security. The long disorders of which she has been the victim have apparently weakened or destroyed most of the bonds which hold society together, and from what quarter the strong hand which can give her peace and repose will be stretched out we confess we cannot guess. That there are amongst the people themselves the elements of revival it is difficult to believe. The nearest approach to public spirit they seem to have made consists in a holy hatred of foreigners; but this virtue, if it be a virtue, unfortunately flourished amongst the Iroquois, and still flourishes amongst the Affghans and the Koords, in a much manlier and more robust form than any form in which the Mexicans have yet displayed it. The lesson which all the world may learn from their story, is that the only sure defences of freedom and independence are the education and intelligence of the individual citizen, and the general respect for family and property and life which results from education, and from education only. The lesson is all the more valuable, too, at this moment, because the doctrine has begun to gain some currency that you have only to take a community of ruffians, no matter how isolated they may be, or how cut off from good influences, and convert them into model citizens by a few turns of the ballot-box. The secret of political success is to be found in the school-house, and nowhere else.

"THE NATION" AND THE RELIGIOUS PRESS.

Religious periodicals, meaning by this periodicals which not only undertake to be the organs of particular denominations of Christians, but to make themselves in an especial manner the defenders of religious truth, are somehow every year losing more and more of their value in the eyes of educated, intelligent, and sincerely religious men; and are every year falling more and more behind what they are pleased to call the "secular" press. This proposition was admitted and commented on with a good deal of elaboration by *The Christian Advocate*, of this city, not very long ago, and anybody who chose to take the trouble might produce plenty of illustrations in support of it. One of the great causes of the decline of the influence of the religious press, both in this country and in England—for it is only here and in England that it flourishes—we take to be the amount of time and space it devotes to the mediæval sport of scenting out heretics and infidels and running them to earth. It seems to consider itself in some sense a militant order, whose special duty to religion is to ferret out and chastise the heterodox. Now, the world is getting tired of seeing the heterodox chastised, as it believes there is much better work for Christians to do, and it has begun to consider mere denunciation of infidels uncommonly poor sport. When *The Christian Advocate*, therefore, was foolish enough some weeks ago to designate "the editorial corps" of The Nation as "polite infidels," we did not deem it necessary to take any notice of it. When a religious newspaper calls persons of whose opinions it knows absolutely nothing "infidels," it simply "calls names," and it would be a waste of time to make any reply. Since then, however, we have noticed mysterious allusions in other papers of the same character, hinting, rather than asserting, the presence in our office of "a disciple of Comte," engaged in the work of reviewing religious books. We let these pass, in the same way, till they appeared in so respectable a journal as *The New Englander* in the form of a positive assertion.

We beg now to say that it would be as near the truth to allege that we had imported a Buddhist and kept him constantly at work writing on questions of natural religion as to allege that we have committed this task to a "disciple of Comte." If charges of this kind only fell into the hands of educated men, who knew who Comte was or what he taught, nothing would induce us to depart from our usual rule by defending ourselves against them. But a very large body of the readers of the journals who

are hardest on Comte and his followers know nothing whatever about him except that he was a "crazy infidel," who set up a rather ridiculous god of his own manufacture, and when their "family paper" tells them that his disciples are writing in a certain journal they naturally expect to find in its pages traces of brimstone.

Although we have mentioned *The New Englander* as one of the periodicals which have been indulging in this unfair style of criticism, we are far from placing it in the same category with those weekly religious papers which throw most of the mud at their "secular" contemporaries and at each other. *It* does make valuable contributions to the thought of the day, on a wide range of subjects, and is characterized by a genuinely Christian spirit. Many of the weeklies, however, though greatly improved and almost weaned from the depraved habit of sectarian controversy of which they were once victims, still discharge their duties as *ex-officio* defenders of religious truth in what we cannot help calling a repulsively perfunctory manner; and this, if *The Christian Advocate* will allow us to say so, is, in our opinion, another cause of the waning of their influence. Their articles read very much like the Pope's allocutions. The sound and the phraseology are technically unexceptionable. It would take a doctor of divinity to detect a flaw in their doctrine, but the substance, the life, the glow of conviction are wanting. One feels on running through their homilies as if they were written rather to furnish a certain number of good people in the country districts with proper Sunday reading than because an earnest and honest man had something to say in them, and could not help saying it, and knew how to say it in simple and manly English. To rouse them into a burst of genuine feeling it seems necessary to parade before them an infidel or heretic or something that looks like one. On catching sight of him all constraint and hollowness vanish from their language. They tear off from him the wretched cloak of philosophy, and reveal the workings of his miserable soul to their shocked and affrighted subscribers with real zeal and enthusiasm.

Yet it seems to us the slaughtering of infidels and Comtists, whether real or supposed, is not the mission of the religious press of to-day. Whether it be possible to find in any community many men capable of regularly once a week taking, in a newspaper, a strictly religious view of the events of the day, and treating them from this point of view with real fervor and real force, may be doubted. But that the business of the religious press is to do this, and not to bring railing accusations against its neighbors, admits of no doubt. That it is only by doing this with eloquence and earnestness that it will ever justify its existence, admits of just as little. At present the world begins to feel dissatisfied with what it offers as its *raison d'être*. Not that people's thirst for true and undefiled religion is in any wise abated, or that they are not to-day more firmly persuaded than they have ever been in any age that without God "nothing is holy, and nothing is strong;" but that they are more determined than ever that those who address them on the weightiest of all themes shall do so in their mother tongue, in the English of the fireside and of the Bible, the English in which we all think and talk when we are deeply moved, and that they shall do it with the air of men who are more occupied with giving vent to the convictions of their souls than of keeping within the technical bounds of denominational orthodoxy, and saying nothing which an Episcopal or Congregational or Presbyterian organ ought not to say. More than this, the world requires of all those who attempt to teach it religion a frank and hearty acknowledgment that the great laws of morality are of universal obligation, that all men are the "neighbors" of the Christian man, and that, therefore, to revile or to impute bad motives even to those whom we suspect of being heathens or publicans, is now, as it was eighteen hundred years ago, something worse than a violation of conventional propriety. Of this truth, we regret to say, the religious press on both sides of the Atlantic has been almost habitually forgetful, and the result is that the spread of moral and intellectual culture, instead of telling in its favor, tells against it.

Of course we can and do make many exceptions in thus criticising these papers. There are many of them which do bear in mind that the denunciatory periods, if we may call them so, of the Church's history have not been those in which grace most abounded. But they have all of them a widely different aim from that of The Nation, and we protest against their judging us by their standard. They seek to provide for their readers a pleasant, trim garden, snugly hedged in, across which the wild winds by which the world of religion, of morals, and of science is shaken shall never blow, in which all the smells shall be perfumes, and all the sights and sounds shall be peaceful and grateful. We, on the contrary, seek to place our readers on the open hillside, in full view of the clanging fights and flaming towns and sinking ships and praying hands of real life. The Nation is written for men and women and not for children; and it is written for Protestants—that is, for persons who have their faith and conscience in their own keeping, and do not need to submit their books and newspapers to a spiritual director before opening them; and one of its objects is to keep them informed of what the best minds are thinking and saying in all fields of thought; and just now the best minds are thinking and saying a great deal that is novel. No writer is either invited to or excluded from its columns because of his religious opinions. What we ask of him is, that he shall be an honest man, understand his subject, and be able to express his thoughts about it. But we do not guarantee that every book review or article on questions of morals or philosophy will stand the criticisms of an assembly of divines, or of editors of religious newspapers. Heresy is a subtle essence, and any secular editor who undertakes that it shall never penetrate his pages is very apt to be pronounced an imbecile for his pains. What The Nation undertakes to be is Christian in tone and temper and aims, and when anybody believes that it fails in these things, we shall be glad to hear from him. The parade of formal professions of religion in the market-place as a mode of attracting custom has not only become repulsive to all good men, but has become worthless as a commercial expedient. So that those who refrain from it not only keep their souls clean, but avoid a waste of labor.

ANOTHER COMIC JOURNAL ENTERPRISE.

Two or three years ago Mr. Taxile Delord, who had been figuring successfully as one of the wits of *Le Charivari*, was writing in *Le Siècle* on a serious matter—something on the nature of liberty, we believe it was—and allowed himself to discuss his subject in a manner which, had he been speaking through *Le Charivari*, would have seemed quite appropriate and pleasant. At once there was a great commotion; his proceedings were highly resented; he was told by the other writers in the dignified journals that *Le Siècle* was not *Le Charivari;* that if, however, it was his determination to employ ridicule and drollery in the discussion of subjects which demanded a thoughtful and earnest style of treatment, he should have enough of it, and *L'Avenir National*, *Le Temps*, and other Parisian newspapers forthwith took a course with him, in controverting and commenting on his arguments, which speedily had the effect of convincing him of the error of his comical ways, and of inducing him to apologize for his misstep. He publicly announced his intention of putting a bridle on his tongue and thenceforth showing his teeth only carnivorously when he had weighty matters in hand, and of conforming himself strictly to the laws of serious journalism.

And whoever is at all familiar with the English press knows how it is given to dignity, and how imposing in deportment is the British editorial staff. In Great Britain, as in France, wit in all its kinds is, of course, not only permitted in journalism, but is eagerly sought after, and the Fonblanques and the Lowes no more lack an appreciative and delighted audience than do the Prévost-Paradols across the Channel. But fun-making and the wildness of humor are no more tolerated in the leading articles of the one country than of the other. Whether or not the same standard is set up in German newspaperdom we can hardly say. We may be sure, anyhow, that the fun of the *Allgemeine Zeitung* is itself a very serious thing, and we have little hesitation in asserting that in practice, at all events, whatever may be the German theory, the German press, like its more powerful neighbors, is even oppressively dignified. So, then, over there on the other side they are provided with regular comic journals which live and flourish, and by their length of days and prosperity put to shame our short-lived and disastrous attempts at American *Punches* and *Charivaris*.

This theory is not original with us. Previous enquirers have already declared that if our nominally serious press were fettered by the rules which obtain in the world of trans-Atlantic journalism, if political, discursive, and party warfare among us were carried on in the lofty fashion which alone is allowed by English and French taste, we also should have room for a good comic paper. And it seems true enough. Imagine, for instance, that all the political writing of the New York *Times* were done by "A Veteran Observer," and there were no "Minor Topics;" that *The Tribune* were to confine itself to the "Men and Brethren" hortatory-denunciatory sort of writing and had no political economists on its list of contributors; that *The World* were to surrender itself wholly to its explications of the Constitution; that *The Evening Post* were to do likewise; that *The Commercial Advertiser* were to discard its "Timely Themes" and turn itself with eye single and undistracted upon "H. G." and the Canada negotiations; that *The Advertiser* of Boston were to go back to the solemn days when the graduates of the class of 1798 of Harvard College read it and wrote it and loved it well, to the days when it would have shuddered at its own present column of things "In General;" imagine that *The Post* of the same city were to remember only the custom-house officers and the postmasters of the good

old time and were to be decent and reputable, with no column of "All Sorts;" and, finally, imagine that the country papers East and West were to follow after these and were all to become like the high-toned press of "Richmond on the James," ignorant of wit, destitute of humor, or with only unconscious humor—then we can very easily imagine the readers of newspapers crowding once a week, or a good deal oftener, to buy our *Vanity Fair*, which, as the case stands now, is dead, or our *Mrs. Grundy*, which also is dead, or some other channel of the wit which at present runs in a thousand streams and makes the existence of a humorous journal of a tolerable kind almost an impossibility.

We have, however, lately heard a piece of news, or rather a rumor, which seems to promise that our reproach shall be taken away. It is said that Mr. Nast and the Rev. Mr. Nasby are going to manage a comic paper. And either these gentlemen or the concocters of the report are wise, for it is said that the paper in question is to be issued not at regular intervals, but now and then. The reputation of these two humorists, and a way they have of upholding it, would make it pretty sure that a paper filled up with their devices would sell in the face of almost any competition, and we suppose the plan of irregular issues to be based on an intention of the managers to issue it when they shall have filled the paper themselves, perhaps only when some exceptionally ludicrous or ridiculous occurrences shall have enabled them to fill it exceptionally. Who knows? Our posterity in the fifth generation may have a first-class humorist paper like *Punch*" which, in honor of the great success of the pioneers, shall have for its name, then become a patronymic, "Nast & Nasby." All this, however, by the way; the report we mention has an air of extremely dubious authenticity.

We have not named among our serious journals which do more or less comic work *The Herald* of this city. It is only in consideration of its advertisements and some of its news that it has any claim to be regarded seriously; it certainly merits its own praise—and only Mr. Punch himself shows more modesty in self-praise—of being *the* comic journal of America. Mr. Parton—whom, perhaps, no joke completely overpowers—did not, as regards this point, do justice to *The Herald* in his well-known account of Mr. Bennett and his paper. But the fact is that *The Herald* in almost its every issue is really extremely funny. The fun is almost always, or at any rate very often it is, of a disgraceful and wicked kind; far more than any other publication in the world—more, at least, than any of which we have any knowledge. *The Herald* has its being in that atmosphere of moral license, or rather lawlessness, in which wit is apt to flourish. Can anybody name a single consideration of the kind called high which to *The Herald* is apparently of any force? Probably nobody. So its wit would oftenest be of the Mephistophelean order were it not that out of regard for the mental weakness of its audience it is frequently obliged to make a mental descent and moral rise to what may be called gross buffoonery, jingling of cap and bells, and thwacks with the bladder. Undoubtedly this is very bad, but undoubtedly there is some fun in it. Compare it with the funny efforts of some of the men that every little while furnish the pure and elaborate fun to the editorial page of some of the other papers, and the latter very often seems very wooden. The laugh of *The Herald* may be wicked, but it is not forced, and one feels, too, that *The Herald* is all the time, and not very secretly, laughing at itself as well as at something else existent or supposed to be existent.

To *The Herald*, we think, more than to any other newspaper, or to any half-dozen other newspapers, it is due that we are without an American *Punch*. But the credit or discredit of this state of affairs is, after all, to be distributed throughout newspaperdom. And this being so, why is it so? Why is it that our journals of news and politics supply us with a sort of reading which, it is said, ought to be left to journals of less dignity especially devoted to it. People give various answers to this question. Some of them go so deep as to the difference which has been wrought in the Anglo-Saxon man by his communion with Niagara, the prairies, the unbroken forest, the wild and free institutions of our democratic country, our habitual scorn of laws or disregard of the small proprieties, the infraction of which or the pressure of which gives the satirists of *Punch* so much of their game. It is possible that it may be worth while for the philosophic eye to pierce so deep, and we shall be very glad of an answer when one is found. For ourselves, we are inclined to think that when we are a little richer and a little more educated, when the principle of the division of labor begins to be more widely and effectually operated in things outside of manufacturing, then newspapers will confine themselves more strictly to particular fields of labor, and the journalist will not be compelled at one and the same time to collect news, write leaders, run for Congress, keep an eye on the religious world, prepare scraps of personal gossip, and fill a funny column or two. But the matter is at present a mystery.

ENGLAND.

London, July 1, 1867.

Though Mr. Murphy and his doings at Birmingham are vulgar enough, I cannot help regarding them as more or less ominous. I feel convinced, for more reasons than I could well put into a letter, that our present political discussions and reforms will lead to such a discussion of religious questions as there has not been in England since the Reformation, and as is not likely to take place in any other country in half such a practical or interesting shape. The existence of the Established Church, and the fact that Parliament is its governing body, give a scope and object to religious discussion in England which attach to it hardly anywhere else. With you, for instance, religious discussion has its own sphere, and there are few if any points, I suppose, at which religion and politics could intersect, though even you, I take it, may some day or other find yourselves confronted by quasi-religious problems which will give you a good deal of trouble. How, for instance, will you deal with Mormonism? That, however, is your affair. Here in England we have half-a-dozen points in which politics and religion run into each other, and, as our Government is not in a position to deal with such questions as the French or Prussian Government can deal with them—as our clergy, of whatever denomination, neither are nor can be treated as mere functionaries, the result is that our religious differences attract great attention, have a great influence in political life, and excite a degree of discussion and an intensity of interest which, from what I have heard, I believe to be hardly equalled elsewhere. One of our principal German scholars lately told me that a great German bookseller had lately told him that about a third, I am not sure that he did not say a half, of the books published in Germany on religious subjects were sold in England. To see how many points there are, with us, on which religious differences can find expression in political life, you have only to remember that Parliament has to consider the question of the constitution of the Established Church, including such points as the terms of subscription to its articles to be required of the clergy, the character of its ritual; the question of the existence of the Established Church in Ireland (on which there was a remarkable debate the other day in the House of Lords); the question of the Irish Roman Catholic clergy; the question of education in England, and herein, as the law-books say, the question of university education, the question of education in endowed schools, the question of education in subsidized schools; the question of education in Ireland, subject to the same, or nearly the same, division; a variety of questions about marriage; and many other topics, all of which are more or less mixed up with theology and affected by the views which people take of it. These points of connection between theology and politics might, perhaps, attract little attention in times when theological speculation attracted little attention, but in an age when such speculation is active, their existence may at any time lead to practical results of which it would be very difficult for any man to predict the end. No one can have watched the course of English thought for the last twenty-five or thirty years with any degree of intelligence or sympathy without seeing that a progress has been, and still is, taking place in theology by no means unlike the progress which has been taking place about reform. People talked and wrote and talked again about reform (just as they did about the corn laws) for many years without ever realizing the fact that it really was necessary to come to a decision upon the subject, and to act upon it practically. They have formed their decision now, and are quite surprised to find what an immensely long stride towards democracy everybody was in his heart prepared to take if he was absolutely driven into realizing and acting upon his own convictions. You will see, I think, though I cannot even guess the precise form which the question will take, that sooner or later the English people will find it practically necessary to decide whether they are or are not satisfied with, and if so, with which of, the forms of religion which are at present competing for their allegiance. When they fully realize the fact that there is a question upon this subject, and that the question is one which can no longer be shirked, it will be answered, and what the answer will be no man living can tell. Many people will tell you that there has been an immense reaction toward Popery, and that there is a chance that England may become once more a Roman Catholic country. I, for my part, altogether disbelieve that; but I have no doubt we shall have before long singularly troubled waters, and that the Pope and his clergy will fish in them with more or less success; but, viewing the nation as a whole, I think its progress will be in the direction of liberalism in some form. What form, I cannot even guess. The common answer is that the Church establishment will be destroyed sooner or later. I do not myself think this would be a move in the liberal direction, nor do I think the general question can be got rid of by transferring it from the

sphere of politics to the sphere of private opinion. But I must not run into the department of prophecy.

One small fact may interest you. A little knot of Positivists—disciples of Comte—consider that they have solved the great question of the religion of the future. They meet and do whatever is their substitute for praying once a week, near the Temple, in a small upper chamber, which holds about sixty people—most, if not all, of whom belong to the imaginative classes. Mr. Congreve, formerly tutor of Wadham College, Oxford, is their high priest, and preaches to them the doctrine that if there had been a God, Comte would have been his prophet, if one had been required, but that things are much better managed as they are. I must own, Positivists always remind me of Talleyrand's observation to Lepaux (Lepaux of the Anti-Jacobin) upon theophilanthropism, "I have but a single observation to make. Jesus Christ, to found his religion, suffered himself to be crucified, and he rose again. You should try to do as much."

The second subject on which I meant to have addressed you was the revelations which have lately been made about the trades-union proceedings at Sheffield, but I must reserve that for another time.

PARIS GOSSIP.

PARIS, July 1, 1867.

THE concerts of the "genuine original" Strauss, of Vienna, continue more brilliantly successful than ever—a success shared by everything connected, however remotely, with the Austrian section of the Exhibition, and Austria itself, which the Parisians are petting out of anger against Prussia. Ling-Lok, the Chinese conjuror, has been performing his feat of swallowing an enormous sword and a basketful of eggs in presence of a company of *savans*, who have failed to discover the nature of the trick, and have publicly recorded their conviction that he is the most astounding conjuror in existence. Madame Rachel, the renowned "enameller of ladies," is giving lectures to the women of the modern "Vanity Fair" on "health and beauty," and thus recruiting subjects for the exercise of her meretricious and unwholesome arts. And to sum up the list of recent arrivals, we have "Professor Siemmes, of London and Liverpool," who deserves to have his likeness placed on a pedestal by grateful humanity, having devoted fifteen years to the work of investigating the nature of corns and other similar pedal excrescences, and to devising methods for their safe and painless removal.

For the benefit of the victims of one of the most painful and troublesome ills that boot-wearing flesh is heir to, let it be proclaimed from the housetops of impartial testimony that the "Professor"—a German, long and honorably known in England—is by no means to be classed with the host of charlatans who make a trade of deceiving the afflicted. He is a genius in his way; and he performs all that he promises. A host of princes, dukes, and lesser glories, enthusiastic in his praise, are unanimous in declaring that his system of extraction is both effectual and absolutely without pain. Nothing can be simpler or more expeditious than his treatment. He takes your foot gently in hand, places it upon a napkin on his knee; ascertains, with the aid of a magnifying-glass, the precise situation of the "roots" of *the* corn, applies a small quantity of an oily yellow salve to the suffering surface, and at once, with the aid of a pair of fine tweezers, draws out from the corn the sharp spikes, in substance resembling horn, several of which often exist in a single corn, and which constitute the heart of the mischief. This being done—generally in less time than I have taken in describing the operation—and the professor having presented you with the peg-like spikes he has just extracted, daintily held between the points of the tweezers, you no longer wonder at the suffering so often occasioned by excrescences of this kind. These extractions, as performed by Professor Siemmes, cause no pain whatever; in fact you feel nothing, and are only aware of what is going on from seeing him at work upon your foot. When the spikes in question (which are really the "corn") have been extracted, the professor gently pares away the dead skin which has generally formed around them, and applies to the spot a bit of diachylon plaister, which you wear for a few days, to protect it while the new skin is forming. No rest or special precaution of any kind is needed. You don your ordinary footgear, and walk about as usual, with no other consciousness than that of a welcome deliverance from a familiar pest.

With a view to providing the best possible facilities for the acquisition, during boyhood, of the four principal European tongues, by the youth of England, France, Germany, and Italy, a limited joint-stock company, styled "The International Educational Society," was formed, some years ago, by a group of progressive-minded men of those countries, under the auspices of the late enlightened and excellent advocate of free-trade and of international friendship, Richard Cobden. This company, of which Mr. Cobden was president until his death, has founded a college at Spring Grove, in the suburbs of London; another in the neighborhood of Bonn; and a third at Chatou, a few miles from this city, on the railway line to St. Germain. The corresponding Italian college is not yet founded; but will probably be founded before long. These institutions are conducted on a common plan, and are in constant correspondence with each other. The pupils whom it is purposed to educate in them usually begin with the college in their own country; a thorough knowledge of their native tongue being regarded as indispensable to the easy and effectual acquirement of other tongues. When this basis has been fairly laid, the pupil is sent to the foreign colleges, one after the other, at the choice of his parents; continuing the course of study already begun by him, with the sole difference that his studies will now be conducted in the tongue of the country to which he has been sent. In this way, while being fitted, as usual, for entering any university in which it may be intended to complete his education, a youth who has been trained in the colleges of the society will find himself, on his entrance into practical life, thoroughly in possession of the four most important and useful languages of modern days; an advantage whose value—practical, intellectual, and social—will be readily admitted. The course of study adopted in these colleges is large and thorough; the boarding arrangements are superior to those of the great run of schools, and the terms moderate.

A very curious old work on arithmetic has lately been brought to light, being a manuscript of Abbo, who in the tenth century was Abbot of Fleury, and taught the science of counting to his monks. The learned churchman says in his preface:

"As some time ago I was explaining the *calculus* of Victorius to my brethren, they begged me to write a commentary upon it that might remove all difficulties. . . . From my earliest youth I have grieved at seeing the liberal arts neglected, and left to but a few persons, who make people pay dear for their lessons. . . . I will strike the ignorant minds," continues the worthy abbot, "I will build a bridge of introduction to arithmetic. Victorius teaches how to make multiplications and divisions of numbers without making mistakes, both in questions relating to the sciences connected with numbers, such as arithmetic, geometry, music, and astronomy, and also in questions relating to weights and measures."

The abbot, having talked of all possible subjects in his book, gets at last to the "Abacus," when he enters at length into the explanation of digital arithmetic, or the art of expressing numbers by the fingers, as then practised, and lays down the following rule:

"If you multiply a single finger by tens, each finger must stand for ten, and each joint for one hundred. If you multiply tens by tens, then each finger stands for one hundred and each joint for one thousand."

Imagine the ease, rapidity, and capacity of a system of numerical combinations established upon such a basis! But the author of the unique old relic in question appears to have been thoroughly satisfied with his work, and winds up his dissertation with the following verse in Monkish Latin:

"*Hic Abbas Abaci doctor dat se Abbo quieti.*"

("Here the Abbot Abbo, teacher of the Abacus, gives himself up to repose.")

The "schoolmaster abroad" of the present age has, happily, something rather more effectual to give his pupils in the way of calculation; but that he has still a good deal to do, even among people who consider themselves enlightened, would seem to be implied in the fact that the most popular of the Paris daily papers, in its number of a few days ago, informs its readers, *apropos* of a quotation from the Boston *Advertiser*, anent the Maine Liquor Law, that "the Maine is one of the States of the American Union, on the north of Canada;" while a subsequent number of the same popular sheet in recounting the pedestrian feats of an Englishman who is said to be walking through all the countries of the globe, remarks: "On leaving Japan he went to Batavia, where he was at last advices, and whence he was intending to proceed, *still on foot*, to Sydney, in Australia."

Correspondence.

JOHN VANDERLYN, THE AMERICAN ARTIST.

TO THE EDITOR OF THE NATION:

A pleasant paper in *The Atlantic Monthly* for February last, respecting the old painter above named, invites additions, or the supply of omissions, which I chance to be able to make, and which, I think, will fill out some features of the "Recollections" that are only, and doubtfully, alluded to by the writer.

I was personally and well acquainted with Mr. Vanderlyn, and, strange

to say, under very similar circumstances and relations to those reported in *The Atlantic* by its California contributor. My father had been Vanderlyn's friend during the period of my childhood; the artist spent a whole winter at our house painting two family portraits, and prolonged his visit and the sittings until all parties were wearied of his slow work, and the room he had darkened into an *atelier* was much wanted by the family. This was soon after Mr. Vanderlyn's return from France (1809 or 1810), when he was projecting the rotunda for panoramic paintings at New York. He was very sanguine of making a fortune, as well as awakening a love of art in this country, by the introduction of good pictures of that kind, two of which he had brought over with him. The one I remember particularly was a panoramic view of the palace and gardens of Versailles, painted by himself from sketches taken on the spot. It was exhibited in a frame building on the northwest corner of Eleventh and Market Streets, in Philadelphia, there being then no suitable place; and this Mr. Vanderlyn had altered and fitted up, while looking forward to a permanent and proper building in New York. I think the other panoramic picture was of the City of Mexico, by an English artist who stood high in Mr. Vanderlyn's opinion. I remember seeing the view of the palace and gardens of Versailles, and being much pleased and astonished by its seeming realities; it was the first panorama I had ever seen, and I recall having gratified the painter by recognizing, in the figure of a gentleman walking in the gardens, Mr. —— Carter, of Virginia. Vanderlyn smilingly said "*it was taken for him, he being there at the time.*" The peculiar step and well-made person of Mr. C. were admirably hit, and he was among the wealthy American gentlemen in Paris who admired and befriended Vanderlyn as an artist.

The California contributor of *The Atlantic* says he has lost all trace of Vanderlyn's fine picture of "Ariadne, the Sleeping Beauty." Mr. Vanderlyn told me he had borrowed money upon it in New York, and finally had to part with it (for much less than he liked) to the mortgagee, who, I understood him to say, was Durand, the engraver.

But my personal and better knowledge of Mr. Vanderlyn was in the period of his old age, when he went to France to paint his picture of the "Landing of Columbus" for a panel of the rotunda at the Capitol. The time allowed by Congress for producing the work had expired, and Mr. Vanderlyn having received peremptory orders from the State Department to bring his picture of Columbus home, the poor old gentleman wrote me from Paris, complaining bitterly of Mr. Buchanan, then Secretary of State, and indulging his habitual spleen in regard to the want of consideration for art and artists in this country. He stated that the picture was unfinished; that, being deceived by an agent to whom he had entrusted the larger part of the money received on account of his Columbus, he had been obliged to give much of his time to portrait painting for his daily bread. This, together with ill health, he said, had caused the delay. And now, with some debts which he could not pay, and without money to meet the expenses of a return to the United States, he had been ordered, in no very polite terms, to bring the picture home at once, finished or not. The old gentleman's letter then suggested the only plan by which he could obey orders, viz., contributions or advances from a few friends (named) in such amounts as would make up the sum he required—a few hundred dollars.

It was no very difficult or unpleasant task to comply with the old artist's wishes and relieve him from his painful position, so that he came back to the country bringing his unfinished Columbus and grateful for the prompt aid afforded him. It is scarcely just in Mr. Vanderlyn's California friend, however kindly meant, to attribute the deficiencies of the Columbus entirely to the artist's employing young French painters to do the work at Paris. I saw him at the Capitol busy finishing it, and although he then had assistance on unimportant parts of the painting, he worked assiduously upon it with his own hand, and directed what he did not touch. It was not easy for a man of Mr. Vanderlyn's advanced years to climb up ladders and temporary scaffolds, and the figure of Columbus himself and other prominent persons of the eventful scene, being within his easy reach, naturally secured the artist's special attention.

Not long after seeing Mr. Vanderlyn at Washington City he wrote me that he wanted portraits to paint, particularly among public men, and asked for letters that would be likely to bring him such sitters. It is my good fortune to possess an excellent portrait, then painted by him for me, of the Hon. George E. Badger, of North Carolina. In my letter to Mr. Badger, knowing his great reluctance to sit for his likeness, I urged upon him the peculiar position of an old American artist, no less than my personal claims as a friend; and during the many tedious sittings, I well remember the wit and patient benevolence with which the excellent man and distinguished senator remarked upon his "sacrifice of himself on the altars of patriotism and friendship." He said, "It is not only that I have an endless number of sittings, but that I must sit and sit still."

Thus did Mr. Vanderlyn manage to live to finish his Columbus at the Capitol, and then to obtain payment of the last instalment upon his work. I do not agree with the San Francisco writer as to the cause of the unfavorable distinctions he draws between Vanderlyn's earlier paintings and that of Columbus—his last of any note. Some difference may reasonably be put to the account of old age, but the glare or objectionable coloring complained of in the picture of the "Landing of Columbus" seems to belong properly to the characteristic and flashy costumes of the Spaniards and native Mexicans of the period.*

It is appropriate for me to say here that, soon after the death of Mr. Vanderlyn, I was applied to by a friend of his family for letters written to me by the deceased artist, my numerous letters found among his papers showing that they were replies to as many written by himself during a long period of friendly intercourse. I was informed that Mr. V.'s letters were to be used in a life of the artist then preparing for publication in New York. I remember having furnished such letters as I thought would subserve the object, but I have yet to hear that any such work has been issued by the press of that city.

The Week.

CONGRESS adjourned on Saturday to the 21st of November. The chief bills passed during the week were the Reconstruction bill and that making the necessary appropriations to carry it into effect—on Friday, over the President's veto; the House bill for the relief of nominal deserters from the army and navy, with Senator Wilson's amendment, allowing no remittance of forfeiture of back pay, etc.; Mr. Henderson's bill for establishing peace with certain Indian tribes now at war with the United States—a practical measure for the security of travel through the Territories and for the selection of a new area sufficient to contain all the unsettled tribes east of the Rocky Mountains, and fit for tillage and pasturage; and Mr. Sumner's bill to allow colored people to hold office in the District of Columbia—which, of course, the President pocketed without signing. The principal interest of the debates was on Friday, when the veto message came in to the House. Mr. Stevens held the reins of the previous question in his hand, but good-humoredly slackened them to allow an earnest, almost impassioned speech from Mr. Boutwell, arguing the duty of immediate impeachment. General Butler followed with a "quousque tandem," but contented himself with confuting the positions of the message. Mr. Williams, of the Impeachment Committee, was quite ready to begin operations. The chairman, Mr. Wilson, on the contrary, was neither to be coaxed nor pressed into swerving from the conscientious discharge of his duty—that is, into reporting, as his colleagues had been doing, before it was time. When he had finished, Mr. Stevens, who had previously given up impeachment on account of "unseen agencies" and "invisible powers" at work against it, called for the vote, and obtained a verdict of 100 to 22 against the President.

The close of the session was marked by some snarling in the Senate and some confusion in the House. In the Senate, Messrs. Chandler and Fessenden had a regular "set-to" in the old-fashioned style, in which "scorn" was flung to and fro with great vigor. The amount of this commodity which is consumed in Congress in the course of a single session during the "spicy" personal debates, would astonish the public, if it could be set down in figures. Mr. Fessenden, besides being very conservative in temperament, is rather tart in manner, but has a sharp, clear, business mind, and marches straight to the point with precision. The small amount of sympathy existing between such a man and Radicals like Messrs. Sumner and Chandler can be readily imagined, and Mr. Sumner, in particular, has undergone several severe maulings at his hands, many of them entirely unprovoked, and all borne with great patience and good temper. When Mr. Chandler and Mr. Fessenden attempt to work together, however, the scene very much resembles the efforts of an Austrian drill-sergeant to put a bashi-bazouk through the manual of arms. With Mr. Chandler's peculiar style of warfare, and his particular "ideas," most people are familiar, and few, therefore, will be surprised to learn that when he is not extravagant he is abusive, and that in this last bout with Mr. Fessenden he was both.

The President contributed another veto message at the close of the session, in which he repeated what he has said a good many times before, adding that he would "never willingly execute the law"—a phrase out of which some of the supporters of the impeachment tried to extract some comfort, but which of course revealed nothing which we did not already know. The question which interests the public is not what his state of mind will be when he executes the law, but whether he will execute it at all; and there is every reason to believe that he will execute it—not heartily or zealously, perhaps, but after his fashion, and as long as Grant and Sheridan, Sickles and Pope, are in office his fashion will suffice. The comparison of him to James II. and George III. made by one eloquent advocate of impeachment is hardly correct. If the English people had felt sure of getting rid of James in the year 1689, they would certainly never have disturbed him and sent for William of Orange in 1688; and if the American people had felt sure of being relieved of the rule of George III. and of being placed in full enjoyment of their constitutional rights in the year 1779, they would hardly have begun an armed revolution in 1775.

Mr. Greeley has been nominated for the Austrian Mission, and as the Senate adjourned without confirming or rejecting him, he might, of course, go if he pleased; but he announces that he shall decline. He is in principle opposed to the maintenance of foreign missions, and he is by nature anything but a diplomatist. We may add, too, that the Austrian Court is perhaps that one of all in which Mr. Greeley would possess least influence, as it is that in which conventionalism is most worshipped. Mr. Greeley with all his faults is a power in the United States, and at foreign courts a power he would not be; therefore, we hoped he would treat all advice like that of the New York *Times*, encouraging him to start for Vienna, as the advice of an enemy in disguise, but we perceive he takes it as kindly and well meant.

The very fact that General Butler is a lawyer sometimes damages his cause as a legislator. His charge, on the strength of the Booth diary, that Mrs. Surratt was judicially murdered, transferred from the jury to Congress became a weak sensation that brought its inventor not a particle of credit. Last week he was visited in the House with the old reproach about the exchange of prisoners during the war. We have never had reason to think him culpable in that matter, and, after all that has been said, his part in it is perhaps as honorable and as indicative of his ability as any incident in his military career. In replying, therefore, to Mr. Eldridge and *The National Intelligencer*, he certainly went out of his way to assert that the sworn testimony in a court of justice had lately shown that paper to be the accredited agent of the assassin Booth. No doubt Booth chose deliberately a journal of rebel sympathies in which to publish his *post factum* justification, but it was quite possible for him to have preferred (say) Forney's *Chronicle* or the New York *Tribune;* and as a piece of news, either of those papers would have been very glad to receive it.

We are just now a good deal troubled by the condition of Mexico, and some restless Democrats are trying to inaugurate a movement to establish a protectorate over her. We venture to say, however, that no such state of things as is described in the article in the last number of *The North American Review*, on the Judiciary of this city, is to be found either in Mexico or in any other civilized country, and we have not yet heard or seen one word of horror, or astonishment, or indignation from any Democratic man or organ. Of the Republican papers *The Tribune* is the only one which seems to have thought it worthy of attention. The Citizens' Association is silent, and so is the bar, and so are the judges themselves. Although the charges thus solemnly made against some of their number would damn any man of whom they were true to the lowest infamy, they take no notice of them, and sit down smiling and apparently contented in their shame. Anarchy is a bad thing, but there are worse things than anarchy, and a corrupt and debased civilization is one of them; and it would seem as if we should shortly be able to exhibit a very finished specimen of it in this city.

The activity of the Republican leaders in preoccupying the South for their party is forcibly revealed in the circular of the Union Republican Congressional Executive Committee, dated at Washington, the 20th inst. With less than twenty thousand dollars, but through unstinted use of the franking privilege, a Republican organization has been established in every State, and over seventy speakers and organizers of both colors have been employed. There are now twenty thousand loyal persons at the South to whom documents are regularly transmitted, and who in turn distribute what they receive to four times their number; and every Congressional district is in communication with the committee. Since the passage of the military bills the fifteen Republican journals have been sextupled, and among them are twenty dailies. Of course the poverty of all classes at the South compels them for the present to depend wholly on Northern assistance in this campaign; yet the committee say that under their stimulus, "in many localities, funds have been raised to defray the expenses of local agents and much work accomplished." More money and more documents are needed to carry every State. The committee have faith that this can be done, and those who wish to help make it sure can communicate with their secretary, Hon. Thomas L. Tullock.

Mr. G. W. Curtis made a strong speech in behalf of female suffrage in the New York Constitutional Convention this week. The speech has been very imperfectly reported, so that it is scarcely possible to criticise it fairly. So far as we have been able to get an idea of it from the summary published by the daily papers, all that portion of it which deduced woman's right to vote from her right to be well governed, and which sought to base her claims on expediency and on experience, was excellent, and all that portion of the argument which made her right to vote a natural right was, to our view, fallacious. The natural right to vote involves the natural right to govern other people, or, in other words, the divine right of the majority, which Mr. Curtis no doubt, as well as we, would be very sorry to concede.

John Minor Botts is now one of the most active and thorough apostles of the Republican faith and the Congressional policy at the South. He is a candidate for the Virginia State Convention, spends his Fourth of July at Culpepper addressing the blacks, and urging them to send representatives of their own color to the convention, and makes the usual profession of faith of a delegate *in petto*, in a letter to "James H. Barrister, Alexander Jackson, and other colored friends." His tenth article is "universal amnesty and restoration to the great body of the people, who were misled or seduced into the war by the more artful or wicked men, but exclusion from all political power hereafter to those who were instrumental, either by speaking, writing, or preaching, in bringing on the war." Mr. Botts is supported in doctrine by Governor Peirpoint, and both lay a proper stress on public education. Undoubtedly the free-school system will be adopted by every Southern State as part of the new basis on which to re-enter the Union; and it is well to remember that this revolution is principally due to the practical workings of the freedmen's schools established by the voluntary benevolence of Northern citizens, aided by generous contributions from abroad. As these schools, again, determine the current of immigration and confirm the predominance of Republican principles at the South, the political wisdom of the Freedmen's Aid Societies is very strikingly illustrated.

"How, for instance," asked our London correspondent last week, "will you deal with Mormonism?" Mr. Bowles has answered, Run the Pacific Railroad through Salt Lake City. That expedient will be tried presently; but the Mormonism of Brigham Young is at this moment exposed to greater dangers from within—greater, even, than if the Government were to forbid the importation of Scandinavians into the country. The anti-polygamous branch of Mormondom which was reunited in 1860 by Joseph Smith, Jr., and has now its seat at Plano, Illinois, the State which bloodily expelled the original founder and his followers, is making proselytes not only in Europe, but even in Utah. The "Josephites" denounce the "Brighamites," and if the martyr's son were not afraid of turning martyr himself, he would undoubtedly contest the primacy of the faithful in the Salt Lake tabernacle. Within the immediate sphere of Brigham Young's despotic authority, little has as yet been accomplished; but outside the City of the Saints, the Illinois emissaries are preaching with some success, and do good service in meeting and turning back the fresh accessions to the Utah colony. About a month ago Brigham, we quote from *The Vidette*, an eye-witness, "boldly and openly announced that Amasa Lyman, Orson Hyde, and Orson Pratt had apostatized and were cut off from the Church." These three men were then, or had been, members of the Quorum of Twelve—the Apostolic body that ranks second in the Mormon hierarchy—and Lyman was actually their president. Pratt is returning from a missionary tour in England, and the other two are in Southern Utah beyond Brigham's reach. They are accounted among the ablest and most intelligent members of the Church, which they have aided powerfully to sustain. We do not gather that they were really heretics, but it is possible they could not brook Brigham's intention to make the presidency hereditary in his own line, and nothing would be more natural, in order to divest themselves of the appearance of selfish motives, than to take up the complaint of usurpation preferred by the Josephites against Brigham, in behalf of their present leader, the lawful and ordained heir of the martyr. Other factions and secessions *en masse* are reported, and the issue of the struggle deserves to be watched by the trans-Atlantic pupils of Mr. Hepworth Dixon.

The College Regatta at Worcester, last Friday, was not so remarkable for the mere victory of Harvard over Yale as it was for the diminution of the time hitherto supposed necessary for accomplishing a three-mile course. Indeed, if, as asserted, the course was lengthened this year by twenty seconds, the difference between the Harvard's time and that previously recorded as best is astonishing. It is clear that neither in horse-racing nor in rowing have we done our "possible," but whether we need do more in order to have healthy men and the best breed of horses is perhaps open to question. In rowing, it may be thought, "the trial still is the strength's complement," but the axiom holds rather of morals than of muscles. Fortunately, this year we have to record no serious injury to any of the contesting oarsmen, the weather having kindly removed the chance of sunstroke; we notice, however, the death of a member of Brown University, superinduced by excessive exercise in a match game of base-ball prior to those at Worcester.

We do not remember to have read any treatise on that great American institution—the serenade. Midnight music, other than that of hand-organs, is, of course, not an American invention; in one form or other it must be very nearly as old as the art of love. The Spanish lover, the Italian lover, and the German lover are adepts in it. It is the common form of attention to "the fair sex" in all civilized countries, and probably in some which are only barbarous. With us the serenade is not wasted on sentiment or on women. Once in a while we start from our beds, rush to the window, and would fain appropriate to ourselves the compliment intended for a neighbor across the way or in the next block. It is a novelty of which we do not fail to speak the next morning at breakfast. In general, the men get serenaded,

and when this happens to the lucky candidate on election night, we know that the party pays the bill for the music, and he for the refreshments. But it often happens as it were spontaneously, and then, we confess, we do not always know who pays the bills. In its most harmless application the serenade is merely a corkscrew to the bottle, or a spigot to the vat, of eloquence: the crowd turns, and the orator pours. Maliciously employed, it becomes a thumb-screw or any other instrument of torture. It was thus applied to Mr. Johnson's cabinet in the memorable February of last year. The party of reaction that induced the President to make the speech which Mr. Seward thought "saved the country," wanted to force Mr. Stanton to take sides at the risk of his place. Mr. Stanton appeared, but did not disappear, as was hoped. The serenade given the other night in Washington to the retiring Congressmen was of the innocent sort, and to it we are indebted for a very good speech from Speaker Colfax, who, in a few words, proved that every sin charged upon Congress had been first committed by the President, except that of forgetting to perpetuate distinctions of color.

One of those touching incidents which refute Mr. Hawthorne's excuse for seeking the subject of his last novel in Italy—that there were no gloomy wrongs at home (slavery was not then abolished), in short, no stuff for fiction—is the recent reunion of Frederick Douglass with his brother Perry, who had been forty years separated from him by the common lot of Southern bondage. We are inclined to think that the romance of American slavery has not been exhausted by Hildreth and Mrs. Stowe, but that it will support a host of novelists for many years to come. The very facts of slavery—the truth which is stranger than fiction—may yet form the staple of volumes; and fifty years hence the diaries and account-books of the planters, some of which fell by abandonment into Union hands, will be ripe for publication in aid of history.

Mr. Garrison continues to receive warm testimonials of respect in Great Britain, the last being the presentation to him of the freedom of the City by the corporation of Edinburgh. There has been a subsidence of the faint praise of a portion of the press, and even the highly cultivated and philosophical view of his career taken by *The Pall Mall Gazette* has met with but indifferent success.

The European news is singularly meagre and unimportant. The sudden stop put to the great fêtes in Paris by the news of Maximilian's death has borne very hard on the Cable newsman, who has had in consequence a week of great barrenness. No more balls, no more reviews or processions. In this extremity he has gone back to his occupation of last spring, and for a day or two has been "arming" France for war, and has been "filling" Europe with uneasiness. Judging from his accounts, the people of Europe must lead a horrid life. One anxiety is no sooner over than they are plunged into another, keener and more torturing than the last. They have hardly got over the agony of hearing of Maximilian's death when they behold Louis Napoleon arming and buying horses, and are forced into fearing a bloody war "in their midst." In France the mourning for Maximilian still continues, and the emperor, no doubt, mourns sincerely, and would give much to recall the irrevocable. The story of his sorrow is, perhaps, not so dramatic as lively writers would like to have it. The scene on which the New York *Tribune* based a "thrilling" article, representing the presentation of the despatch announcing Maximilian's death to the modern "Belshazzar" as he sat on his throne in the Great Exposition, the horrible pallor of his guilty countenance, the strange, lurid light which flashed from his diamonds as he read it, was, of course, what the artists call "a composition," and came, perhaps, from the same fertile brain which described the death agonies of P. T. Barnum's lions and tigers in the fire which destroyed that worthy man's Original American Museum. But no coloring or composition is needed to make Louis Napoleon's situation horrible, or make his sorrow seem real. He talks of going to Vienna, but it is hard to see what consolation his presence would carry to the Hapsburgs, in whose annals the past year has been truly a year of woe, filled with defeat, disaster, death.

In England, the business of the week has been the entertainment of the Sultan and the King (late Viceroy) of Egypt. The Sultan has been magnificently lodged in Buckingham Palace, the Prince of Wales acting as host in the absence of the Queen, who is still mourning in the Scotch Highlands. There was considerable trouble about the King, for whose accommodation no provision was made till the last moment, although he entertains every Englishman of rank who passes through Egypt with a princely hospitality. It was then determined to put him up in a hotel—or, as the newspapers in their rage call it, a "public house"—and have the bill paid by a Parliamentary vote, when for very shame Lord Dudley, the great mining peer, came to the rescue, and offered him one of the most magnificent private houses in the world. The matter has excited more feeling than on the surface it seems to merit, inasmuch as it has seriously increased the long growing dissatisfaction with the Queen for her failure to perform the important duties of her station. There is little left now for a constitutional monarch to do in England, except entertain distinguished strangers, and this the Queen flatly refuses to do. She will not even entertain native society, and what with her absence and the long illness of the Princess of Wales, native society is getting alarmingly accustomed to doing without a royal head. Thus it comes that Conservatives are, on this occasion, angrier than the Radicals.

The attention paid to the Sultan both in France and England is vastly out of proportion to his real power; he reigns over 40,000,000 of people, but he cannot be said to more than half rule them. But all the Great Powers compete for influence over him in the hope of having the start of the others whenever the "Eastern question" really comes to a crisis. The enthusiasm of the people is easily explained. The Sultan is the heir of more romance than any other official personage in the modern world, the awful, dark, implacable husband of ever-so-many wives, the lord of ever-so-many concubines, the "Eastern tyrant" of ever-so-many ages of poetry and story. All other monarchs have become commonplace modern gentlemen; he has done so in nothing but his clothes, which are always badly made. Either the Turkish frame does not suit Christian tailoring, or the Sultan's tailors are the worst of their kind. The dark side of his fêteing was, that while he was riding gloriously through the shouting crowds in Paris and London streets, his Cretan vassals were dying by inches on the hillsides of Candia or in the alleys of the Levantine cities for a cause which all the world professes to have at heart, and of which the sultans have for four centuries been the worst and most barbarous enemies.

The latest sensation is the proposed United States protectorate of Mexico, with a view to annexation. This beautiful scheme for rebuking Napoleon without violating the Monroe Doctrine (which only concerns foreign intervention) might have occurred to a good many minds, but, if we may trust the rumor, its author is none other than a brother of Mr. J. S. C. Abbott, the historian. We are afraid it will not receive the attention it deserves. The compulsory protectorate of the Southern States, with a view to annexation, and of Walrussia in consequence of annexation, makes it inexpedient to attempt to cover more territory with the limited wings of our national bird. When General Sherman gets more than one soldier for every three thousand square miles of hostile Indians, it will be time to talk with Mr. Abbott—on some other subject with which he is more familiar.

Santa Anna's fate seems to be still in doubt, but the Mexican public inclines to the belief that he will be shot. The shooting of Maximilian's officers still continues. Since 1793, in France, there has hardly ever been such a glorious vindication of republican liberty against foreign tyrants. If Mexico is not improved by the present process it must be a very remarkable country—that is, if such a brave people needs improvement. It is not every nation that would have the courage to kill an unarmed emperor and scores of generals inside the same month, read and publish their dying letters to their wives, and embalm their bodies for sale to their relatives. What makes this great work all the more interesting is that it is intended as a protest against the "Church Party," which has been at the bottom of all Mexican troubles.

Notes.

LITERARY.

"Tout le monde chôme"—it is everybody's holiday, though in such comfortable July weather it is clear that more vacations are determined by the calendar and by custom than by the thermometer. One might safely guess that those who have taken refuge in the mountains are wishing themselves back again in the city, and hugging wood fires in damp hotel parlors, and finding with dismay that the books they had thought sufficient to outlast their stay will be quite read through before a genial temperature permits excursions. Publishers, we suppose, are as much bound as schoolteachers to escape from care and routine during this month and the following. If any remain at their desks, they refuse to take advantage of a rival's absence, and this, with the prevailing dulness in every branch of business, produces general inactivity in the bookstores, and consequent meagreness in the announcements which we usually glean from them. Messrs. G. P. Putnam & Son publish this week their work on free trade, founded on Bastiat's "Sophismes," and announce as in press an American edition of Haydn's "Dictionary of Dates," with additions to August, 1867, making a very large volume of 1,000 pages; a new revised edition of "The World's Progress," a manual of universal reference, for the use of schools, brought down to the present month; "The Legende of St. Gwendoline," with eight photographic illustrations, after drawings by Ehninger, quarto; "The Book of Landscape," with sixteen steel engravings from pictures of well-known New York artists, folio—a new edition of a very handsome publication, for which Bryant, Bayard Taylor, Tuckerman, etc., furnished the letter-press; Tuckerman's large work on "American Art and Artist Life," in three editions, one quarto; "Portia, and other Stories of the Early Days of Shakespeare's Heroines," by Mary Cowden Clarke, ingenious romances for the age of sixteen or younger, illustrated; and "The Ghost in Boston," a powerful Christmas story, by W. D. O'Connor, that appeared about a dozen years ago in *Putnam's Magazine*. ——Messrs. Leypoldt & Holt will republish two deservedly popular works—they have reached their eighth or ninth edition—by Dr. Pye Henry Chevasse, entitled "Advice to a Wife on the Management of her own Health," and "Advice to a Mother on the Management of her Children." Everybody knows that neither womanly nor maternal instinct can supply altogether, and, in fact, rarely does supply, the place of experience and tradition; and there is so much profitless experience and so much mischievous tradition, that a respectable work which shall supplant both ought to be welcome to almost every family. Messrs. Ticknor & Fields announce "Wool-Gathering," a volume of hitherto unprinted sketches by Gail Hamilton, and "An Arctic Boat Journey in the Autumn of 1864," by Dr. Isaac Hayes, a new and revised edition with illustrations and maps.

—Acquaintance with the language of a foreign country being generally the last and not indispensable requisite of the representatives whom we send there, it would appear to be merely a lucky coincidence that Mr. Eugene Schuyler has been appointed United States Consul at Moscow. The new incumbent had shown, we might almost say, a fatal fitness for the post by his translation of Turgenef's admirable novel, "Fathers and Sons," and his chances would, perhaps, have been hopeless if it had been generally known that he speaks Russian as well as reads it, besides having a knowledge of French, and perhaps one or two more of the Continental tongues. Minister Clay, if he were capable of it, would envy Mr. Consul Schuyler's acquirements; but Mr. Schuyler, if he should remain a dozen years in Moscow, would have no guarantee of promotion. However long he may remain, we hope he will employ his leisure in giving us other translations from Russian authors, and in due time present us in book form with such observations of Russian character, customs, and institutions as it is now exceedingly difficult to obtain, and for which no person is so well qualified, perhaps, as an intelligent American. Viewed in this light, his appointment may be considered a literary event of some interest, and we shall be glad if, contrary to our surmises, it has also a political significance.

—"W. M. R." (William Michael Rossetti?) reviews in *The Chronicle*, the new London weekly, the poems of Walt Whitman, or, rather, deduces from them a critical estimate of the author's place among poets. It is the most temperate of any we have yet seen from Whitman's admirers, and all the stronger on that account. The reviewer believes that a "very extensive and very prominent fame to Mr. Whitman is in prospect, and even inevitable;" thinks that "only a very restricted and literal use of the words rhythm or poetry could deny the claim of these [his] writings to being both poetic and rhythmical," and that they are "of an exceptionally high standard, and with a great future before them." This, in spite of their formlessness, and of acknowledged blemishes of style, such as the use of "a large number of words detestable to the literary sense, sometimes actually misapplied, and, at best, fitted for a Yankee stump orator, but forbidden to a poet." (But does the Yankee stump orator adorn his speeches with *Philosophs, Harbinge, Experient, Orotund*, and the other words cited by "W. M. R."?) Mr. Whitman further appears to him as intensely modern and intensely American, and "may be expected to stand in a relation to future poetic efforts hardly less typical and monumental than the Homeric poems towards Grecian and epic work, or those of Shakespeare towards English and dramatic." This is an unexaggerated version of Mr. (not "Dr.") O'Connor's "open-mouthed" estimate of his friend Walt. Emerson's praise of him is also quoted by the reviewer, who unconsciously explains the possible intellectual sympathy between the two men, when he says of Whitman that "he is sometimes obscure, often fragmentary and indefinite, and too *much addicted to writing on an agglomerative system*, where scores of items succeed each other scarcely to be fagoted together, still less united." When, finally, after saying that "his book is incomparably the *largest* poetic work of our period," he goes on to compare it with Victor Hugo's "Légende des Siècles," he suggests an actual resemblance which is perhaps best seen in the enthusiastic pamphlet of a disciple, "The Good Grey Poet."

—A very valuable work must be "A Memoir of General James Oglethorpe, one of the earliest Reformers of Prison Discipline in England, and the Founder of Georgia, in America," by Robert Wright (London: Chapman & Hall). The predecessor of Howard, the founder of the thirteenth of the afterwards United Colonies, and the esteemed friend of Johnson, Goldsmith, Burke, and the other great Englishmen of the last century, is indeed an interesting and too little known character. Mr. Wright's book, by its very title, bears an incidental refutation of the quondam theory of the Southern chivalry, that they were chiefly descended from English cavaliers and the warm blood of the Mediterranean races. How Virginia, Maryland, and Louisiana were peopled with transported convicts, is no secret. But the very idea of founding Georgia, after making a defence for South Carolina against the Spaniards to the South, was derived from Oglethorpe's investigation into the prison discipline of England; and he selected as the nucleus of his colony discharged debtors, and "those persons at home who had become so desperate in circumstances that they could not rise and hope again without changing the scene and making trial of a different country." To these he added subsequently—for they proved to be wretched stuff—agricultural laborers, Scotch Highlanders, and oppressed Protestants from Germany and other parts of the Continent. He also provided in the patent of the colony that there should be no slavery; and when Georgia changed its government in 1753 and legalized slavery, he and the other trustees resigned their charter, and washed their hands of the iniquity. Oglethorpe is brought near to this generation by the reminiscences of Samuel Rogers. His present biographer has had access to the colonial papers in the British Record Office, which abound in details of the founding of Georgia.

—The importers, too, or their agents abroad, are taking their holiday. Scribner, Welford & Co. have Dr. Forbes Winslow's "Light: Its Influence on Life and Health" (Longmans). In the appendix the author is incautious enough to quote as possibly genuine the poem, "I am old and blind," which has a thousand times at least been attributed to Milton, and less than a thousand times denied to him, and which, though written by a woman at this moment anonymous to us, may fairly be liked on its own merits.—— We commend to the Board of Health Frederick Charles Krepp's "Sewage Question" (Longmans), which gives, to quote the expanded title, a general review of all the systems and methods hitherto employed in various countries for draining large cities and utilizing sewage, with reference to the public health, agriculture, and national economy generally; together with a description of Captain Liernur's system of daily inoffensive removal of fæcal solids, fluids, and gases by pneumatic force, etc.——How the mathematics came, notably through the influence of Isaac Barrow, to assume their present importance in the curriculum at Cambridge, England; how they had to contend against the overweening admiration for antiquity and the classics, which imparted a rhetorical form to the writings of the day and stuffed them with quotations, as witness Jeremy Taylor; how the University adopted Neo-Platonism, and was Royalist during the Cromwellian Revolution, and other like interesting matter, should appear in "Cambridge Characteristics in the Seventeenth Century; or, Studies of the University, and their Influence on the Character and Writings of the most distinguished Graduates during that Period"—a prize essay by James Bass Mullinger (Macmillan).——Christopher Hughes has done into English, side by side with the Latin text, the "Odes, Epodes, Carmen Seculare, and First Satire

of Horace" (Longmans). He has added, what is of considerable value, an index of proper names and of first lines of the Odes. The favorite Lib. I. carmen xxii. is vigorously rendered, the initial line, "Integer vitæ scelerisque purus," being turned into—

"Fuscus, the upright man,
Who will no evil plan."

——"The Law of Creeds in Scotland," by Alexander Taylor Innes, M.A., treats of the legal relation of churches in Scotland, established and not established, to their doctrinal confessions.

—At Mohun & Ebbs's may be found two unique works, one: "Anecdotes, Observations, and Characters of Books and Men. Collected from the Conversations of Mr. Pope and other eminent persons of his time, by the Rev. Joseph Spence." The original work was in two volumes, published in London in 1820. The owner of this copy has interleaved it with engravings and prints of all sorts to illustrate every proper name and place mentioned in the text. The other is a two-volume Pickering edition of Walton's "Complete Angler," treated in the same manner and swelled into four volumes, with a separate, privately-printed index to all the illustrations.—Among other curious books the same firm have a scrap-book collection, folio, very rare, of the etchings of Stefani della Bella, making 184 pages in all, but many times that number of engravings. There is a very wide variety of subjects.—The "Early English Chronicles" is perhaps not to be found complete, in twenty-one volumes, in this country, except in this quarto edition, which may be had for the trifling sum of $600. In fifty-three volumes may be had also the "Revolutionary Memoirs," as the English translation is called of the "Biographie Moderne," from the beginning of the French Revolution to 1811. The imperial edition of the "Histoire de Jules César," quarto, the same which is always presented "with the Author's respects," is within the reach of whoever wishes to emulate the crowned heads of Europe.—Of pictorial works there are here the seven volumes of artists' proof engravings from the Royal or Queen's Gallery, the Vernon Gallery, the Turner Gallery, and other galleries and private collections—a recent magnificent publication; also the art treasures of the Pitti Palace, engraved and published at Florence in 1843. Hachette, in Paris, is publishing in numbers, of which there will be sixty in all, La Fontaine's Fables, with large and small illustrations by Gustave Doré. There will be 248 of the former. The complete edition will cost $15.

—The French Academy has awarded the prize of "haute littérature" to M. Caro for his work, "La Philosophie de Goethe."——The economical and social state of France from Henri IV. to Louis XIV. is the subject of a work by M. Moreau de Jonnès, member of the Institute, which is described as very curious, very learned, and fascinating even in its statistics. The author is a veteran of 89, in a double sense. In '92, as a grenadier, he carried the Tuileries at the head of his section; and more curious than the contents of his book is the fact that his career extends from the death of Rousseau to the present time, and is more or less intimately connected with all the political changes and all the great characters from Danton to Napoleon III., and from the taking of the Bastile to the Great Exposition.

—Two hundred inhabitants of Saint-Etienne complained lately by petition to the French Senate that the city council, in stocking the public library of that place, furnished the works of Voltaire, Rousseau, Proudhon, Michelet, Eugene Sue, George Sand, Balzac, and other more or less famous writers. A special report, condemning this selection, was approved by a large majority of the Senate, but eloquently opposed by Sainte-Beuve, albeit he was in feeble health. His attitude on this occasion procured him a complimentary address from the pupils of the Normal School; and the principal, M. Nisard, having expelled the supposed author, and refused to allow him to return, a general withdrawal ensued, but has since doubtless yielded to a compromise, as such "strikes" are apt to yield.

—The third volume of Professor Curtius's "History of Greece" (Geschichte Griechenlands), forming one of the series of hand-books of classical antiquity begun by Mommsen's celebrated Roman history, has just been published. It is divided into three books—"Sparta's Reign in Greece," "Thebes as a Leading Power of Greece," and "Macedonia and Greece," and treats of the period from the government of Athens by the Thirty to the last struggles of Greece for her independence against Philip of Macedon. The author gives a very clear and critically elaborated picture of the balance of power, the *coups d'état*, conspiracies, and corruptions of political parties in Greece, and their leaders; and he always traces the connection between the civilization of Greece and her political history. Especially graphic and accurate is his estimate of Demosthenes.——Nearly ten years elapsed before the author of "Soll und Haben" (Debit and Credit), a novel which had in Germany a success paralleled only by Goethe's "Werther's Leiden," again brought forward a novel, "The Lost Manuscript," which, we believe, will shortly appear in an English translation. In the intervening period, edition after edition of "Debit and Credit," in every living language of the civilized world, testified to the enthusiasm with which the work of the foremost representative of the realistic school in Germany was appreciated everywhere. Its readers eagerly looked forward for the next production of the novelist; but they were disappointed when it came. Instead of a novel, Herr Freytag published "Bilder aus der deutschen Vergangenheit" (Sketches from the Past of Germany), the two first volumes of which, under the title "Mittelalter" (The Middle Ages), have reached a fifth edition. In the best of styles the author discusses in lively essays the principal episodes of German history, interwoven with miniature biographies of the more prominent historical characters of his fatherland. One of these masterly portraits, drawn in vivid colors, is that of Charlemagne, of whom Mr. Freytag tells the following novel anecdote, which he found in a Latin chronicle written by a monk at St. Gallen: Charlemagne had heard of the vanity and avarice of one of his bishops, whom he accordingly thought to humiliate. He therefore instructed a Jewish merchant, who used to bring many costly things from the Land of Promise, to gull the bishop, and the Jew, embalming an ordinary house-mouse, offered it for sale to the bishop as a very precious and unheard-of animal, which he had brought over from Judea. After some higgling, the bishop, who never gave anything to the poor, bought the great rarity from the Jew for more than twenty pounds of silver. This done, the Jew made his report to the emperor, who assembled his counsellors and bishops, warned them against avarice and vanity, and concluded: "One of you has given so much silver to a Jew for an embalmed house-mouse." The guilty party at once fell on his knees and begged pardon, which was readily granted. Mr. Freytag's book is full of interesting facts of a similar character, that shed much light on the habits and mode of life, the literature, and the influence of the Church of mediæval Germany.

MR. J. S. MILL'S LAST VOLUME OF DISSERTATIONS AND DISCUSSIONS.*

THIS volume contains eight of the shorter productions of Mr. Mill's pen published since 1859, including the recent inaugural address at St. Andrews. One has already appeared in pamphlet form, and the remainder in *Fraser's Magazine* and *The Edinburgh Review*. With the inaugural address and the articles on the "Contest in America" and on "Non-intervention" the American public is already familiar. The one on "Parliamentary Reform" and the review of "Some Recent Writers on Reform" appeared in 1859, when the reform movement in England of which we are now witnessing the consummation was just beginning, and it is in the highest degree interesting to read in the light of subsequent events Mr. Mill's estimate of it and of the course it would probably run. He called attention in 1859 to the small amount of excitement by which the new movement was marked, the small amount of interest which it seemed to create amongst the mass of people, although the leaders of all parties felt that "reform was a political necessity." As it turned out, however, this feeling on the part of the leaders of all parties did not bring reform about. Bill after bill was introduced during the ensuing seven years and all perished under the secret hostility of the House of Commons and the apathy of the public out of doors, and it is notorious that the present one has succeeded not without popular excitement, but under the pressure of popular excitement. In the article on "Some Recent Writers on Reform," Messrs. Austin, Lorimer, and Hare, whose works had then (1859) just appeared, Mr. Mill, too, congratulates the English public on the fact that the reform movement, besides being distinguished by the absence of popular discontent, "seemed likely to be still farther distinguished by the quality of the contributions made by individual thinkers towards a better understanding of the philosophical elements of the subject," and he speaks of the then demand for reform "as being in an unusual degree the product of calm reason." The bill which has actually passed, however, has been the product of political trickery combined with happy accidents, and we believe it would be impossible to point to a single section of it which has been the product of "calm reason," or on the framing of which the thinking of political philosophers has had much if any influence.

Of course however, this failure to anticipate the course of events detracts little if anything from the value of the two papers. A large portion of the points discussed in both of them are of interest rather to English than American readers. The elaborate argument against the ballot con-

* "Dissertations and Discussions, Political, Philosophical, and Historical. By John Stuart Mill." Vol. IV. Boston: William V. Spencer. 1867.

tained in the "Thoughts on Parliamentary Reform" derives, we are bound to say, little or no support from the actual working of this form of voting here. After carefully considering it, we are unable to recall a single piece of American experience that would fairly justify Mr. Mill's forebodings about it. His statement of his opinions regarding the propriety of a qualification for the franchise, coming from so able and ardent and effective a champion of universal suffrage as he has proved himself, is, however, of great value, and, although made eight years ago, he evidently finds nothing in it to change. He would give a vote to every adult, of both sexes, as he thinks every man and woman is entitled to exercise some influence on the government under which he or she lives, but he would not allow all to exercise the *same* influence on the government; and the passage in which he speaks his mind on this matter we cannot help quoting, particularly as we can think of no adequate reply to it, except that what he proposes is not practicable:

"The possession and the exercise of political, and among others of electoral, rights, is one of the chief instruments both of moral and of intellectual training for the popular mind; and all governments must be regarded as extremely imperfect until every one who is required to obey the laws has a voice, or the prospect of a voice, in their enactment and administration.

"But ought every one to have an *equal* voice? This is a totally different proposition, and, in my judgment, as palpably false as the other is true and important. Here it is that I part company, on the principle, with the democratic reformers. Agreeing with them in looking forward to universal suffrage as an ultimate aim, I altogether dissent from their advocacy of electoral districts, understood as a means of giving equal weight to the vote of every individual. They say that every one has an equal interest in being well governed, and that every one, therefore, has an equal claim to control over his own government. I might agree to this, if control over his own government were really the thing in question; but what I am asked to assent to is, that every individual has an equal claim to control over the government of other people. The power which the suffrage gives is not over himself alone, it is power over others also; whatever control the voter is enabled to exercise over his own concerns, he exercises the same degree of it over those of every one else.

"If it is asserted that all persons ought to be equal in every description of right recognized by society, I answer—not until all are equal in worth as human beings. It is the fact that one person is *not* as good as another; and it is reversing all the rules of rational conduct to attempt to raise a political fabric on a supposition which is at variance with fact. Putting aside for the present the consideration of moral worth, of which, though more important even than intellectual, it is not so easy to find an available test; a person who cannot read is not as good, for the purpose of human life, as one who can. A person who can read, but cannot write or calculate, is not as good as a person who can do both. A person who can read, write, and calculate, but who knows nothing of the properties of natural objects, or of other places and countries, or of the human beings who have lived before him, or of the ideas, opinions, and practices of his fellow-creatures generally, is not so good as a person who knows these things. A person who has not, either by reading or conversation, made himself acquainted with the wisest thoughts of the wisest men, and with the great examples of a beneficent and virtuous life, is not so good as one who is familiar with these. A person who has even filled himself with this various knowledge, but has not digested it—who could give no clear and coherent account of it, and has never exercised his own mind, or derived an original thought from his own observation, experience, or reasoning, is not so good, for any human purpose, as one who has. There is no one who, in any matter which concerns himself, would not rather have his affairs managed by a person of greater knowledge and intelligence than by one of less. There is none who, if he was obliged to confide his interest jointly to both, would not desire to give a more potential voice to the more educated and more cultivated of the two.

"The most direct mode of effecting this would be to establish plurality of votes in favor of those who could afford a reasonable presumption of superior knowledge and cultivation. If every ordinary unskilled laborer had one vote, a skilled laborer, whose occupation requires an exercised mind and a knowledge of some of the laws of external nature, ought to have two. A foreman or superintendent of labor, whose occupation requires something more of general culture, and some moral as well as intellectual qualities, should perhaps have three. A farmer, manufacturer, or trader, who requires a still larger range of ideas and knowledge, and the power of guiding and attending to a great number of various operations at once, should have three or four. A member of any profession requiring a long, accurate, and systematic mental cultivation—a lawyer, a physician or surgeon, a clergyman of any denomination, a literary man, an artist, a public functionary (or, at all events, a member of every intellectual profession at the threshold of which there is a satisfactory examination test) ought to have five or six. A graduate of any university, or a person freely elected a member of any learned society, is entitled to at least as many. A certificate of having passed through a complete course of instruction at any place of education publicly recognized as one where the higher branches of knowledge are taught, should confer a plurality of votes."

"Bain's Psychology" is an elaborate review of "The Senses and the Intellect," and the "Emotions and the Will," published by that author in 1855 and 1859, books which are now familiar to most students of philosophy. Mr. Bain is now the acknowledged head of the "Association Psychologists," who may be pronounced the most advanced section of the great *à posteriori* division of philosophers. Mr. Bain has gone one step—but it is a very important one—beyond his predecessors, in ascribing to the brain not only the power of receiving sensation, but spontaneous activity capable of originating movements without any impression from without, and thus putting the machinery of association, if we may call it so, in motion. Mr. Mill probably never appears to so much advantage as a writer as when he is engaged in the discussion of subjects of this class, as they are subjects for the discussion of which power of clear statement is as important as it is rare, and Mr. Mill possesses it in an almost unrivalled degree.

"The Contest in America," which appeared in 1862, when the fortunes of the North were at the lowest, is perhaps the ablest and noblest tribute to the righteousness of its cause which the struggle called forth on the other side of the water. It would be hard to find in the English language a finer specimen of argumentative indignation, or indignant argument, whichever we please to call it. Mr. Mill's style is, of all things, intellectual, and when it is suffused with the deep feeling, as in his political writings it sometimes but not often is, the result is apt to be a model of vigorous eloquence—that most vigorous of all kinds of eloquence in which every movement contains evidence of power held in restraint and disciplined. The following is now a famous passage, but it reads now better than when it was written (1862), and deserves remembering:

"For these reasons I cannot join with those who cry Peace! peace! I cannot wish that this war should not have been engaged in by the North, or that, being engaged in, it should be terminated in any conditions but such as would retain the whole of the territories as free soil. I am not blind to the possibility that it may require a long war to lower the arrogance and tame the aggressive ambition of the slave-owners to the point of either returning to the Union, or consenting to remain out of it with their present limits. But war, in a good cause, is not the greatest evil which a nation can suffer. War is an ugly thing, but not the ugliest of things; the decayed and degraded state of moral and patriotic feeling which thinks nothing *worth* a war, is worse. When a people are used as mere human instruments for firing cannon or thrusting bayonets in the service and for the selfish purposes of a master, such war degrades a people. A war to protect other human beings against tyrannical injustice; a war to give victory to their own ideas of right and good, and which is their own war, carried on for an honest purpose by their free choice, is often the means of their regeneration. A man who has nothing which he cares more about than he does about his personal safety is a miserable creature who has no chance of being free, unless made and kept so by the exertions of better men than himself. As long as justice and injustice have not terminated *their* ever-renewing fight for ascendancy in the affairs of mankind, human beings must be willing, when need is, to do battle for one against the other. I am far from saying that the present struggle, on the part of the Northern Americans, is wholly of this exalted character; that it has arrived at the stage of being altogether a war for justice, a war of principle. But there was from the beginning, and now is, a large infusion of that element in it; and this is increasing, will increase, and, if the war lasts, will in the end predominate. Should that time come, not only will the greatest enormity which still exists among mankind as an institution receive far earlier its *coup de grâce* than there has ever, until now, appeared any probability of; but in effecting this the free States will have raised themselves to that elevated position in the scale of morality and dignity which is derived from great sacrifices conscientiously made in a virtuous cause, and the sense of an inestimable benefit to all future ages brought about by their own voluntary efforts."

Perhaps the most interesting tribute in the volume is that on "Austin's Jurisprudence." Mr. Austin was one of the ablest men England has produced in the present century, and the second Englishman who could fairly lay claim to be considered a jurist in the large sense of the term—that is, a man who made a successful study of the philosophy of law. He was not, properly so called, a disciple of Bentham, as he worked a narrower field, and with much more effective tools as far as the world outside was concerned. Bentham occupied himself with the whole field of legislation, Austin only with the form which all bodies of law must take. Bentham's voluminousness, complexity of arrangement, combined with the extraordinary jargon which he invented for his own use, prevented the general public from ever knowing much about his labors, except in a few short papers of popular interest, such as the "Defence of Usury," which made him famous, and would have always prevented it, if his friend Dumont had not undertaken the herculean task of mining in his manuscripts and presenting some of the ore to the world in a portable shape, though in French. Austin died young, five or six years ago, leaving his "Lectures on Jurisprudence," which were a sequel to his "Province of Jurisprudence Determined," unfinished, and a large portion of the material presented to the public in his last volume consisted of memoranda and fragments. His lectures excited extraordinary interest in London at the time of their delivery, amongst the ablest men in England. The course was followed by the most distinguished, though not the most numerous, audience that any English lecturer has ever been able to get together. Had he lived, he would undoubtedly have founded what no community of the Anglo-Saxon race has yet produced—a school of legal philosophy. The appearance of Mr. Maine on the scene just as Mr. Austin was quitting it

proves, however, that the seed sown by the latter did not fall on stony ground, and that brilliant results in the same field of enquiry may still be looked for from English students. Mr. Mill's review is simply a résumé of what Mr. Austin accomplished. The only bit of criticism in it is his adherence as against Mr. Austin, and justly, it seems to us, to the classification of the body of law adopted by Bentham and James Mill—that is, of a law of rights and duties, and law of wrongs and remedies—Mr. Austin having followed the Roman classification somewhat closely, making his classification consist of two divisions of the law of rights, including under the latter what he calls "sanctioning rights," *i. e.* remedies, and "consequences of duties."

In the article on "Grote's Plato," which may be called the weightiest and most elaborate article in the collection, Mr. Mill has done for Mr. Grote what Mr. Grote himself has done for Plato, and he has displayed in it that happy faculty of explaining ancient life by illustrations drawn from the modern world, and of using the lesson of ancient life in the social philosophy of our own day, which has given Mr. Grote's labors so much of their charm and value.

FROM RUSSIA TO ICELAND.*

ONE can never be certain where Mr. Browne's humor will carry him when dealing with things which, being in one sense facts, may be styled sober realities; but the extent to which it will go when he lets it loose we were first made aware of by his present narrative. It is easy, when once forewarned, to allow for that habitual extreme exaggeration which is the characteristic quality of American humor. But it is difficult, for simple-minded and untravelled readers at least, to discern the true from the fantastic when both are bound up together, as here, in the closest connection. These excesses are not redeemed by an unusual amount of moralization—unusual for our author. The combined effect is of alternate exaltation and depression, quite incompatible with the steadiness of a guide. Mr. Browne's intention is to amuse, but as he is capable of instructing also, it is a pity he should sacrifice to the more doubtful aim the nobler one—the one at any rate which, as a traveller telling us of strange lands, it would seem that he ought to have kept in view. The chapters on the "nose regiment" and on the "mysterious adventure" would justly shake dependence on statements quite trustworthy, such as the descriptions of the Moscow and St. Petersburg Railroad—which, by the way, has just passed into private hands—of the country between the two capitals, of the public and private buildings in Moscow, of the bear-hunts of the court and nobles, of the customs and traits of the people, etc., etc.

As may be inferred, the author did not directly visit "the land of Thor." A few weeks previously spent in Russia, in the cities just named, gave him material for half his book, but of course gave him opportunity for only the most superficial observations. Of interior and domestic life he saw almost nothing; of green roofs and gilded domes a great deal; and of the people in the streets he saw enough to make him partial to their native disposition, and to make him prefer the unobtrusive, if despotic, regimen of the Czar to the police systems of France and Germany, which incessantly recall the absence of liberty. Emancipation of the serfs was not yet consummated, and Mr. Browne is at pains to instruct Alexander in his duty, evidently fearing, however, that his remonstrances will not be heeded. He perhaps has a better opinion of Alexander now, and brighter hopes of Russia; and he probably would not have written, though he has printed, after Sadowa: "The states of Germany—what future have they?"—implying, of course, that they have no "future," or a very melancholy one.

From the Volga to the Arctic Circle, which is the range of these covers, the spectacle of a drunken man, the smell of whiskey and tobacco, the opportunities for dispensing with spittoons, throw the author into what must be thought indecent ecstacies, and invariably remind him of America, of home, of California. Mr. Browne has undoubtedly a genuine affection for the Pacific Coast, but he has an odd way of showing it. The climate and the scenery of California he often compares favorably with those about him; its people only as viewed from the side of its vices, or rather of the vices of its worst and no longer representative class. The taste and wit of these truly odious comparisons, repeated *ad nauseam*, are therefore exceedingly questionable, even when they provoke a smile. A foreigner who should chance upon this book, or indeed upon any other by the same writer with which we are acquainted, would certainly derive from it a very erroneous impression of California manners, as, to let one example answer for a score, from this passage (p. 188):

"There was something really homelike in a reeling, staggering crowd—their shouts and uproarious songs, their boozy faces and tobacco-stained mouths. Everybody seemed to be on a regular 'bender.' The only point of difference between the Swedish and the California 'bender' was in the way the boys hugged and kissed the peasant girls; but even in this respect," etc.

In Sweden, Norway, Denmark, and Iceland—the true land of Thor, in short—Mr. Browne restrains himself, and tells in a generally unobjectionable way a good deal that is useful to know about those countries. It is pleasant, for one thing, to have in the same book descriptions, more or less minute, of Stockholm, Copenhagen, and St. Petersburg—the Venices of the North. In Scandinavia, too, and in Iceland, we are no longer confined to views from the outside, but are favored with gratifying accounts of peasant hospitality in circumstances the most trying to host and guest. The horrors of the "best chamber," it appears, are not peculiar to the country houses of New England and the West. When we have added that the chapters on Iceland are rendered more valuable by the illustrations—some, not all—we have said more than we care to assert of the remainder. The sketches of landscape in that volcanic island suggest great possibilities for the artist resolute enough to encounter the drawbacks of rough roads, bogs, fords, and uneven weather.

The following description has sufficient interest, we hope, to excuse the style:

"Before me stood the tall, thin, shambling, raw-boned figure of a man a little beyond the prime of life, but not yet old, with a pair of dancing gray eyes and a hatchet-face, all alive with twists and wrinkles and muscles; a long, lean face, upon which stood out prominently a great nose, diverted by a freak of nature a little to one side and flanked by a tremendous pair of cheek-bones, with great hollows underneath. Innumerable ridges and furrows swept semicircularly downward around the corners of a great mouth—a broad, deep, rugged fissure across the face, that might have been mistaken for the dreadful child-trap of an ogre but for the sunny beams of benevolence that lurked around the lips, and the genial humanity that glimmered from every nook and turn. Neither moustache nor beard obscured the strong individuality of this remarkable face, which for the most part was of a dull granite color, a little mixed with limestone, and spotted with patches of porphyry. A dented gutta-percha forehead, very prominent about the brows, and somewhat resembling in its general topography a raised map of Switzerland, sloped upward and backward to the top of the head; not a very large head, but wonderfully bumped and battered by the operations of the brain, and partially covered by a mop of dark wavy hair, a little thin in front and somewhat grizzled behind; a long, bony pair of arms, with long hands on them; a long, lank body, with a long black coat on it; a long, loose pair of legs, with long boots on the feet, all in motion at the same time, all shining and wriggling and working with an indescribable vitality; a voice bubbling up from the vast depths below with cheery, spasmodic, and unintelligible words of welcome—this was the wonderful man that stood before me, the great Danish improvisator, the lover of little children . . . . . this was no other, and could be no other, than Hans Christian Andersen."

THE AMERICAN ORIENTAL SOCIETY.*

WHAT sensations Dr. Bigelow would experience at the sight of these learned volumes, and a knowledge of the aim and purpose of the society which published them, can be faintly imagined by those who have read his indignant protest against the turpitude of Homer and the futilities of the dual number and the middle voice. That a couple of hundred respectable gentlemen, most of them wearing black broadcloth and advanced in life, should deliberately set to work to cultivate and extend the knowledge of the "Asiatic, African, and Polynesian languages"—should import Chinese type, and print in Sanscrit the "Atharva-Veda-Prâtiçâkhya," with a commentary for the information of the enlightened Yankee nation—must be a thought so painful to every admirer of steam-engines and sewing-machines, that we doubt if the fact has been accepted in all its blank enormity. Even Dr. Bigelow allows that there may be some advantage derived from the study of Greek, in spite of the horrors of the middle voice and the second aorist—but what possible benefit can accrue from the Drawidian dialect, or the barbarous vocabularies of Tamil and Telugu? Nevertheless, it is our sad duty to record the fact that, though still "we have a Pacific Railroad to be built and a nation to be reconstructed," there are misguided scholars in the United States who will persist in reading Persian and Japanese, and will even prepare grammars of the Isizulu and the Micronesian languages.

The originators of the American Oriental Society seem to have been certain learned and pious men in Boston, Andover, New Haven, and New York who shared in the general revival of Oriental studies within this century, and who had the additional incentive of a strong interest in foreign missions. It is well known how modern is the whole subject of comparative philology, and how much has been done to develop it by the researches of missionaries and magistrates in the East. Before the time of Sir William Jones and Warren Hastings, the Jesuits in India and China had given much information respecting the literature of those countries; but since the occupation of India by the English, and the establishment of

* "The Land of Thor. By J. Ross Browne. Illustrated by the Author." New York: Harper & Brothers. 1867.

* "Journal of the American Oriental Society. Volumes I.-VIII." New Haven: E. Hayes; New York: B. Westermann & Co.

our American Board of Foreign Missions, more recently, the work of investigation has gone on very rapidly. And yet it is amusing to notice how ignorant many eminent men have been on Oriental topics. The great Sir William Jones complained of a Chinese dictionary that it did not contain the letters A and B—the former letter being never used as initial, and the latter never used at all in Chinese words; and even so late as 1827, the celebrated but superficial Dugald Stewart spoke of the Sanscrit as a jargon made up from Greek and Latin. The Asiatic Society of Paris was not founded until 1822, under the direction of De Sacy, Remusat, and other famous Orientalists. Twenty years later, Dr. Jenks, Dr. John Pickering, Professor Stuart, Dr. Edward Robinson, and others established the American Oriental Society, which was incorporated by the Massachusetts Legislature in 1843. Its first president was Dr. Pickering, whose address, delivered in May, 1843, gives a good summary of the then existing condition of Oriental scholarship in this country, in England, and on the Continent. Dr. Pickering died in 1846, two years after his old friend Peter Du Ponceau (who also was one of the original members of the society), and was succeeded as president by Professor Robinson. About the same time the office of corresponding secretary was accepted by Professor Edward E. Salisbury, of Yale College, whose labors for a succession of years were sufficient to build up the society and to make New Haven as much its home as Boston had been. At the present time Dr. Woolsey, president of Yale College, is president of the society, its fine library is in New Haven, its corresponding secretary, Professor W. D. Whitney, resides there, and several of its most active members are connected with Yale College. The number of corporate members is now nearly two hundred, of corresponding members nearly a hundred, and there are about thirty honorary members. Among the past and present members in this country we find the names (besides those given above) of the two Everetts, Edward and Alexander; R. W. Emerson, W. C. Bryant, Bayard Taylor, Theodore Parker, Noah Webster, Joseph E. Worcester, Dr. Peter Parker, Dr. F. L. Hawks, Dr. Charles Pickering, C. L. Brace, and Caleb Cushing; in foreign countries, Alexander von Humboldt, Richard Lepsius, Julius Mohl, Stanislas Julien, Ernest Renan, Franz Bopp, Sir Gardiner Wilkinson, and Sir John Bowring. And though it could hardly be expected that all the members should take an active part in the discussions and correspondence of the society, yet the extent to which this has been done shows the interest felt by the great majority in the special work undertaken.

But what is this work? It is perhaps imagined by some that to be a member of the Oriental Society it is necessary to read at least one "Asiatic, African, or Polynesian language," and to be able to discuss topics in Arabic, Sanscrit, Chinese, or Persian literature. No doubt this would be desirable, but it is not expected of all those elected to membership. Nor, on the other hand, are the only requisites, as a witty outsider once said, "to live down East, and have five dollars in your pocket." It seems to be expected of the members that they shall first of all take an interest in learning, and particularly in that branch of learning which deals with the languages, history, institutions, and civilization of nations, remote either in space or time. Ethnology is, perhaps, the best single term to denote this class of topics; and this is a science which may be studied and promoted by merchants, travellers, missionaries, sailors, and observers of all kinds, as well as by professed scholars. It is the ethnology of the East that the American Oriental Society specially considers; but in doing this there is a place for those who are familiar only with Latin and Greek among foreign tongues, or who are confined strictly to the vernacular.

"We call upon the enlightened and cultivated in our community," said the directors, in 1858, "to come forward in aid of the society. We rely especially upon classical scholars, and professors of philology, philosophy, and the historical sciences in our colleges. We rely also upon general students of history, literature, and art. We rely upon those who are interested for the character and reputation of American scholarship. We rely upon the friends of missions and of the missionaries. We rely upon American merchants who have been successfully engaged in Eastern commerce, assured that they feel more than a merely commercial interest in the East. The society is an association not of Oriental scholars only, but for the promotion of Oriental science."

In the quarter of a century that has passed since the humble beginnings of this association, it has done much to justify the hopes with which it was founded. It has collected a library containing thousands of volumes and hundreds of manuscripts, most of them rare, some unique, and all of value to the student. It has published four or five thousand pages of curious and learned research, which has added largely to the knowledge of mankind. It has served as a means of communication between scholars in all parts of the world, and has aided their private studies by information, sympathy, and encouragement. It has not produced a patent churn or an improvement in steam-engines or cotton machinery, but it has done something to open to Western commerce and to Western ideas the wealthy and populous empires of China and Japan. At the last annual meeting, held in Boston on the 22d of May, it was stated that the Chinese government are about establishing schools in which the sciences of Europe, and, in particular, the Baconian philosophy (to which it is fashionable to ascribe much potency in modern civilization), are to be taught to Chinese youth; and in these schools we find members of our own Oriental Society employed as teachers.

There has been, however, a serious defect in the administration of this society. It has not allowed, or at least has not sought, that publicity which the value of its labors deserved. For this reason, little is known of it outside of the circle of members. It is much to be desired that the directors should cause to be published, in newspapers and magazines, the principal transactions and the most important information of the society. In this way it would reach thousands of readers who now never see the volumes of the "Journal," and it would stimulate researches as well as satisfy curiosity. We commend this suggestion earnestly to the attention of the society, being confident that, if acted upon, it will greatly enlarge the usefulness of their organization.

JANNEY'S HISTORY OF FRIENDS.*

THE work before us, of which the first two volumes were published in 1859, opens with a statement of the more prominent "testimonies" of the early Friends, which is succeeded by a very cursory sketch of the history of the Christian Church to the time of George Fox. Then follows a record of the experiences of that remarkable man, who for many years was a veritable apostle of the truth, a particular statement of the persecutions to which he and his followers were exposed from magistrates, priests, and people, and all other noteworthy matters relating to the society until the separation, which took place in America about the year 1828, the circumstances preceding and attending which are very fully detailed in the latter half of the fourth volume. The bulk of the work consists of more or less minute memorials of a very large number of ministers and other prominent men and women, the reading of which, it must be confessed, is sometimes a monotonous employment; but the monotony is frequently relieved, especially in the earlier part, by incidents of an heroic or sadly tragic character. The records from which the author was able to draw the material for the construction of his history were ample, perhaps more full and complete than those which have been preserved by any other sectarian body.

It is remarkable that those most actively engaged in organizing the Society of Friends were young men and young women, few being thirty years of age at the commencement of their ministry, and some not more than eighteen or twenty. George Fox himself was about twenty-three years old when he began to preach in 1647. All the more noble, therefore, is the story of their constancy under the severest trials of their faith, and it would awaken much wonder in us had we not learned in the school of experience that the little trials of this life are even harder to bear than the large ones, and that there is in every great cause an inspiration adequate to the making of martyrs. The society rapidly took form and gained adherents. The period was one of much theological as well as political activity, and there seems to have been a large class of persons denominated "seekers" who were very ready to join such a movement as this. The "testimonies" of the new Protestants brought them of necessity into collision with those in authority in such troublesome times, and imprisonment in noisome dungeons, the stocks, and many stripes were the aliment upon which they thrived for many years. To those holding the supreme power in the state they spoke boldly, and they do not seem to have been treated by them with especial discourtesy. It is perhaps an open question whether Cromwell did not intend to be somewhat facetious when, at the close of a conversation with George Fox, he said to the leather-clad apostle, "Come again to my house; for, if thou and I were but an hour of a day together, we should be nearer one to the other."

After about the year 1720, when their persecution had in great measure ceased, the society seems to have grown much more slowly than before. The narrative becomes less interesting to the outside reader, excepting when it touches, as it necessarily often does, upon the connection of the society or of its members with the great social questions of the day. The evils of slavery and the slave-trade engaged the attention of this people almost simultaneously with their settlement in America, but with characteristic slowness, though with equally characteristic pertinacity, the question was dealt with and argued upon for eighty years before total abstinence from

* "History of the Religious Society of Friends, from its rise to the year 1828. Vols. I.–IV. By Samuel M. Janney." Philadelphia: T. Ellwood Zell.

all connection with the institution was required of the members. In the anti-slavery agitation of the past thirty years the Quaker "testimony," renewed and vitalized by the Motts, the Hoppers, and others less famous but equally faithful, contributed powerfully to the great overthrow which could not come through peace. Against intemperance also the Friends have labored efficiently, for the promotion of education, for a juster system of prison discipline, and for many other humane objects. Their treatment of the Indian tribes in this country gains lustre from the unhappy occurrences of the present hour.

If the author, himself a Friend and a schismatic, had taken too favorable a view of the position both of the society and the branch to which he belongs, it would not have been surprising, and it is probable that the record has been colored to some extent in this way. Yet there is an evident intention to write with judicial fairness; for instance, after detailing the infamous persecutions to which Friends were subjected in New England, particularly in Massachusetts, he says: "Although a regard for historical accuracy requires an impartial account of the severe persecutions endured by the early Friends in New England, the narrative cannot be continued without reluctance; especially when we reflect that among no people on earth is religious liberty, in this age, more highly appreciated or more fully secured than by the descendants of the Pilgrims." And, further, after giving an account of the execution of certain Friends on Boston Common: "There can be but one opinion among all reflecting minds concerning the bloody tragedy enacted at Boston; it should be remembered, however, that a large proportion of the colonists were opposed to the course pursued, and the infamy must rest upon a few who were enabled, by the ecclesiastical features of their government, to hold the reins of power."

In treating of the great separation—a difficult task—we should say that Mr. Janney has endeavored conscientiously to do justice to both parties, and, it seems to us, with a considerable degree of success. Belonging as he does to the branch called "Hicksite," to distinguish it from the "Orthodox' Friends, it is to be expected that the latter will not accept his narrative as a truthful account of the event, its causes, and the principles involved; at the same time, it must be borne in mind that the feeling of bitterness subsisting even yet between the two branches, especially on the part of the Orthodox, is such as ill comports with their peaceful and forgiving faith, and prevents that fair and equitable judgment which is to be desired. Mr. Janney frankly acknowledges, what we think must appear to any unprejudiced reader, that in regard to belief both parties had somewhat diverged, and that in opposite directions, from the position held by George Fox and his more prominent converts. Yet the belief of these earlier Friends was not uniform, and in this connection our author well says: "An attempt to enforce entire uniformity of belief was the rock upon which the Protestant reformers split, and which the early Friends had the wisdom to avoid. In the days of George Fox they were remarkably tolerant; but in succeeding times, as the bond of Christian love grew weaker, a greater reliance upon rules of discipline became manifest."

The work is much of it written in a plain, simple, unpretending style, but abounds in some parts in that peculiar stilted Scriptural phraseology with which those who have often attended Friends' meetings or read Friends' books are thoroughly familiar. Sewell's "History of Quakers" has the advantage of the direct personal knowledge and connection of its author with many of the events which he details, it having been written between 1700 and 1720, and is attractive on account of a certain quaintness of style, but it covers a period of only about seventy years. There are other histories, but none, we believe, so comprehensive as that now offered to the public. We commend it to the reading of persons of all sects, and not least to the young, for an insight into spiritual purity and fidelity to the inner light such as are not likely to be exhibited again, certainly not in our day, in the formation of a new society. The Quaker forms and organization are perhaps declining, and may, in a few generations, become extinct. Even more on this account is their history worth studying, and their decadence may serve even more distinctly than their rise to point out the foundations of the "broad church" of the future.

Co-operative Stores. Their History, Organization, and Management. Based on the recent work of Eugene Richter, with annotations and amendments rendering the work specially adapted for use in the U. S. (New York: Leypoldt & Holt. 1867.)—We have carefully compared this translation with the original, and though it bears marks of the haste in which it was executed for the press, we find it on the whole a creditable piece of workmanship. We may say more than that. It is easier to translate a play of Lessing's or of Schiller's than some of these chapters, full of technical business terms, and full of new words to which the dictionaries, made before the day of the great co-operative movement, hardly afford a clue. In several instances we have noticed difficulties of these sorts which have been very skilfully overcome in the rendering. It remains to hope that this volume, accessible to all from its cheapness, and undoubtedly the most practical of its kind in the English language, will be widely purchased by the working classes, and will encourage them to establish societies and stores for mutual help. The sixth chapter is one of the most important, because it deals with the question of sales, as between making them general to the public or confining them to members. We do not say it would be regrettable if the latter course should prove the more popular in this country, but we think that in the former lies the germ of the great moral advantages obtainable through co-operation. It is, of course, something that men of small earnings should get the necessaries of life at a considerable discount, and it is worth while to combine for this, and this only; but we honor those who are content to fund this discount before touching it, and who connect with the object of cheap living that of social and intellectual improvement, and who make the store only the basement to the library and the lecture-room, and a means to purer homes and happier domestic relations. If there is any doubt—and the author presents all sides very fairly—we advise that the benefit of it be given rather to the English than the German example, on the principle that the former is likely to be better adapted to our national conditions and character than the latter. In conclusion, let us reproduce here the table of contents:

I. History of Co-operative Stores in England; II. Nature and Object of Co-operative Stores in England; III. Formation of Co-operative Stores in Germany; IV. Nature and Object of Co-operative Store Societies in Germany; How to start a Co-operative Store; Constitution and Laws of Co-operative Store Societies; VII. Different kinds of Business, and their Peculiarities; VIII. Establishment of Business and Accumulation of Capital; IX. Purchase of Goods; X. Sale of the Goods; XI. Book-keeping in Co-operative Stores; XII. General Hints for Management of Business; Index.

Recent Republications.—The lives and the heroic death of noble men having instruction for all the world, and being too seldom told without prejudice or without undue exaggeration, it is a solid service to the public which Mr. Higginson, seconded by his publishers, Messrs. Sever & Francis, Cambridge, has done in preparing a second edition of the "Harvard Memorial Biographies." The mechanical part of this edition, indeed, is wholly new, and the literary has doubtless been improved by corrections which the editor solicited in March last. In one instance we notice a biography of the average fulness substituted for one purely temporary, and therefore too brief, in the first edition. The list of obituary works at the end is also more complete, and just allusion is made by name to some of the Harvard dead whose courage and devotion and self-sacrifice during the war—everything but military enlistment, or death as an immediate or evident result of army experience—would have entitled them to a place in this record, and some day on the stone tablets of the college whenever erected. In short, except for a well-proportioned shrinking in dimensions of page and margin and type, the present edition is more desirable than the former, being as carefully printed and as neatly bound. Its price is too moderate for profit as it is for the real value of the contents, which include, we must not forget to say, Mr. Lowell's lofty commemorative ode.

Messrs. George Routledge & Sons' cheap edition of Bulwer's works, of which the sample before us is "The Last of the Barons," is sold at a price that puts the volumes within the reach of everybody. It appears in stiff paper covers, the print is of course fine, the paper is pretty strong, and the edition generally—though it will not be purchased by those who care to have only good-looking books on their shelves; for that class of readers Lippincott's more expensive "Globe Edition" is better—is yet to be commended to the attention of the many people with a strong appetite for novel reading who want to have at hand all the famous novels, but whose purses, like the purses of most novel readers—and other people—are not burdensome in size and weight.

The New York, Boston, and Philadelphia editions of Dickens's works are issued punctually according to the programmes of their respective publishers. Between them all a complete set could already be made, of course at the expense of uniformity. Each, as we have heretofore shown, has its peculiar claims and its peculiar admirers. Last week yet another—the "Charles Dickens edition" of Messrs. Ticknor & Fields—appeared, and up to this time we have seen none better and none so good. It is not meant for the pocket, but is of fair, well-proportioned dimensions, and is distinguished by its blue cloth covers, stamped with the autograph of the author. The full page is employed, without columns or dividing rules, and the print, though, small is not tryingly small.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

THE END AT LAST.

We presume the work of reconstruction, so far as Congress has to do with it, is now over. This time there is no mistake about the meaning of the Reconstruction bill. The military commanders are fairly installed in possession of the supreme authority in the districts assigned to them, and the President is more powerless than ever he was, for he has fired the last arrow in his quiver. He has said, it is true, that he will never "willingly execute" the law—a speech which threw Mr. Boutwell into a state of great excitement and made him call more solemnly than ever for impeachment; but then if presidents were to be tried and deposed for not executing laws "willingly," we fear hardly any president would reach the end of his term, because at least one law is passed in every term which the "chief magistrate" would rather not enforce. The mass of the public, we think, will be perfectly satisfied if he executes the law at all, and has given up caring greatly what his state of mind is. His last two communications to Congress, particularly the one in which he suggests the possibility of Congress having to assume the whole debt of the Southern States as the legal consequence of its interference with the work of reconstruction, were too foolish to make it worth anybody's while ever again to follow the course of his thought with either interest or anxiety. As long as he seemed a bold and desperate man, as he undoubtedly did when he first began the game of vituperation in the spring of 1866, his manner of looking at public questions naturally was of considerable importance. But the course which Congress has ever since pursued has so cooled his courage that we really believe him to be at this moment one of the most inoffensive men in public life. As a general rule, when a president announces that he means "to take the Constitution for his guide," as Mr. Johnson has so frequently done of late, he means that he intends to pursue a perfectly harmless career. The South, too, has by this time given up depending on him. No doubt there was a good deal of mischief done at first by his exposition of his views, but the extent of his powers is now known to everybody, and whatever hates or hopes Southern men may cherish they certainly have ceased to rely on Andrew Johnson for the means of gratifying them.

We have no doubt impeachment is by this time an unpleasant subject to a large and respectable body of members in both houses of Congress. Indeed, we know from Mr. Stevens himself that he, at least, wishes he never were to hear it spoken of again, and we feel sure that many other members are equally sensitive. We therefore refer to it with considerable reluctance, and without the least desire or intention of wounding any gentleman's feelings. But we owe it to ourselves and to the public to mention that the affair has ended very much as we expected it would end—in rather ridiculous failure. The longer the investigation lasted, the louder were the promises of the impeachers and the smaller their performance. The committee has quarrelled a good deal, and indulged in much open recrimination; but in spite of their quarrelling none of their "startling revelations" have ever reached the public. We venture to repeat the assertion which we have already several times made, that the public knows now as bad things of the President as any member of the committee knows, and that the efforts of the minority have for the last six months been directed simply to making up in bulk of evidence for what was lacking in quality. When this movement was first started, nearly a year ago, we attempted to show why it ought not to succeed, and we prophesied that it would not meet with any popular favor, although at that time the country was seething with excitement and the penalties of differing from Messrs. Stevens and Boutwell on any public question were heavier than they are now. We have never since then abated one jot of our confidence in the popular good sense with regard to it, in spite of many vigorous remonstrances from excitable subscribers, and the result has fully justified us. So, too, when, shortly after The Nation was started, we ventured to controvert the theory which was set afloat in Massachusetts, that the Supreme Court could be got to establish negro suffrage by declaring all governments to be non-republican which made electoral discriminations based on color, we incurred some obloquy for taking such a cold, heartless view of the powers of the court in opposition to such weighty authorities as Messrs. Boutwell and Sumner, and we forget how many others of like respectability. We were not shaken, however, and we have lived to see this same court decide against Mr. Boutwell's whole plan of reconstruction, and see him denouncing it with his usual fervor and threatening it with abolition for its perverseness. We have not the slightest doubt that the confiscation scheme will meet with the same fate as the impeachment scheme. The knowledge of history and of legislative science may not be very widely diffused amongst the American people, but the sound common sense, the feelings, hopes, and sympathies out of which the lessons of history and the principles of legislative science are drawn, pervade all classes and conditions, and any writer or speaker who holds to these lessons and principles firmly may feel right well assured that even if his path should temporarily diverge from the popular path, he will not fail to come out in the end in the same place.

Speaker Colfax told the story of reconstruction to the crowd under his window on Saturday night, in Washington, in fewer words and with more force and effect than we have ever seen it told, and it is a story which does infinite credit both to Congress and to the people. The process has now lasted two years; it has been marked by much foolish speaking, no doubt, and much waste of time, but we doubt if it would be possible to point to a legislative process in any age or country of equal intricacy and gravity which has been marked by so few mistakes. The essential facts of the case were, when the war closed, little known; they were infinite in number and variety, and they had been complicated by Mr. Johnson's premature and unwarrantable interference. Every step taken, therefore, at the outset, had to be tentative. Nothing positive was done till the South had fairly recovered its self-possession, and had revealed its real spirit. This spirit was then met by a minimum of coercive legislation. The Freedmen's Bureau act and the Civil Rights act were the least that could be done, if anything was done at all, to secure to the negroes not political rights, properly so called, be it remembered, but the common rights of humanity, and the Southern States were offered, in the Constitutional Amendment, conditions of restoration in which the North exacted nothing whatever as a victor in a bloody struggle. It simply asked the South to adapt its political organization to the alterations in its social organization. The South, acting under the advice of Northern Democratic politicians—perhaps the shallowest politicians which any country or age has ever produced—refused this offer with much bombast and rant. A whole year was then taken for the next step, and this next step was to arrange machinery for bringing the South into the Union *nolens volens*, not as a slave or a vassal, but with every form and guarantee, right and privilege, which has ever been found in, or suggested for, a free government.

Affliction and disappointment have, beyond a doubt, reconciled the Southern whites to their fate, and this time the revolted States will qualify for readmission, and will be readmitted. The duty of the Northern people in the meantime is clear. They ought, in the first place, to embody in their own legislation the principles they are forcing on the acceptance of the South; in the next place, bear with patience and good temper any capers which Southern politicians may be pleased to cut while coming back to their old places; in the third place, devote themselves strenuously during the next ten years to the work of education. If the experiment of freedom and equality should not end well in the South, it is ignorance that will cause its failure. What the blacks as well as the whites need is not land but light, and this no expense or labor ought to be spared to supply, and the more demagogues rave and rant, the more car-loads of teachers and books we ought to send off. Every time Governor Perry makes a speech, a dozen fresh schools ought to be opened with Northern money. Every time Wendell Phillips calls for forty acres of land and a nomination for the Vice-Presidency for every black head of a house, a ton of school-books, besides periodicals, ought to be ordered and despatched. Of this work we cannot do too much; and in it we cannot waste or go astray.

THE MEXICAN SENSATION IN EUROPE.

The great topic occupying the attention of the public in England and on the Continent during the last two or three weeks has been the death of Maximilian. Judging from the language of the press, and of "good society," we should be driven to the conclusion that the execution of a man taken in arms against an established government had never been heard of before, if we did not know that most of the sympathy expressed for Maximilian was poured out, not on a good man who had come to an untimely end, but on a European gentleman of ancient lineage who had been slain by Mexicans and half-breeds. The argument of the London *Times* that the atrocity of killing him lay in the fact that the fighting was over, and no further danger was to be apprehended from him, applied with equal force to the case of Governor Eyre, by whose permission or with whose connivance a thousand persons, men and women, were tortured or executed in Jamaica, not after the fighting was over, for there never had been any fighting, but after every symptom of disorder had disappeared. As far as mere inhumanity is concerned, Mr. Eyre is a far more execrable person than Juarez, and yet Mr. Eyre's cause has been taken up by almost the entire upper class in England, by her leading poet and one of her leading philosophers; his wife has been presented with testimonial jewellery by a large body of the choicest women of the choicest circles; he has been received at court and is enjoying a very comfortable and honored existence, although the Lord Chief-Justice, in spite of his remarkable command of language, acknowledged that he found some difficulty in expressing his sense of the atrocity and illegality of the governor's performances during the latter days of his administration. Mr. Eyre's friends acknowledge, it is true, that he indulged in unnecessary severity, but they excuse him on the ground that *he* thought it was necessary—an excuse which can be put forward with equal force for Juarez. What a man thinks, we can only infer from his acts and speeches; and judging from these, there is as little reason to suspect the sincerity of Juarez's convictions as that of those of Governor Eyre.

It thus appears that the question of the morality or immorality of killing a political adventurer or malcontent under martial law turns, in European eyes, not so much on the nature of the process or of the crime as on the social position of the victim. An officer may, under the influence of a panic or from mere cruelty of temper, kill negroes or peasants or such like, after the killing of anybody at all has, in the eyes of all calm lookers-on, become totally useless; but if he kills a prince under similar circumstances he exposes himself to the execration of mankind, and all civilized countries are bound to break off all intercourse with the government which employs him. A more startling and discreditable illustration of the shifting basis on which the notions of political morality rest in many of the most highly civilized countries of the world has hardly ever been afforded than is afforded by these two cases of Eyre and Maximilian, and luckily they have occurred in sufficiently close juxtaposition to make their resemblance very striking.

We observe that a good deal of stress is laid by a portion of the London press on the condemnation passed on Maximilian's execution by the larger and better portion of the public in this country. But it would be a pity to allow Europeans to suppose that American opinion has been in any degree affected by a comparison of the social value of Maximilian with that of Juarez, or that people here have been in any way moved to pity or indignation by the fact that Maximilian was a better born man or was of a more "exalted rank" than his executioner. There are people amongst us—and the celebrated Mr. Chandler, of Michigan, is one—who do think or seem to think that a prince caught filibustering is entitled to less mercy than other men, and that there is something peculiarly fine and heroic and democratic in shooting an aristocrat, and that this is a good way of spreading republican ideas through the world. But the number of these is exceedingly small. Those amongst us who approve of the act do so because they would approve of the shooting of any man under similar circumstances, because they believe it to have been necessary to prevent a repetition of such ventures as that in which Maximilian had been engaged. Those who disapproved of it, amongst whom we count ourselves, did so because they felt it would bring great discredit on the republican cause; because they thought it indicated the continuance of that ferocity of temper which disgraces Mexican political contests, and the disappearance of which will be the first and only sure sign that the country has entered on a process of regeneration; and because they felt that Maximilian's death was unnecessary, and that, being unnecessary, there were in the circumstances under which he ascended the throne and in his character and antecedents abundant reasons for treating him with indulgence. He enjoyed the extraordinary distinction of being a humane and liberal Hapsburg, of having filled many places of responsibility under the worst government in Europe not with credit only, but with great benefit to all who came under his influence or control; and there is nothing in the code of international morality as it now exists to make his attempt, under all the circumstances, to reign over Mexico a necessary indication that he was either unusually selfish or cruel or ambitious. In fact, his death and the performances in which the Mexican leaders have been indulging since his death, furnish, absurd as it may seem, a better justification of his attempt than anything in his life, because they go to show that whatever his faults may have been he was a civilized man trying to reign over barbarians. To be killed by such a political antagonist as Escobedo, and in order to make way for such a *régime* as is now established in Mexico, would entitle a far worse man than Maximilian to some of the honors of martyrdom in the eyes of a vast number of good people who thought his coming to Mexico wholly wrong.

THE BENCH AND THE BAR.

The North American Review for July contains an article exposing some of the corruptions and abuses which disgrace the administration of justice in the city of New York, the truth of which will not be questioned by any one at all familiar with the facts. It declares that many of the judicial officers of this city are in the habit of using their position for purposes of indirect and unwarrantable profit, that some of them take and indeed *extort* direct bribes, and that most of them are incompetent to fill properly the stations which they hold.

We are in possession of information of the most explicit kind, and upon the best authority, which confirms some of the gravest charges thus made, and demonstrates to our satisfaction, as it would to the satisfaction of the public, the personal corruption of some of the judges; but the details having been given to us in confidence, we are not at present free to publish them. It ought not to be necessary to do so, and if the friends of the parties implicated are wise they will withdraw their opposition to a change in the system which has made such things possible, without compelling the advocates of reform to spread before the world facts with which many lawyers are already familiar, but which are only vaguely suspected by the community at large.

Leaving *The Review*, however, to deal with the judiciary for the present, we desire to call attention to the condition of the bar, as a branch of the general question upon which the reviewer has but lightly touched. It could not reasonably be supposed that the bench might be degraded without dragging the bar down with it. There are no legal restraints, and few moral ones, upon the practice of the law other than such as are imposed by the discretion and moral sense of the judges. It is not to be expected that any very stringent restraint can be put upon bad lawyers by judges who are conscious that they neither have nor deserve the respect of the public themselves.

Accordingly, it has happened that a large and ever-increasing tide of young men have been pouring into the profession of law in this city, with very little evidence as to their abilities or character; while many of the older members of the bar have fallen into habits entirely inconsistent with the high character which such a profession ought to maintain. With regard to the bar, as with regard to a great many other things, the great cities are in an exceptional condition. In small towns and country districts the necessity for rigid, or, in fact, any rules of admission, is not very apparent to the ordinary mind. Of course it could be easily shown that the most important of political and social considerations is that justice should be well administered, and that justice cannot be well administered unless the judges are aided by enlightened, honest, and well-trained advocates. But then, throughout the country generally, every man's moral character as well

as his professional competency becomes very soon well known to his neighbors, and the bar, like everything else, is, if the bench be in a fair condition, kept tolerably pure and fairly learned by public opinion. Knavish or ignorant lawyers cannot thrive in a small community, and the country bar is thus sifted by the clients themselves, perhaps even more thoroughly than it could be by any legal machinery. But in the large cities no such check on knavery or ignorance exists. Nobody but the leaders of the profession are known to the general public. Below them there may be, and there is, a vast swarm of lawyers of whom nobody, except their unfortunate clients, knows anything, and who literally live by lying in wait for the unwary; and in a place like New York the unwary are so numerous, and the general indifference of each person to all concerns but his own is so great, that it is possible for a dishonest or incompetent lawyer to pursue a career of dishonesty and blundering for a lifetime without having his fame as a cheat or blockhead spread abroad.

The government in most civilized countries undertakes to guarantee that members of the bar shall have a certain degree of knowledge and a fair moral character; and in most European countries, even in England, where the guarantee of legal knowledge was, until very recently, a sham, there is some tribunal within the bar charged with the responsibility of seeing that advocates are not guilty of flagrant misconduct. Law and medicine are, in fact, generally admitted, even by the disciples of the *laisser-faire* school, to constitute exceptions to the general rule which forbids state interference with the pursuit of private callings; because lawyers and doctors are persons whom the very poorest *must* sometimes employ, and whose mistakes may cause ruin or death. The doctor deals in poisons and the lawyer stands between the suitor and justice, and in all highly civilized countries, with a complicated legal system, must stand between them; and it therefore seems absolutely necessary that somebody should formally ascertain whether they understand their business, or have character enough to perform it faithfully. The experiment of letting everybody come to the bar with as little trouble as possible, and letting the public find out the good lawyers as they find out the good grocers, was tried in this State in the constitution of 1846. The courts, however, refused to admit men to the bar absolutely without enquiry, obliged candidates to furnish certificates of "good moral character," and to pass an examination in law. But here is one more illustration of the worthlessness of regulations on paper, unless there are men upright enough and courageous enough to enforce them. We venture to say the required certificate of "good moral character" could be procured by any male adult in this city who had not served a term in the State prison, and it might, we think, be procured even by some who have served a term in the State prison—John Morrissey, for instance. The examination for admission, too, is a farce, and has for many years been a farce. Any smart boy who could borrow Kent's Commentaries for a month might pass it, and men do pass it who are no more fit to take charge of legal business than to navigate a seventy-four. The graduates of Columbia College Law School have of late been admitted, as a matter of course, without examination, but they are lost in the crowd who come in without even a pretence of training; and in the general scramble it is very doubtful whether in this city their education renders them any help whatever in securing business.

The present condition of the New York bar, as regards legal knowledge, could only be adequately described by the older members of the profession. But its moral condition is known to everybody who has had much to do with law or lawyers. No one feels any responsibility for preserving the reputation of the bar. No one attempts to punish a dishonest lawyer, unless directly interested, for himself or his clients, in securing a remedy. There are many lawyers in practice in this city who habitually plunder their clients, sometimes by retaining the moneys collected by them, sometimes by selling their clients' interests outright to the adverse party. One of the most reputable firms in the city not long ago offered a bribe to a young lawyer opposed to them, to allow judgment to go against his client by default. The offer was refused; but it would never have been made by lawyers of so much respectability if it had not been true, as they said, that such offers had been accepted in other cases. Instances in which collecting lawyers appropriate their clients' funds to their own use are notoriously far from rare; but they are seldom brought before the courts, partly because other lawyers are unwilling to expose and quarrel with their professional brethren, partly because clients think it better to compromise their claims, and partly because of the political or other influences which these rogues can bring to bear upon the judges.

The most striking illustration of the condition of the bar is to be found in the fact that, although the corruption of some of the judges is notorious and is within the personal knowledge of a large number of lawyers, not one of them ventures to expose it, or even to organize a movement amongst his brethren to prosecute the offenders. Cases of this kind have occurred in other countries before now, but only when the judges were sheltered by the government and there was no law through which their misconduct could be punished. Here the bad judges are supported by nobody except a small gang of knaves in and around the City Hall, and the people have provided ample means for bringing them to justice; and yet it would, we venture to assert, be impossible to-day to find ten lawyers, no matter how high their standing, with courage enough or public spirit enough to have a judicial offender removed from the bench, so low has the tone of the profession fallen and so thoroughly cowed are its leading members. This fact, for fact it is, suggests some startling conclusions as to the policy advocated by some of letting whatever is bad in the body politic go on getting worse, in the expectation that we shall at last touch bottom, and then the people, finding badness unendurable, will begin to work vigorously for reform. Unfortunately there is no bottom to badness. There are hardly any depths of human degradation of which it can be said that they are the lowest that can be reached. Moreover, in sinking very low, men lose the capacity for reform. In the downward progress the moral sense gets blunted, the horror of what is bad lessened by familiarity, and the desire for reform, and, therefore, power of reform, weakened. More striking examples of this truth than the apathy of the best men of the New York bar with regard to the rascalities of their professional brethren, and to the corruption and degradation of the bench, and the apathy of all classes with regard to the corruption of the city government, could hardly be offered.

Various propositions are made with a view to a reform in this state of affairs. It seems to be generally conceded that the profession of law should be regarded as a species of public office, and the State should not leave it as widely open to the world as if it were a mercantile or mechanical pursuit. Some propose the restoration of the old rule requiring a long period of apprenticeship or collegiate training; but the objection to this is that it creates an iron rule which must operate oppressively upon men of superior talent, who can qualify themselves for practice in half the time required by others. In this country it is by no means uncommon for men who have followed mercantile or other business for years, after coming of age, to forsake these occupations for the practice of law. Such also was the case with one of the profoundest legal writers of England, who entered into the law after he was forty years old, and had to wait several years for admission. An arbitrary delay is unjust to such men, whose experience in business affairs is often of more value to them in their legal practice than half the training of a lawyer's office or of a classical institution.

The real remedy, as it seems to us, must be found in more stringent examinations at the admission of candidates, and in a more rigid watchfulness over the conduct of lawyers after their admission. For both of these things there is sufficient provision by law; but neither can be practically attained without an entire reform in the judiciary, nor without an effective organization of the better class of members of the bar. Judges whose integrity and ability are beyond question, and whose position is sufficiently secure to make them fearless of evil-doers, will not hesitate to purge the profession of unworthy members upon proper application; and there is abundant material in the bar, even as it now exists, for an organization which should make it a business to expose fraud and trickery, and secure their punishment. The failure of past efforts for this purpose need not discourage any one, provided the Convention has the wisdom to frame, and the people to ratify, a constitution abolishing the elective judiciary. That system is the root of most of the evils from which justice now suffers, and all the power of good men should be directed to a change in it.

"FEMALE INFLUENCE."

The elevating and refining influence of women on society has been for many years a favorite theme at debating clubs, commencement exercises at colleges, and amongst the writers for country magazines and the flowery orators who are usually called upon to respond to the toast of "Woman" at public dinners. In the discussion about the admission of women to the suffrage which is now raging, the opponents of the movement are very eloquent on the same subject, and draw glowing pictures of the enormous moral power wielded by women in social life, and wielded for good, and which women would be sure to lose if they were permitted to vote. Anybody who is familiar with the declamation which is poured forth on this matter, year by year, will acquit us of exaggeration when we say that the sum and substance of it is that man—that is, the male man—is a creature with naturally low and coarse tastes; that the influence of men on each other is hardening, even brutalizing; that communities composed of men solely naturally and inevitably drift into sensuality and irreligion, and that the presence of women is absolutely necessary to prevent men making beasts of themselves; that therefore women are the great civilizers and elevators of society. This work of civilization and elevation they do negatively, however, if we may say so, rather than actively; not by the utterance of valuable thoughts, or by the example of lives of usefulness or self-sacrifice, so much as by being pretty and graceful, patting men on the head when they are tired, bringing their slippers to them, playing on the piano for them, putting arnica and wet cloths on their bruises, looking grave and blushing or leaving the room when they are profane or indecent, having silvery laughs, making nice little absurd speeches about the events of the day, breaking down sweetly over arithmetical calculations, and in being so very helpless and very dependent, both physically and mentally, as to call on men constantly for displays of tenderness and sympathy. In fact, the refining portion of their influence seems to result from the entertainment afforded by their innocence, absurdity, and inefficiency and prettiness, and the softening portion from their constantly furnishing the men about them with a spectacle of physical and mental weakness.

We do not say this picture is a true one, but it is the picture drawn by two-thirds of those who talk about "woman's influence" on society, as it is now exerted, and praise it up as something not to be changed or meddled with, and who maintain that, if we exposed women to the play of political passions or interests, something very valuable would be lost to the world. We are, however, of the number of those who, while thinking the millennium a long way off, and while expecting no sudden or very marked improvement in human society from any regulation or extension of the suffrage, do still believe that the influence now exerted by woman on society is not half so great as people believe it to be; that what there is of it is not wholly good; and that we have reached a stage of progress at which it must undergo some change to prevent its becoming positively mischievous or retarding, and who think that, apart from all question of right or justice or good government, anything which promises to make the female mind a little more masculine in its way of working will be a positive gain for society. The arts by which women spread refinement and purity nowadays are arts which were adapted to the condition and habits of men in the Middle Ages and down to the end of the last century, but they are antiquated, and bid fair very soon to become, if they are not already, useless, and worse than useless. The man for whose cultivation and elevation the typical lady of modern society was created was a man who passed his days in hunting or fighting or robbing, and his evenings in drinking and listening to indecent songs and stories. He had little or no book-learning; he had very few ideas; in politics and religion he did not think, he felt; and in the conduct of his life he was governed by a code of his own invention, in which sins were elevated into the rank of virtues and virtues degraded into crimes. His passions were boisterous, his sense of resentment strong, his hates violent, and all his tastes coarse. The woman of that time, therefore, became just the kind of woman which such a man required in order to keep society from going to pieces. He being passionate, overbearing, impatient of contradiction, and unused to self-restraint, she became sweet-tempered, submissive, patient, forbearing; he having no education, few ideas, and having absolutely no interest in intellectual pursuits, she became a sort of refined amusement for him—something vastly purer than he could get in the hall amongst his retainers or at the dinner-table with his male friends; she sung or played on some musical instrument for him, or said pretty nothings to him, or caressed him. He passed his days in a world of lawlessness and violence, in which most men carried their lives on their sleeve, and in which nothing was respected but the strong hand; he found in her a companion who lived by the moral law, who had no defence but her weakness, and who could be, and was proud of being, pure and above reproach, and who diffused around her an atmosphere of calm. Her society furnished, in short, a complete contrast to men's society; it was not only something different, it was something vastly better; it had to be better to prevent the family, as an institution, from disappearing completely.

Within the last century or two, however, a great change has come over men's manners and modes of life. The man who in the eighteenth century spent his days in fox-hunting or badger-drawing or cock-fighting and his evenings in boozing or quarrelling, because he could find nothing better to do, now finds a thousand means of refined distraction, and is, consequently, a changed man. Men now travel a great deal, read a great deal, listen to a great deal of music, are fond of and see a great many pictures, attend meetings and lectures, and are constantly occupied with weighty problems in sociology, in religion, in morals, in science, or in trade. In fact, commerce in our day has become so widely diffused and its operations so complicated that a business man's brain is worked almost as hard as a mathematician's was a century ago. In every field of activity men have made enormous strides in advance. They are more moral, more refined, more reflective, more intellectual, purer in their tastes and pleasures than they were, and this we take the liberty of ascribing not to female influence, but to the progress of civilization, to the influence of art, science, literature.

But while men have changed, women have remained very much the same. Their range of ideas is about the same it was a century ago; the arts by which they please are about the same; they still play a little, sing a little, dance a little, talk a little bad French, look pretty through ever varying combinations of color and form in dress; still remain amusingly ignorant of "men's subjects" and "men's books;" still talk charming nonsense on the "great questions" of the day; are still proud of their inability to reason, and are still supposed to be incapable of taking care of their own virtue, and have to have "male protectors" to murder the people who seduce them; still revel in sentimentality; and still make amusement, pure and simple, the great business of the early part of their life. We do not say that, such as they are, they do not exercise a refining influence on manners, particularly in semi-civilized communities. In the mining regions, for instance, where adventurers from all parts of the world are assembled together in mad pursuit of gold, and where the law lies in every man's revolver, and home or household is unknown, we can well believe that the sight of a petticoat in the streets, or of a woman seated at her own fireside, does, by recalling the civilization which has been left behind, and the tender memories of home and childhood which never wholly die out in any man's breast, make the community somewhat better than it was, and accelerate its progress on the upward road. But no careful observer of the signs of the times can help seeing that woman's power as a moral and social influence is, in all the more highly civilized countries of the world, decidedly on the wane; that she does not fill the place she used to fill in men's eyes; that the parlor does not furnish the pleasant contrast to the world outside that it once did; that her "pretty ways" have by no means the attraction they once had; that marriage is falling more and more into disfavor, and amongst young men of the educated classes becomes rarer and rarer, club life and irregular connections more and more popular; that—to express an unpleasant idea in a plain way—the wife does not, in their eyes, differ sufficiently from the mistress to make it worth while to encounter, for her sake, the hard work, privation, and self-restraint which, in our days, are necessary to maintain a household comfortably and give children a fair start in life; that the fine speeches one hears about female influence are simply repetitions of phrases which once had a meaning, but have lost a large part of it; that, in short, the average woman of to-day, after she has been duly trained for the society of the modern man, and "brought out" by her mother, does not differ essentially from the woman who was trained for the society of the man of the twelfth or seventeenth century, while the difference between the two men is enormous.

The vices to which men incline in this age are not coarseness and brutality, and yet these are almost the only vices against which woman's training in the present day enables her to contend. Men's manners are tolerably soft, and are, under all the influences of our civilization, growing every day softer, and would grow softer, in our opinion, if (which Heaven forbid) there was not a woman in the world. The sin which most easily besets modern society, that into which even the best men in the most highly civilized countries are running, is the sin of materialism, the love of material enjoyment and of display, the lavish expenditure of money on the means of physical comfort, and on the elevation of physical comfort into the great end and aim of life; contempt for ideas, for moderation, for simple pleasures, for self-denial; indifference to all distinction not based on or supported by money. To this tendency, which, in some of the great capitals of the world, is reproducing the

mental condition of the pagan society of the ancient world, woman offers absolutely no resistance. On the contrary she is, we venture to assert, the influence which most favors and promotes it. She is the spur which in our day sends men through fire and water in pursuit of wealth; she is the goddess for whose shrine the costliest things the air, earth, and sea affords are sought. To have their wife outshine other women, or have her think she outshines them, in plate, houses, horses, furniture, dress, and jewellery, is at this moment the object on which the health, heart, soul, and energies of half the men of the modern world are expended. Of real enjoyment of the fruits of men's toil, men every year get less and less—women every year more and more. That women should play no nobler part than this in society we can hardly wonder, when we consider what their education is. There have been additions made to it of late in the schools, but in point of fact the multiplication of instructors has ended in little else than an increase of weariness, because at the age at which a boy really begins to lay hold of ideas, and to prepare in earnest for the great work of life, a girl is taken home, and "brought out." During the next ten years—in other words, the golden period of her life—she is simply a candidate for matrimony, and her sole occupation is going on visits to "young friends," and having "young friends" come on visits to her—the visits being passed in going to parties, reading novels, and criticising young men, and the whole energies and thoughts of all her friends during that period being devoted simply and solely to providing her with amusement, to securing her what is called "a good time"—that is, constant protection against serious thoughts by constant changes of place and people and clothes.

It may, of course, be said that, as society is at present constituted, woman's proper sphere of activity is social life, that it is in this her ambition has to be gratified, and her triumphs have to be won; that social life consists largely in the dispensing of hospitality, and that hospitality, to ordinary human beings, is rendered all the more grateful by elegance, costliness, and even display. We admit that it would be difficult to rate too highly the social art. There is no grace, or gift, or acquisition which does not enter into it. Society is, perhaps, the purest pleasure of civilized life, and that of which the influence may be made most elevating and refining, and we admit, too, that the conduct of it rightfully and properly belongs to woman; that she has all the natural qualities required to conduct it successfully. But we deny that she does conduct it successfully, and we deny still more emphatically that she receives any training for it, either from teachers or parents. Of course every man can recall exceptions to this rule. One meets everywhere women so richly endowed by nature that art could do but little to heighten their attractions, whose influence on men is ennobling, whose lives are a constant protest against the materialism of the age, and in whose hands the art of entertaining becomes the noblest of all the arts—the art which does most to purify ambition, to exalt the ideal side of life and cast down the material, and to infuse grace, sentiment, and poetry into the daily doings of commonplace people. But only comparatively few women are thus endowed. To play their part in society with efficiency, most women would need, it is safe to say, a more elaborate training than men receive for any pursuit or calling. Personal adornment and the tasteful arrangement of the house are, after all, only the lowest branch of the art; and how few women ever receive for this art any training whatever, and how few can be said to possess it. If they devoted their lives to the acquisition of it—if even the "leaders" of "fashionable society" had or could make any pretence to it, there might be sense in the cry that the suffrage would spoil the sex for social life. As it is, the cry is senseless.

We admit we have only discussed the subject from an economical point of view, and want of space compels us to leave many things unsaid and many other things only half said. The passional influence of women, on which we have not touched, is, of course, very powerful, and affects men and society at large very seriously, but that influence is not likely to be affected by any possible distribution of the franchise.

HOW WE MIGHT RIDE.

A RECENT article in the *Revue des Deux Mondes* is devoted to an account of the public conveyances of Paris, and from it we derive the statistics which follow. In nothing does the French passion for organizing appear more strongly than here, nor to better advantage.

For ten years succeeding 1855 all the coaches of Paris of the genus *fiacre* were controlled by a monopoly. A strike in 1865 made evident some evils which caused in May of last year a return to free competition, by sanction of the Government, and now, under certain impartial conditions, everybody may station his carriages on the public way or let them from his own private stand, or both. There are now reckoned 1,800 proprietors, of whom nearly half own but a single vehicle and a single horse; and there is, besides, the General Company, which surpasses all in the extent and efficiency of its organization. Their carriages, which, under the general name of *fiacre*, or *petite voiture*, embrace the *coupé* (or English cab), victoria, and various other well-known styles of four-wheeled carriages, are divided into three classes, according as they stand in the streets (*de place*), or in livery stables (*de remise*), or are at liberty to do either (*mixtes*). The first are numbered conspicuously on the body and on the lanterns in gilt; the last two in red, with the addition of the stamp of the prefecture to which they are subject, P. P. (police), P. S. (Seine). There are 6,101 conveyances of this description, of which 5,181 have a right to stand at the 158 stations indicated by the police, for an annual payment of a franc a day (Sundays, of course, not excepted). The coachman is dressed in uniform, and his carriage is generally scrupulously neat and in good repair. But among the small proprietors it is not strange that something like our New York "bummers" should be met with. Within city limits his charge for "la course," *i.e.*, from his stand to your destination, as you may see by the card he hands you on entering, is one and a half francs (thirty cents specie), with a few cents extra for "pour-boire." By the hour, for as many as the coach will hold, his charge is two and a half francs, or half a dollar. These prices are unremunerative, seeing the great extension of the city by annexation, and the ascending prices of fodder. They will probably soon be raised, as they ought to be, and regulated by the kilometre of travel.

The General Company keeps also its carriages called *de grande remise*, which are let by the day, month, or year, and are designed for the accommodation of the wealthy. For these, the finest of all, they keep the most expensive horses and the most stylish drivers. Monsieur Oran Haut-ton may hire a *calèche* with eight springs and two matched horses for 1,200 francs a month, plus 150 francs for the driver, and six francs a day for the footman, if he desire the latter appendage. At his wedding, the company will furnish any number of aristocratic vehicles, and put bouquets in the button-holes of the drivers. They will at any time dress the latter in his chosen livery, powder them, and paint his coat-of-arms on the panels of his coach. Nobody, in short, shall know that he is not parading his own property and surrounded by his own servants. There are 2,950 of these conveyances.

The number of employees of the General Company is 6,815, of whom 160 are in the company's offices, 900 in its workshops, 160 are inspectors, 180 smiths, 900 washers, 200 greasers, 500 grooms, and 3,925 drivers. In 1866 it owned 4,500 carriages, putting 3,200 in circulation; 10,741 horses, well fed, well groomed and housed, broken in gradually to their work, with abundant relays, constant medical inspection, etc., etc.; and there were 30 livery stations, whose rent was more than $20,000 per annum. The Company makes its own carriages from the raw material, and every year turns out five hundred new ones, which may last twelve years, and will last ten. A new cab weighs upwards of 1,200 pounds, and will seat four persons besides the driver. It is registered by itself, and a regular account kept with it. Its daily wear is estimated at half a franc; it is painted twice a year, and in the end gets broken up in the shop where it was made. It will then have outlasted two, three, or perhaps four lives of the horses attached to it. In its stable economy especially the Company's system is most admirable; but we cannot go into details. When the driver makes his appearance in the morning he finds his team cleaned and harnessed, and the smith, the wheelwright, the glazier, and the *dégraisseur* have severally examined the objects of their special attention, and never send out a loose shoe, a broken spring, a weak axle, or cracked tire, or broken glass, or greasy cushions. When he takes in a passenger at the private or the public stand, he notes in a little book the hour, the place of departure and of destination, shows it to the inspector at each station, hands it in at night with his fares, less the four francs (his meagre day's wages), and goes to lodge where he pleases.

The police alone authorize a man to be driver of a public conveyance. When he applies to them, they enquire thoroughly into the genuineness of his credentials, writing to his last employer, writing even to his native town for information. If the answers are satisfactory, the driver gets his permit, and with it a number irrespective of that of his coach, and a *dossier*, *i. e.*, his papers or "charácter," a sort of history and minute description of the man. Should he apply for employment to the General Company, they exact of him a twenty-five franc entrance fee, after an examination calculated to test to the utmost his knowledge of Paris streets. He deposits besides, as security for the payment of the fines he may incur, 200 francs, and then has a six-months' trial before he is fairly installed. He is

probably from the provinces, or of that vast shoal of bankrupts who have experienced fatal reverses in fortune and descend to anything for a living. He is either a decent whip, generally sober, pilfering little from his employers, or generally drunk, or a "bohemian"—the *enfant terrible* of coachmen. In any case his sense of what is and what is not his property will be exceedingly weak, but his cunning surpasses the ingenuity of all devices for detecting him. The Company plants an inspector at every station, who every five minutes records the number of carriages present, watches that the foremost drivers do not feed their horses, nor leave them without permission, and notes the hours of departure and arrival. Other inspectors rove from station to station, taking notes by the way. The Company supports also a secret police, selected from its patrons, and these the drivers dread more than all other surveillance; but they only reveal a part of the dishonesty and misconduct, and they cost, in 1866, 229,552 francs, besides 50,000 paid to the agency which directs them. The fines go to the treasury of mutual aid societies, of which the drivers are members along with other employees. Lastly, the *sergens de ville*, in behalf of the city government, watch the drivers most uncomfortably, and every Tuesday dismount those who have been complained of the week previously, and have been found guilty. The police never fine; the Company dismounts only in the last resort. It is estimated for all Paris that the drivers of the *petites voitures* pilfer 6,680,595 francs a year, by retaining three francs per diem above their allowance; and there is no help for it.

We can barely allude to the special receptacle for things lost in the carriages, which the driver is bound to gather up and deposit with the police. Everything, to a glove, is labelled and numbered, with all circumstance; the owner, if discoverable, is written to; but only forty per cent. of the articles are returned, and one-third of the remainder are umbrellas!

The omnibuses are a monopoly which dates from February 22, 1855. There were, in 1866, 664 of these vehicles, not to mention nearly 200 attached to the railroads. In 1834 the system of exchange-tickets (*correspondances*) was introduced, by which one payment secures a passage on two lines. The Philadelphia horse-cars have or had not long ago a similar arrangement. In 1853 the top of the omnibus was provided with seats along its spine, which are reached by steps at the rear and accommodate twelve persons at three sous each. The interior holds fourteen, at six sous each. When all are filled, the sign "complet" is exhibited, and then it is vain to signal the driver or conductor. The omnibus is longer and broader than those with us, and much nearer the ground. In the outbreak of revolution they are the first prey of the barricade-makers, as ours were in the July riots of 1863. The horses are taken out, the omnibus turned up on its end, and the red cap perched on the end of the pole. They are so heavy and carry their centre of gravity so low that in a press of vehicles they almost always secure the right of way. Like the Persian cavaliers, the Company uses only stallions (9,656 in all), who endure much better than geldings. There are ten attached to each omnibus, serving every day, two at a time, in five relays. On steep acclivities they are assisted by an extra horse. They are stalled and fed in couples in the same box and at a common manger. There is thus a perfect understanding between the driver and his team.

Compared with the hackney coachmen the omnibus drivers are "d'une moralité extrême." Why should they not be? They get only four francs daily, it is true, for the first year of service, and in three years will only have increased this sum to five; but they get now a daily "bread indemnity" of two sous, which goes to offset the high price of provisions, and are clothed at cost and doctored gratis, and have their mutual aid and insurance establishments (*caisses de secours, caisses de retraite*). Besides, they handle no money and are not tempted, and have no solitary passenger to browbeat or defraud. It is the conductor in this case who has to be watched, and must pull the wire of a tell-tale dial and exhibit his book to the 120 inspectors, and withal look out for secret spies as best he may. In reality he steals very little, not so much from principle as from want of opportunity.

There are thirty-one lines of omnibuses, which traverse Paris in almost every direction. In 1866 they carried 107,212,074 passengers, or about 447 per line daily. The lines would be fewer and the average greater but that the Company is compelled to run lines through districts that would otherwise be neglected on account of their poverty, and to charge, nevertheless, a uniform tariff. It is a singular fact that the day of the week conspicuous above the rest for slender receipts is Friday, which the superstition of a Catholic country converts into a day of repose, as not being auspicious for journeying. The earnings, finally, would be more considerable except that, over and above the municipal taxes, the Company is obliged to help clear the snow from the streets.

It is difficult to compare the locomotive facilities of New York with those of either Paris or London. The peculiar topography of this city, its insular situation especially, compels thousands to ride who would naturally walk. Since nature has prescribed limits on three sides, the steam-cars and ferries that are constantly transporting people to and from the suburbs must enter into the supposed comparison. It is, perhaps, true that we walk more from a love of it than either Parisians or Londoners, but it is equally true that with many of us it is a choice of evils, and that with greater facilities there would be far more riding than there is now. Some one who has the leisure will perhaps also take the trouble to estimate exactly for New York the modes of transportation, the number of passengers, the number of vehicles, of horses, of drivers—in short, all the particulars as we have reviewed them in the French system. The first information elicited will be that there is no system, as there is no monopoly, among us. No one company owns most of the hacks and carriages of livery, none controls the omnibuses (or, as we call them, stages), none evolves order out of the chaos of horse-cars, and the strong arm of municipal government to protect the rights of the public is only feebly supplemented by the State. It is easy to gather the superficial data: that there are about 750 coaches that stand at our ferries, our railroad depots, and in the streets and squares, and about 650 "special coaches," as they are called at the City Hall—*de remise*, in Paris, as we have seen; that none of these are at present obliged to take out licenses; that the usual price, where no extortion is attempted, is about the same for each class—$1 50 per hour, with this difference, that the special coaches charge for the vehicle, whether full or partly filled, and are, therefore, cheaper (as they are far cleaner and more respectable) than the others, which charge each passenger the gross amount; that single trips are more or less expensive according to distance—for $6 one may ride handsomely through Central Park, and for $10 to High Bridge. Regular customers can easily obtain the same driver for every occasion, and perhaps in other respects our first-class livery-stables may approach the "grande remise" of the Paris company. We should suppose that 4,000 horses would be a fair estimate of the cavalry of these conveyances.

Of omnibuses there are seven lines, embracing, perhaps, 300 vehicles—never, in our experience, "complet," in any sense of the word. They can hardly employ 3,000 horses, though it would not take them long to use up that number. The drivers' wages are from $1 50 to $1 75 a day, and it is well understood—by nobody better than by the proprietors—that they regularly help themselves from the cash-box according to their needs and their astuteness. Only the inordinately greedy man can be said to be in danger of detection, for proof is very difficult here, and must be obtained chiefly by averages. Spies are sometimes but not systematically employed, and when suspicion has fallen upon a driver he is dismissed "sans phrases."

There are twelve main and four branch lines of horse-railroads, moving upwards of 800 cars, and owning certainly not far from 8,000 horses. They have extensive stables, with forges and repair-shops attached, but no factories, we apprehend. The drivers and conductors of some receive equal pay, generally $2; of others, $2 25 and $2 50 respectively. What means are taken to preserve the integrity of the conductors we do not know, but the dial system of reckoning passengers was soon abandoned as farcical. In Cincinnati we learn that a trial is to be made, at least in the one-horse cars, of the exploded omnibus device of a transparent cash-box, inaccessible to the driver. In the end it is found that some dependence has to be placed on the honesty of man, and though the losses can be diminished, they can never be wholly prevented.

We have before us a stereoscopic view of the Strand, London. Approaching the spectator, and in the order of mention, are a hansom, a cab, and an omnibus—the last not much different from this at the station Place de la Bourse, or that discharging a passenger on the Boulevard de la Madeleine. The cab is a one-horse coupé, with the driver's seat so low that his head alone shows above the top of the carriage. With us the seat is commonly higher, and the coupé is often drawn by two horses. The hansom is an unfamiliar object in our streets, though one may be seen daily on 'Change, and appears to belong to one of our hotels. It is a low-swung chaise body, with a wooden boot making a front impervious to the wet and mud, a driver's seat behind, and window or trap at top communicating with him. The reins pass over the top, and rub a light iron railing on its edge. These two are the vehicles of the future. They were both tried in New York something over a year ago. Two cabs and four horses were procured, and put in circulation as a charitable experiment; they proved a pecuniary success. The number was extended to eighteen, of which one was a hansom, the rest coupés and victorias. There was opposition; but, resolutely met, it accomplished nothing. The enterprise failed from the usual dishonesty of the employees, and for want of personal attention on the part

of the proprietor, whose proper business he could not neglect. The rates were $1 an hour in the city limits; $1 50 including Central Park or crossing the ferries. More extensive calculations were subsequently made for hansoms and coupés, to be managed by a stock company, but from what we have seen of the figures we judge they were too favorable, and that the profits were over-estimated. This scheme proposed as rates twenty-five cents a mile per passenger, or $1 per hour, and the driver's wages were reckoned at $12 a week. It was further estimated that each day-cab would return (net) $7 50, and each night-cab $5—that is, about twelve hours' hire. But, in 1864, when fodder was cheap, the General Company of Paris realized but 14 francs 55 centimes (about six hours' hire) per cab, of which the day's expenses were 13 francs 42 centimes—a very narrow margin of profit; and in 1865 the figures stood: expense, 15 francs 27 centimes; return, 14 francs 67 centimes—an absolute loss.

We feel very sure that there is scope enough for these small, expeditious, and reasonably cheap conveyances, which no amount of tunnelling or bridging will seriously interfere with, and which will span the serious difference between the car and stage fare and that of the coaches, while giving us all the conveniences and none of the disadvantages of each. We believe, too, that here is an admirable field for the co-operative principle, and we venture to predict that the best solution of the problem how to guard against the peculation of drivers and conductors will be a system in which the gains of these employees are made contingent upon the profits of the companies to which they are attached. Add to this, as far as possible, a uniformity in dress for the sake of an *esprit du corps*, employ good men at fair wages, and there will be reason to hope for the best results for the public and for the capital invested.

THE "GENIAL CRITIC" IN A NEW FIELD.

It was our pleasing duty some weeks ago to make known to our readers the proposal made by the "Genial Critic" of *The Independent* to supply the book publishers with "candid and favorable reviews" of all "books of merit" they might be pleased to send him, in return for the advertising patronage. The inducements he had to offer were obvious, and were set forth with great clearness and explicitness, and foremost amongst them was a very large circulation amongst reading families in "comfortable circumstances," including "eight thousand clergymen." We had for some time previously observed with regret that the Critic, instead of devoting the whole of his valuable time and attention to book notices and book advertisements, had displayed an unpleasing partiality also for presenting the reading families and the eight thousand clergymen with the advertisements of quack doctors engaged in the Christian duty of relieving diseased libertines of their spare cash, and for puffing petroleum and other corporations of limited present means but very brilliant prospects. For this we fully expected every week that the Congregational body, whose organ he professed to be, would call him to account, well knowing that the puffing of quack medicines and rising oil companies was forbidden by the laws of Christian morality. We were, therefore, somewhat surprised to find that he was not visited with any formal censure whatever until he revealed symptoms of unsoundness in his doctrine, upon which he was summarily brought before the ecclesiastical tribunals, deposed from his office, and a new organ started in his stead. We were curious to see what use he would make of his newly acquired freedom, knowing his insatiate lust for advertisements, and watched his course with some anxiety. On the 11th of July there appeared in his columns a savage attack on the bonds of the St. Paul and Chicago Railroad, which led us to hope that he was engaged in the noble work of warning small and ignorant investors against a swindling enterprise, and we were beginning to feel devoutly thankful that in the midst of the general corruption we had at least a pure and fearless "religious press." We were therefore greatly pained to discover last week in an obscure corner of the New York *Tribune* the following unfeeling letter:

"The New York *Independent* seems to be still in the 'general order business' which filled so much of the report of a committee of the last Congress on the New York custom-house. *The Independent* has apparently taken a general order to break down the St. Paul and Chicago Railroad. The Congregationalists of the West have decided, for the most part, that *The Independent* never took holy orders to any great extent. They have accordingly established a paper of their own, under the charge of the Rev. W. W. Patton, called *The Advance*. The people of the West intend likewise to advance the St. Paul and Chicago Railroad, in spite of the calumnies of the financial director of the New York *Independent*."

"Office of Lockwood & Co., Bankers,
New York, July 15, 1867.

"The foregoing, cut from a Western paper, suggests the propriety of our indicating to the friends of the St. Paul and Chicago enterprise, and to the public generally, the power that binds the pen of the financial writer for *The Independent*, Mr. H. C. Bowen, who is also, as we are informed, publisher and proprietor of that paper.

"On the appearance of the St. Paul and Chicago Railway advertisement, it was solicited for *The Independent*, first through its agent, then personally by Mr. Bowen, who called at our office, and finally by a letter from that gentleman addressed to one of our firm. On these occasions Mr. Bowen *proposed to give the bonds a very favorable editorial notice* if they were advertised in his paper, offering that as a great inducement.

"Soft words failing, some three weeks since he sent us a proof-slip of the article which appeared in the issue of *The Independent* of July 11—not printed until after he despaired of the success of his blackmailing efforts.

"Lockwood & Co."

We greatly fear that if this sort of attack on a modest and unassuming Critic be persevered in, the natural sweetness of his disposition will disappear, and he will write scurrilous "notices" not of railroads only, but of some of the choicest compositions of our best authors.

For the guidance of the Critic in his dealings with coy or niggardly advertisers we subjoin a form of circular which we take from the columns of our esteemed English contemporary, *The Tomahawk*:

"We have now been long enough established to sell our pages to enterprising advertisers, like the rest of our contemporaries. We beg, therefore, to submit the charges we make in the 'literary' part of our paper for their inspection, premising that their orders shall be attended to with wit, economy, and despatch:

"*A good 'quotable' Review of a trashy Novel.* From half-a-dozen gratis copies of new works up to one insertion of a half-column advertisement.

"*Superior ditto, with Latin quotations.* From one insertion of a column advertisement up to twenty-five insertions of a page advertisement.

"*A nice pithy critique of a condemned play.* From four orders for 'Two to the Boxes' to an 'Admit three to the Stalls.'

"*Superior ditto, with genial and humorous description of the plot.* From half-a-dozen private boxes to perpetual advertisement on the editorial page.

"*A logical defence of the foreign policy of the government.* From three scraps of good information up to a consulship for the editor.

"*A pleasant notice of a grocery, etc.* (*warranted sound and serviceable*). From a pot of pickles up to Five Pounds."

L. W. SCHMIDT,

GERMAN BOOKSELLER,

24 Barclay Street, New York,

Regularly imports all the leading Foreign Publications, including Periodicals.

The following Catalogues of his large and carefully selected Stock may be had gratis on application:—1, General Catalogue; 2, Theological; 3, Philological; 4, Educational; 5, Scientific; 6, Medical; 7, Catalogue of Periodicals published in Germany, France, and England.

NO INTELLIGENT FAMILY

should be without the whole or part of the WRITINGS OF WASHINGTON IRVING, of whom Bryant prophesied a "deathless renown."

Complete sets, or separate series, or single volumes from 75 cts. to $270. Send for price list.

G. P. PUTNAM & SON,

661 Broadway.

FOR 30 DAYS.

In replenishing their libraries, Ministers and Sunday-Schools will find *great bargains* at our store.

Among our immense stock are 100 sets of Smith's "Bible Dictionary," 3 vols., elegantly bound. Sunday-School books from all the societies and publishers.

Be sure and give us a call.

The Week.

THE exceeding dulness of the season since the adjournment of Congress has driven many politicians into making nominations for the Presidency, although the Convention will not sit for a year yet. The Republican Central Committee of this State has begun the work by nominating General Grant, though what is gained by this sort of thing it is hard to see. The theory of the performance we suppose is, that by keeping a candidate's name before the public you familiarize them with the idea of electing him; but, on the other hand, you expose the candidate himself to many and divers temptations, and you give an immense stimulus to the malignity and ingenuity of his enemies. General Grant seems just now to be the favorite; but whether he will remain so will depend on his skill in keeping out of scrapes during the coming twelve months. Not all his reticence will any longer avail him, as conversations, more or less elaborate, will be invented for him and energetically circulated.

Senator Wilson has made a sensible speech at Saratoga, in which, talking of the next President, he said that the people would vote for either Grant or Sheridan, or Thomas or Chase, or Colfax or Brave Old Ben Wade, and this being the case the haste in making nominations seems to us ridiculous. Some of these gentlemen are sure to be forthcoming next spring. We are glad Mr. Wilson mentioned Old Ben Wade, as that gentleman has been somewhat under a cloud since the Kansas speech, and needs to have something cheering said to him. Mr. Wilson's summing up, in which we cordially concur, ought to put many troubled politicians at ease, that "no man who opposed the cause of the country during that war, no man who opposed emancipation, no man who opposes the civil rights of the emancipated race, no man who opposes negro suffrage, will ever be President of the United States again."

Great preparations have been made to prevent rioting at the elections in Tennessee to be held to-day, and it is said that troops have been moved from Kentucky into Tennessee by Grant's orders, in view of the emergency. *The World* sees in this a monstrous violation of the Constitution—the Legislature not having called for the troops; but the matter did not strike it in this way when there was talk of Governor Swan's calling in Federal troops to put down the Maryland Radicals last winter. But the state of things in Tennessee is shocking. We do not see that it makes much practical difference whether the existing troubles are due to the indiscretions of the Radicals or the villany of the Secessionists. The fact seems to be that the Radicals are not strong enough to exclude their opponents from the polls, and no such exclusion ought to be attempted unless there is force enough to make it effectual. The result, so far, is a close approach to anarchy, and it becomes a grave question whether an experiment which has fared so badly thus far ought to be persisted in. What has now to be decided is, whether Tennessee shall or shall not be governed, like the rest of the South, for the present, by the Federal forces. The minority has tried to do it in the regular way, and it is in no unfriendly spirit that we say it has failed.

The New York *Tribune*, of whose faults we have often made mention, has taken a course with regard to the condition of the judiciary here and elsewhere which entitles it to the gratitude of the public. It is, as we mentioned last week, the only paper in this city which has called attention in fitting terms to the shocking revelations of the condition of the bench in this city, in the last number of *The North American Review*, and it offered on Tuesday last a strong protest, which we trust will be heeded, against the way in which the Pennsylvania Republicans are conducting the canvass for the election of the Chief-Justice of the State. The office is being fairly dragged through the political mire. One of the points made against Judge Sharswood, the Democratic candidate, is that he decided against the constitutional power of Congress to issue paper money. But if judicial decisions on points of law are to be cited against candidates at elections, we might better abolish the judiciary altogether, and submit all legal controversies, above a certain amount in value, to mass meetings and decide them by a show of hands.

The final action of the Michigan Constitutional Convention has not yet been taken, but some indications of what will be submitted to the people are plain enough. There will be no color in the constitution, even the Indian being "admitted to equality." It is also probable, in spite of the decision at Albany, that woman will be invested with the suffrage, so far as lies in the power of the Convention, and many persons believe that the popular vote will ratify this enfranchisement. As the women themselves will not be permitted to manifest their own will in the matter, we shall not know what proportion of them are interested or indifferent, which, of course, has no bearing on the question of right. So we shall feel in doubt, whatever be the decision, how much to attribute to that "female influence" which is thought to be quite the equivalent of the ballot. One circumstance encourages us, in the prospect of impartial suffrage, and that is the character of the people of Michigan, who, of all in the Union, are perhaps most worthy to be entrusted with such an experiment. In no State is education more highly appreciated.

Apart from the question of its legality, the importation of coolies into the South is in every way to be deprecated. It appears, nevertheless, to have been begun in Louisiana, the supply being brought from Cuba. There are many decisive reasons against it, of which the first is that they are not needed, and if they were—if there was a veritable scarcity of labor in the State—far greater advantages would result from European or Northern immigration, which is only prevented by the instability of Southern society, the fault, as everybody knows, of the persistently rebellious. But in the next place, the coolies are chiefly desired not to supplement but supplant the negroes, of course by inferior wages and a larger measure of physical control—a twofold disaster to the laboring classes, and another proof of the con-

tumacy of the South. Inevitably there will follow the same evil consequences that attend always the contact of a superior with an inferior civilization, seen already in our history in the case of the imported African and the native Indian. And, finally, the evil which is peculiar to the coolie trade—the total absence of women—will aggravate the licentiousness bequeathed by slavery, and make the Gulf States, in point of chastity, the middle term between Cuba on the one hand and Utah and California on the other. The last resort of the Jamaica planters, when their unjust laws had reduced the blacks to poverty without effecting their re-enslavement, was to introduce and employ Chinese apprentices.

The effort to open the Boston Public Library on Sunday has met with a temporary defeat. We say temporary, because the agitation is not new, and evidently gains strength from year to year, and because, whatever may be thought a fair interpretation of the statute cited against the opening, people will not always consent to classify warehouses and libraries together, and assign the same reason for closing both on Sunday. The question, so far as we have observed, was argued by the opponents of the measure on the ground of principle and public morals, and not on the more tenable ground of municipal order and propriety, for which on one day of the week there may be stronger reasons for insisting than on the remaining six. The Sunday horse-car circulates freely in Boston, and carries some to church and some away from it to seek recreation in the suburbs. We apprehend that the churches would gain as much and lose no more by a circulating library, the extended use of which in any community would seem to improve the field for the preacher, the teacher, the philanthropist, and the reformer.

Juarez has, during the week, found a defender in the person of a Mr. Edward E. Dunbar, who writes a letter to the New York *Times*, showing that Juarez is a man of great polish, and in "gentlemanliness" could compare favorably with Maximilian, "while in scope of intellect, solid acquirements, and all those qualifications that constitute the true statesman, he far surpassed him." As neither Maximilian nor Juarez ever ruled a state long enough to give anybody the least means of judging what their qualifications were, and as it is only by his ruling that anybody can judge a statesman, Mr. Dunbar's comparison is worth very little. Maximilian did adminster the province of Lombardy for a short period, and did there display, inside the limits set him by a wretched system, every good quality of head and heart that a ruler needs to have. But the comparative personal merits of the executioner and his victim do not in the least affect the question of the morality and expediency of the execution, and whatever has been said of Juarez's Indian blood has been said not by way of throwing doubt on his polish and cultivation but on his humanity. A man may be as polished as you please, and as accomplished as Crichton, and yet have the heart of a tiger. By way of lighting up Juarez's descent Mr. Dunbar mentions that he is of the pure Toltec race, and adds:

"Taking the now remaining Toltecs as one family, Juarez can trace a pure lineage, clear and distinct, a great ways further back than the Hapsburg family. He comes from the mysterious regions of Mitla in Oajaca, where the winds sweep mournfully through the stately groves of cypress that shade the graves of the kings of his ancient people—graves whose dates are lost in the unknown past."

The art of reading and writing is, however, necessary to the tracing of pure lineage even as far back as Rudolph of Hapsburg, and in this the great Toltecs were, to say the least, deficient; and as to the "mysterious regions of Mitla in Oajaca," we feel quite sure the Hapsburgs can trace their ancestors up to regions fully as "mysterious," and where the wind still howls at times just as mournfully. The later accounts from Mexico are the best comment on all this balderdash. Juarez's first lieutenant, Escobedo, seems to be a pattern savage, and any Toltec that permits him to commit the atrocities of which he is now boasting is a disgrace to civilization, no matter how the winds sweep in the mysterious "Mitla in Oajaca."

A correspondent writes us a long letter, for which we have no room, showing the errors of *The Independent* in maintaining that Juarez had the same right to shoot Maximilian that Washington had to hang André, and that Maximilian, as an "alien invader," fairly deserved death. *The Independent* in its enthusiasm often takes up positions which it probably would not in calmer moments defend, and enthusiasm brought to the discussion of questions of law is, of course, likely to cause more than usual confusion. Washington hanged André under the old and well-established usage of war which makes death the penalty of being found in disguise inside an enemy's lines, and which has no more application to Maximilian's case than the Statute of Frauds. Moreover, invaders are nearly always aliens, and the practice of modern warfare is to hold them as prisoners, when taken, not to kill them. Maximilian's execution, if justifiable at all, must be justified by something exceptional in his position, and his being "an alien invader" certainly did not make his position exceptional.

A terrible lamentation is still kept up in Paris and London over Maximilian's death. One would think that a man was never shot for being caught in arms against a constituted and established government before. The *Moniteur* has actually had the folly to accuse the Mexicans of "regicide," a crime which republicans on their own soil cannot, of course, commit, and which is an odd charge to appear in the columns of the *Moniteur* of all papers in the world. The Earl of Derby positively ranted in trying to characterize the execution in fitting terms, although this same nobleman was only prevented by the Queen's personal interference and the strenuous remonstrances of the Liberals from hanging Burke, the Fenian, and was the most earnest and outspoken in his denunciations of all attempts even to have Governor Eyre's conduct judicially investigated. His son, Lord Stanley, whom he calls "his noble relative," dealt with the matter much more sensibly in the Commons. He deplored it, but warned the House that it ought not to make any formal declaration of its sentiments about it, as it was the Parliament of England only and not the Parliament of the world.

The French public also have been occupied during the past month with little else than the execution and the discussions arising out of it. It furnished M. Thiers with an excuse for another biting attack on the Imperial *régime*. It is not often, in fact, that a government supplies its enemies with such complete materials for an indictment as are to be found in the Mexican affair. Such a well-rounded, thoroughly-finished dramatic failure is hardly ever to be met with in any enterprise undertaken in our day by a civilized country. The moral which the Opposition draws from the affair is, that one man ought not to be allowed to manage the affairs of a great people out of his own head. But to this M. Rouher very naturally replies, that the Mexican expedition twice received the formal approval of the Chamber by large majorities, and to rejoin effectually the Opposition would have to go deeper than it cares to do, and acknowledge that the whole Imperial *régime*, including the mode of electing the popular branch of the Government, is a delusion and a snare and a cheat.

The part played by the President of the Corps Législatif, during an exciting discussion, is a curious illustration of the small amount of proficiency yet attained by the French after seventy years' practice in the art of parliamentary debate. In the first place, the audience will hardly ever submit to parliamentary rules on the very occasions on which parliamentary rules are most needed, viz., when passions are strongly roused. So that in a debate on any exciting subject, the orator is sure to be interrupted by contradictions and exclamations of horror and surprise, or indignation, as well as by the inarticulate uproar which the French journals describe as "mouvement," "sensation." The part played by the presiding officer at such crisis is not that of an arbiter or enforcer of fixed rules, as here and in England, but of a teacher whose duty it is to see that the right triumphs. He often sides with the interrupters against the orator, and declares that they cannot be expected to listen quietly to such monstrous sentiments, and occasionally he even admonishes the speaker on the vices and imperfections of his style, as when, in this last debate, he reminded M. Favre that "violence of language too often only betrayed feebleness of ideas." The failure to lay hold of the fundamental principles of the parliamentary art, after so long a trial, would seem to indicate some defect in the

French mind, rendering "the Speaker" an inconceivable personage When the French first began to debate, after the Revolution of 1789, Bentham offered his services to draw up a code of procedure modelled on that of the English House of Commons; but the offer was scornfully rejected on the ground that it was beneath their dignity to borrow anything from Englishmen, and they went on hallooing and shrieking rather than debating, till Napoleon turned them into the street on the famous Dixhuit Brumaire. Mr. Madison used to tell an amusing story, *apropos* of this difficulty on the part of Frenchmen in understanding some of the usages of representative government, of an attempt made to explain to one of the officers who was in this country during the Revolution the exact character of the Speaker of the Virginia House of Delegates and the nature of his functions. "Ah!" said the officer, after listening to a long and elaborate account of the dignitary's position and duties, "Ah! I understand; he 's a prince of the blood!"

Perhaps the most interesting incident in the late news from France, however, is the refusal of M. Ste.-Beuve, the well-known critic and essayist, to fight a duel. The French Senate, of which M. Ste.-Beuve is a member, and which he honors by belonging to it, is composed, as most people know, largely of successful military men, renegade legitimists, and adventurers of all professions who have managed to scrape together enough character and reputation to enable the emperor decently to reward their devotion to his dynasty by giving them seats in the body. They are not remarkable for devotion to any principle under heaven, but free thinking in religion they cannot bear, so they are very hard on the "positive philosophers" and critics of the Renan school. These unfortunates, however, M. Ste.-Beuve invariably defends whenever they are assailed, not because he sympathizes or thinks with them, but because he loves free thought and free speech, and this advocacy of his always enrages the saints by whom he is surrounded, amongst others that eminent theologian, Marshal Canrobert, who ably represents the strong devotion to religion for which officers of the French army are so remarkable. In a recent debate, in which this subject was touched upon, M. Ste.-Beuve played his old part, and was rudely interrupted by a senator named Lacaze, a man of sixty-eight, who has belonged, in the course of his life, to nearly every party that has figured in French politics, except the legitimists, and has been unfaithful to most of them. M. Ste.-Beuve replied some days later to this insult with dignity and moderation. M. Lacaze then challenged him through a Baron Heeckeren, who passed his early life in the Russian service, married a sister of Pouchkine, the Russian poet, and then killed the poet in a duel and had to fly. M. Ste.-Beuve refused to fight, on the plain and impregnable ground that he would not submit to the decision of the pistol a matter which can only be decided properly by public discussion. M. Ste.-Beuve's position, both in society and in the world of letters, is such that he can afford to set a good example in this matter, and one which, we have no doubt, will be followed, as he has already "fait ses preuves," as it is called, having fought a duel in early life. An example of some kind is necessary, as many of the literary men in Paris seem to be becoming mere swashbucklers. One of the editors of the *Courrier français* has, doubtless encouraged by M. Ste.-Beuve's course, refused to fight a son of M. de Cassagnac, the cause of dispute being whether the name Granier de Cassagnac should not be written Granier (de Cassagnac.) The matter is, however, not quite so trifling as it seems. Written in the first way, it would indicate that Granier was a *gentilhomme;* written in the second way, it would indicate that he was a *roturier*, named Granier, who came from Cassagnac. The French have a keen sense of the ridiculous, but this does not seem sufficient to save people from all sorts of social folly, just as the Irish, with all their humor, have never seen the fun of their political movements. But to make either humor or a sense of the ridiculous a defence against absurdity, what constitutes absurdity has to be previously settled, just as the value of reasoning powers depends altogether on men's ability in selecting premises.

The Sultan has gone home by way of Vienna. How much he has learned, or whether he has learned anything by his tour, we shall probably never know, or only know through his reforms at home. He has produced a rather unfavorable impression everywhere, owing, in great part, to the totally different standards of good manners in use in the East and West. The Sultan, in the first place, never acknowledges salutations in public, and, in the next place, the object which every Turk aims at in regulating his demeanor, is not to seem interested in anything or astonished by anything, an object which is not entirely lost sight of, let us say, in the manners of the upper classes in England. "His Sublime Majesty," as the Cable newsman calls him, has therefore seemed heavy and stupid to the crowds who cheered him in London and Paris. Why they were enthusiastic about him it would be hard to say. He is not, however, as the New York *Times* has pronounced him, doubtless on *à priori* grounds, a worn-out debauchee. He is in every way a very different man from his brother; always led a temperate and hardy life up to his succession to the throne, and, like most Turks who have not been ruined by the harem, is a model of physical vigor.

The Cable newsman, by-the-by, after some weeks of terrible dulness, during which he must have found life a bore, has had within a day or two another *fête* to report, in Admiral Farragut's arrival in France and reception at the Tuileries. He reports the state dinner sensibly enough, but when he comes to describe the visit of the Empress to the *Colorado* his feelings overcome him, and he telegraphs to us that "Her Imperial Majesty *graciously expressed herself highly pleased*," etc. He also mentions that she has received the honors "befitting her *exalted rank*."

The revelations recently made about the trades-union outrages at Sheffield have naturally excited a great deal of indignation in England, and the enemies of the unions have been making a vigorous use of them, in the hope of being able to procure, in the next session of Parliament, a revival of the prohibitory legislation against these combinations. Professor Beesley has been more than usually active in his efforts to bring the cultivated Radicals and the working-men closer together, and has been a frequent speaker at working-men's meetings, as well as a frequent contributor to working-men's periodicals, and, like Tom Hughes, he has never hesitated to prove his devotion to the working-men by talking to them in very plain terms about their faults. That the working-men appreciate the counsels and assistance of such friends was well shown at the Geneva "Conference" last year, when the French and Italians introduced resolutions pledging the members against accepting all aid or co-operation from collegemen, or "men of education," commonly so called, and the English indignantly protested against any such rule, and declared that they should not only disgrace themselves by agreeing to it, but should deprive themselves of their most useful allies. Professor Beesley has, since the exposure of the Sheffield outrages, spoken of them in the working-class periodicals, that is, in the place in which such talk is most likely to produce effect, in terms of the strongest condemnation, and has earnestly urged the unions to take every means to bring the perpetrators of such atrocities to justice. But at a recent meeting of working-men in London, he gave way to the not unnatural irritation caused by hearing the defenders of the Confederacy and of Governor Eyre, day after day lifting up their voices in horror over the Sheffield atrocities, as if they had never heard of anything so dreadful before, and declared that the performances of Broadhead & Co., bad as they were, were no worse than those of Eyre & Co. in Jamaica. From that moment the Professor became the mark for the scorn and execration of the combined middle and upper class, which, when they unite in a passion of any kind, as many Americans know, have the most extraordinary facility in making a man's life miserable. The newspapers have bombarded him, the dinner-tables and clubs railed at him, until "good society" worked itself up into the belief that something more than social indignation ought to befall him; so a movement was actually got up to have him turned out of his professorship. At this point, however, a reaction seems to be setting in; the Professor has shown successfully, by citations from what American politicians would call his "record," what the real nature of his influence on the working-classes has been; but the spectacle of his suffering has nevertheless furnished the Eyre party with some delicious moments.

Notes.

LITERARY.

MESSRS. G. ROUTLEDGE & SONS announce as nearly ready for publication Major Ross King's "Sportsman and Naturalist in Canada," with notes on natural history of the game, game birds, and fish of the Dominion. The book will be elaborately illustrated with chromo-lithographs and wood engravings. They also announce a cheap edition of "Guy Livingstone," and Mr. Arthur Sketchley's new book, "Mrs. Brown's Visit to the Parish Exhibition."

—In the fall we are promised a complete translation of the Bible, by Joseph Smith, the Mormon martyr. The manuscript has been for many years in the hands of his son and successor, and the plates are already being stereotyped. The word "baptize," it is said, will be retained, with the understanding that it means to immerse. The version may be pronounced in advance a curious contribution to literature and theology, and will deserve to be treated respectfully. In the universality of its missionary or apostolic labors, the Mormon religion seems more closely than any other to resemble primitive Christianity, and, perhaps, also in its almost exclusive appeals to the ignorant and the humble. Both the Josephite and the Brighamite colonies, though at opposite poles in everything but ecclesiastical organization, make more proselytes, probably, in proportion to their numbers and the peculiar condition of conversion—viz., that the converts are not to remain and build up a church where they are, but shall migrate, from all parts of the earth, to America—than any other religious body in Christendom. They present in this a marked contrast to the Quakers. At the recent annual gathering of that sect in England their present number in that country was estimated at 13,786, of whom more by 838 than half were women. The net increase for the year previous had been but *eleven*. Ninety had joined, while eighty-five had withdrawn, by conviction; so that the growth by natural increase is reduced to *six!* The reasons given for this languishing were more curious than any, we venture to say, advanced in the numerous prize essays on the subject. One Friend thought the cause was in the census itself, as David offended by numbering the people of Israel. Another thought things would be different if there were more Friends ready to go to jail; but, he asked, Who will go there? "And," says *The Pall Mall Gazette*, "who, he might have added, will send us?" The subsequent passage, in the House of Commons, of the bill abolishing church rates, threatens to remove even the small catalogue of "distraints," etc., which afforded some comfort to these "Friends in council."

—Mr. Emerson's address to the Phi Beta Kappa Society at Cambridge was a characteristic review of the advanced culture of the present age and of the responsibilities of educated men. Of politics he observed that "men are now to be astonished by seeing acts of good nature and common civility and Christian charity passed by statesmen and executed by the constable and police." The controlling influence and distinction of the century "has been the wide and successful study of natural science," from which the old chronology of six thousand years appears "but a kitchen clock or an hour-glass to the geologic periods that have come into view;" that "geology is only chemistry with the element of time added," and "nothing is old but mind," which is a "citizen of the universe." As showing that only a few experienced minds are needed to give a noble turn to the public mind, the orator remarked that "the true hope of any time must always be sought for in minorities," and that "all history is a record of the power of minorities, and of minorities of one"—in other words, of individuals. They, finally, are great men "who see that the spiritual are greater than any material forces, and that they rule the world." Such was the tenor of Mr. Emerson's pregnant discourse, of which the cumulative argument is as usual more discernible and therefore more effective in the reading than it was in the delivery. Those who heard it probably passed with delight from apothegm to apothegm without catching sight of the connection or clearly of the end from the beginning.

—From the fourth annual report of the Long Island Historical Society it appears that their first publication—the journal of the two Dutch Labadists who visited this country in 1679—has been so eagerly taken up as to return to the treasury two-thirds of the original cost. By the terms of the bequest under which the Society publishes, the outlay must be wholly made good before a second can be attempted. The work next contemplated is an accurate and detailed account of the occupation of Long Island by the British in 1776, compiled by Mr. T. W. Field. The librarian acknowledges the gift of the reports of the Massachusetts Board of Education, complete in thirty-five volumes. The first of the series were written by Horace Mann and being now rather scarce it is well to know where they may be consulted. The same donor, Dr. Samuel A. Green, of Boston, has presented other sets of reports—of the State, and of the Massachusetts Horticultural and Agricultural societies, together with a long line of Harvard College catalogues. A large number of books have been received from the authors themselves—an excellent example for all others. Perhaps the most interesting contribution to the history of the rebellion is the five-folio volumes of *The Index*—the late Anglo-Confederate organ.

—Considering their voluminousness, the sale of the original manuscripts of many of Sir Walter Scott's poems, novels, and prose works, which recently took place in London, is perhaps not to be matched in the case of any other author. These manuscripts had belonged to the late Robert Cadell, of Edinburgh, and were disposed of at auction by order of his trustees. They are described as "all in perfect preservation, and uniformly bound in russia, with uncut edges;" and the catalogue calls attention to the "extraordinary fluency with which they were written, and the very few corrections or alterations which occur in them, thus establishing a proof of the facility with which Scott sketched out the productions of his most entertaining and lively imagination." They were put up in twelve lots, and realized altogether the handsome sum of 1,255 guineas, or upwards of $6,000. That which brought most was "The Lady of the Lake," of which a part of the notes were in the handwriting of Mrs. Scott—264 guineas. "Marmion" brought 191 guineas, "The Lord of the Isles" 101, "Anne of Geierstein" 121; fragments of "Waverley" and "Ivanhoe" 130, and of "Tales of a Grandfather" 145.

—"A Catalogue of the Hebrew Books in the Library of the British Museum, printed by order of the Trustees" (London: Longmans & Co.; New York: L. W. Schmidt), has just been published. This is the largest collection of the sort in the world, comprising 10,000 volumes, the titles of which are in this catalogue alphabetically arranged under the authors' names and under the general headings, viz., Bible, Mishna, Talmud, Thoseftha, Liturgies, and Periodical publications. Anonymous works are arranged under the name of the author whenever known, and also in the index of titles. In this large collection there are sixty-five works of the fifteenth century mentioned by De Rossi, two hundred and thirty-seven works printed from 1500 to 1540 mentioned by De Rossi, thirty-two works printed from 1480 to 1540 not mentioned by De Rossi, thirty-eight books of which no other copy, or only one or two other copies, is known to exist. In order to give a general idea of the nature and importance of this collection it may be sufficient to specify the following classes: Bible and commentaries, 1,770 volumes; Talmud and commentaries, 1,430; codes of law and decisions, 1,780; Midrath, 160; Cabala, 460; sermons, 400; liturgies, 1,200; divine philosophy, 690; scientific works, 180; grammars and dictionaries, 450; history and geography, 320; poetry and criticism, 770.

—Among recent art publications in France we notice the fourth volume of A. F. Rio's "De l'Art Chrêtien," which extends to the middle of the sixteenth century (Hachette, Paris); the life and works of the late painter Ingres, by Olivier Merson (Hetzel, Paris), with a fine photograph of the subject; and "La Génie des Peuples dans les Arts," by the Duc de Valmy (H. Plon, Paris).——M. P.-F. Steenackers has written and published very sumptuously a history of the orders in chivalry and honorary distinctions in France ("Histoire des ordres en chevalerie et des distinctions honorifiques en France"). He is said to demonstrate that the principle of decorations is a democratic principle, and he does so without philosophizing, simply by the aid of historical documents. Lieutenant-Colonel Charras, one of the French exiles of the *coup d'état*, wrote a "History of the Campaign of 1815, Waterloo," which is esteemed the most impartial, in fact the best French work on this subject. At his death, which occurred two years ago, he left behind him in manuscript a "History of the War of 1813 in Germany" ("Histoire de la Guerre de 1813 en Allemagne") which has now been published at Leipzig, Charras' works being interdicted by Louis Napoleon. Unfortunately the history extends only to the battle of Lützen. It speaks without reserve of the causes of the German rising against the despotism of Napoleon I.

—A history of the French people has been commenced by M. Challamel ("Mémoires du Peuple Français depuis son origine jusqu'à nos jours. Paris: Hachette. 1867"). Adopting the method inaugurated by Buckle in his "History of Civilization in England," M. Challamel professes to write not a political history, a history of princes only, but the history of the whole population and their individual condition. To illustrate his method he proposes in his introduction the question which of the three following events of the year 1653 was the most remarkable: (1) Turenne's victory before

Rethel; (2) The pope's bull condemning the doctrines of Jansenius; (3) The publication by Blaise Pascal of his treatise on the equilibrium of fluids. He comes to the conclusion that the blood shed before Rethel contributed only to the fame of Turenne and to strengthening Mazarin's menaced power; that the second event brought about useless, deplorable, and incessant troubles now forgotten; but the third event, as the production of genius, establishing the principles of hydrostatics, is, in M. Challamel's belief, the most remarkable of the three, because, though not understood at their time, these principles are now useful for the development of our industry. He traces, with Balbi, the origin of the French from six different families, the Greco-Latin, the Germanic, the Celtic, the Basque, the Semitic, and the Hindu races, each of which has contributed something to the formation of the French language, of which the Celtic or Cimbrian was the first element. This interesting work will be complete in eight volumes, three of which, reaching to 1461, have been published.

—All our readers may not be aware that there are on the Continent certain newspapers which consist almost wholly of correspondence from all parts of the world, but chiefly, of course, from Europe. Of these the *Indépendance Belge*, of Brussels, is a French specimen, the *Allgemeine Zeitung*, of Augsburg, a German. The first-named is famous for the accuracy of its correspondence, and its liberal views often exclude it from the French post-office. It comments every morning in short paragraphs on the news of the world, but its editorial articles treat only of domestic matters. The *Allgemeine Zeitung* is the leading newspaper of Germany, yet has no editorial articles or comments on political affairs, and prints only the shortest and most unsatisfactory telegrams. But, besides its voluminous correspondence, its reputation is based on the high character of its literary reviews. A correspondent of the Chicago *Tribune* writes that the paper has five editors, who each preside over a principal European language. The chief is Dr. A. J. Altenhoefer, who overlooks the most important correspondence, and appropriates all the English publications. Hebrew and Sanscrit are among his acquirements, and both he and his associates are thorough classical scholars, quotations from the Latin abounding in Continental writing. Their duties are confined to the correspondence and the literary department. Each has a private library in his comfortably furnished room, and the chief editor's numbers upwards of 7,000 volumes. His salary is $1,000 per annum, while a common school-teacher in Bavaria gets $142, and the principal of a normal school $340. The circulation of the paper is 22,000 daily. Its expenses last year were $56,400, of which the correspondents received $14,700, being paid at the rate of $3 50 for a page about equal in size to that of The Nation. War correspondents, however, got only $12 a week. All these figures must be compared with the dearness of living in this country as contrasted with prices in Germany. Our printers are paid fifty cents per thousand ems for their composition; the *Zeitung* pays its compositors 6⅔ cents per thousand; but in Munich the bookbinder will charge you twenty-five cents for work that would cost in New York at least ten times that sum. Every day, said one of the editors, enough correspondence is thrown into the waste-basket to fill five of the ordinary issues of the paper.

THE PHYSIOLOGY AND PATHOLOGY OF THE MIND.*

The human mind and its manifestations may be investigated in two very different ways. The one necessitates no knowledge of the structure of the brain or of the functions of its several parts, the other requires no acquaintance with metaphysical subtleties or the principles of thought; the one regards the mind as an abstract property common to all mankind, and pays no heed to the numberless varieties due to inherent differences in organization; the other takes it up as the resultant of certain functions the organs of which are tangible facts; the one has been followed by the greatest thinkers and philosophers the world has produced, the other has been trod by but few enquirers, and by them not in a manner to lead to the establishment of many enduring principles; the one has resulted in the foundation of a science which has apparently reached its utmost stage of development, the other has as yet scarcely approached the confines of true scientific enquiry. These two ways or methods are the metaphysical and the physiological. What have we to expect further from the first of these? As Dr. Maudsley remarks, Plato interrogated his own mind with a degree of wisdom and perception which no one since has been able to give to such enquiries, and in what respect has the science of metaphysics advanced since his day? Over and over again the same arguments and points have been stated with little variation, except in the degree of obscurity, each one thinking his own reasoning more perfect than that of his predecessors, and imagining that he was unfolding new truths which were to overturn all existing knowledge of mental phenomena. But as there is no other method for the metaphysician to adopt than that of self-examination, he must needs possess a mind superior to that of Plato before he can hope to bring forward a single principle which that great man overlooked. That there has been no such mind devoted to psychological enquiries is very certain, and hence it is that the science of metaphysics—the true, well-founded science—remains as imperfect as when Plato left it, notwithstanding the labors of the French, the Germans, and the Scotch, and the consequent production of hundreds of systems and thousands of absurdities. It was time, therefore, that an earnest and competent scholar, one who had not only made himself acquainted with the old way of investigating the mind, but who had likewise skilled himself in the knowledge of the structure and physiology of the organ of thought, should take up the study of mental science and investigate it from a more advantageous standpoint. That Dr. Maudsley is competent to this task, and that he has performed it in a manner to command the respect and thanks of all psychologists who desire the advancement of their science, is a question which we feel very sure the great majority of those who read his book will unhesitatingly admit.

Dr. Maudsley divides his work into two parts. Of these the first is devoted entirely to the physiology of the mind and nervous system—a very proper introduction to the second part—the pathology of the mind, which he evidently regards as the more important division of his subject. The first chapter treats of the proper method by which the mind is to be studied, and the advantages of combining the physiological with the metaphysical are forcibly urged. The author does not believe that the latter is worthless. He admits that it has been productive of grand results; but he thinks that very little is to be expected from it in future, and he shows how through it the most contradictory views have been advanced in regard to very obvious and simple mental phenomena. In his opinion, the true plan is for the student to make himself acquainted with the science of metaphysics as he finds it, and to bend his energies towards the study and further development of cerebral and nervous physiology. That he is right in this view we cannot doubt. To study metaphysics without at the same time endeavoring to acquire some knowledge of the brain, has always appeared to us a very short-sighted course. Metaphysicians have constantly shunned the dissecting-room. They have had a contempt for the contents of the cranium which they have not even attempted to disguise. They have been, and indeed are, deplorably deficient in the most rudimentary knowledge of the brain so far as relates to its anatomy and physiology. Let them take care that men trained in the observation of nature, familiar with the methods of experimental enquiry, quick to see the truth and deduce from it legitimate conclusions, do not drive them from a field which they with their antiquated processes can no longer cultivate to advantage.

The second chapter, on "The Mind and Nervous System," points out how intimately mental manifestations are related to the character and quality of the brain. We do not find anything very new or striking in this chapter. Whether the mind results from the action of the brain, or whether this latter is the organ—the tool by which the mind does its work—is a question not yet capable of being determined. It is very certain, however, that the brain does not, as Cabanis asserted, secrete thought as the liver secretes bile. Thought is an intangible power manifest only through its effects; but the bile is a very evident fact capable of being appreciated by all the senses. And yet there is an analogy between the mind and the bile, or any other secretion; for if the brain be a bad one, the mind will just as surely be imperfect as that if the liver or the pancreas be defective there will certainly be faulty bile or pancreatic juice.

In the third and fourth chapters Dr. Maudsley treats of the spinal cord and the ganglionic system. In these we find the actual state of the physiology of the subjects given with precision. Referring to the experiments which Pfluger and many other observers have performed upon decapitated frogs, the author does not find that the results obtained afford any evidence of the existence of a principle of consciousness in the spinal cord. And yet there are many who at the present day are more disposed to agree with Pfluger than they would have been ten years ago. The state of the question is simply this: It has been observed that if a frog be decapitated, and an irritating substance be applied to his side for instance, the animal endeavors with the foot of that side to remove the matter which causes it uneasiness. If the foot be cut off, it appears to be in doubt what to do; but, after a short time, it attempts to get rid of the irritation with the foot that is left, or else uses the mutilated limb for the purpose. Pfluger inferred from these facts that the spinal cord, like the brain, possessed sensorial functions; and Dr. Bennett Dowler, of New Or-

* "The Physiology and Pathology of the Mind. By Henry Maudsley, M.D., London, Physician to the West London Hospital, etc." American Reprint. New York: D. Appleton & Co. 1867.

leans, who has performed many analogous experiments on the alligator, agrees with him in this opinion. All such instances—and there are innumerable examples of them—are classed by Dr. Marshal Hall and the great majority of physiologists as reflex acts. They are regarded as being due entirely to the effects of an irritation transmitted as an impression to the spinal cord, and thence reflected through a motor nerve to a muscle: a movement accordingly results.

Whilst we are not yet prepared to admit the doctrine that the spinal cord is endowed with consciousness, and is thus able to take upon itself some of the functions of the brain, we cannot accept as correct all the arguments which Dr. Maudsley adduces against it. He says that the decapitated frog which has lost its leg acts as if the limbs were all there, which, were there intelligent consciousness, it plainly should not. We do not see the force of this view. Animals which have not lost their heads, but which have been deprived of part of a limb, will attempt to use the mutilated member in the manner to which they have become habituated. There can be no doubt that if a bee were to alight on the face of a man whose hands had been cut off, he would make the effort to dislodge the insect with the stumps. His action would not, therefore, be materially different from that of the decapitated frog to which reference has been made. He would act with his brain in full possession of its functions; the frog acts without a brain, but with a spinal cord. It is impossible for us to say, with any certainty, that if consciousness dictate the action in the one case, it is not also the excitant in the other.

Disease or disorder of the spinal cord or sensory ganglia gives rise to abnormal manifestations of nervous action, which may be the first phenomena of approaching mental derangement. Illusions, or hallucinations, as Dr. Maudsley prefers to call them, may be produced by many causes which interfere with the proper function of the ganglionic cells. Some of these causes are innate, others are acquired. Among the latter the most efficient are excessive use, and a condition of the blood, either as regards its quantity or quality, different from the natural standard.

In the fifth chapter Dr. Maudsley discusses the question of the origin of ideas. The opinion, based upon numerous pathological observations, that language is located in the third frontal convolution of the anterior lobe of the left hemisphere, finds no favor with him. In this view we decidedly agree with him; for, although it is true that, almost without exception, *post-mortem* examination has resulted in discovering disease in this situation in persons who have died whilst suffering from aphasia, and although it is also the case that almost invariably aphasic individuals are paralyzed, when at all, on the right side, showing disease of the left hemisphere of the brain, there *are* exceptions, and the theory is so contrary to sound physiological science that we cannot bring ourselves to its acceptance.

The doctrine of innate ideas is also discarded by the author. He holds, with Hobbes, that in order for an individual to have ideas it is only necessary for him "to be born a man and live with the use of his five senses." This division of his book is hardly, we think, considered with sufficient fulness by Dr. Maudsley. Instinctive impulses, which if not ideas are strongly allied to them, and which are clearly set in action without the medium of sensational impressions, are not even alluded to.

In the sixth chapter the subject of the emotions is discussed with much fulness and perspicuity, and Dr. Maudsley shows how intimately the pleasure or pain which we experience from certain feelings is dependent upon the physical condition of the brain and nervous system. All of us know that an idea which at one time causes us delight is at another period productive of the very opposite emotion. As he says, "It requires no very careful observation of men to discover that different persons are very differently affected by one and the same object, and often pass very different judgments upon it in consequence." That this diversity is due to inherent variations in the organizations of the nervous centres we cannot doubt, and hence we have a very important application of the physiological method to the investigation of mental phenomena. In incipient insanity the emotions are among the first elements of the mind to give evidence of abnormal action, and any change in their habitual current should always be regarded with great anxiety. We all have our accustomed types of emotional manifestation. We are either brave or timid, generous or niggardly, quarrelsome or slow to anger, imprudent or cautious, ambitious or unaspiring, or we are negative as regards these extremes and endowed with a mediocre but perhaps more happy cast of character. These or other qualities which we may possess excite in us corresponding desires or aversions which it is pleasant for us to gratify. They are as much parts of our organization as are our hands or feet, or heart or lungs, and if they give evidence of derangement they just as surely point to disease as though any one of the organs mentioned should take upon itself a morbid action. The proper regulation of the emotions and passions is one of the first duties of man. He cannot change them without changing his individuality, and this is impossible within the limits of health; but he can control them, and bring them under subjection to those higher faculties of his mind which place him so far above all other created beings. If he once allows them to gain the mastery, there is danger that a time will come when he will be powerless to assert his intellectual superiority, and when, either as an imbecile or a madman, the nobler elements of the mind will have given place to those which he holds in common with the brute creation.

The remaining three chapters of the first part of Dr. Maudsley's treatise are devoted to the consideration of volition, the motor-nervous centres, and memory and imagination. His definition of the will is, "The desire or aversion sufficiently strong to produce an action after reflection or deliberation." This is not, however, a very correct definition. Clearly the will is not either desire or aversion, but the power which desire or aversion sets in action. That it is dependent upon structure for its manifestations, and is not a mere ideal principle, is, we think, very certain. As the author remarks:

"When a definite act of will is the result of a certain reflection, it represents physically an available or a liberated force consequent on the communication of activity from one cell or group of cells to other cells or groups of cells within the cortical layers of the hemispheres. Any modification therefore of the condition of these centres may, and notably does, impede reflection and affect the resultant power of will—a power which, in reality, is seen to differ both in quantity and quality in different persons, and in the same person, according to the varying conditions of the nervous substratum."

So intimately is the will, as well as other faculties of the mind, influenced by the physical condition of the brain and nervous system, that even slight causes—such, for instance, as produce no permanent change of structure—are capable of effecting very decided changes in the mental phenomena of an individual. An indigestion, a fit of anger, a disappointment, a piece of good fortune, a fever, an empty stomach, with hundreds of other causes, so affect our judgments and our wills as to produce thoughts and actions which are to a certain extent abnormal, and which, in the even current of our lives, we should have shrunk from; and certain drugs produce such changes in the constitution of the blood circulating through the brain as to bring about mental conditions scarcely distinguishable from insanity. A drunken man has his illusions and his delusions; his judgment is warped, his will perverted, his emotions exaggerated or changed, and all this from the addition to his blood of a comparatively small quantity of a fluid capable of inducing a transient derangement of its normal condition, and a consequent alteration in the tissues which enter into the composition of his brain and nerves. Such facts as these teach us great lessons. They show that, whether in health or disease, the mind is to be studied from a purely material standpoint, and not as a mysterious principle to be looked upon with awe as something entirely beyond our reach. There is no one feature of cerebral action which we may not hope to understand. Books like Dr. Maudsley's encourage us to persevere in our efforts to investigate the secrets of our being. There is scarcely a page of it which is not marked by well-digested thought and cogent reasoning. If he succeeds in doing for the brain what physiologists and chemists have done in elucidating the functional actions of other organs of the body, he will have accomplished a measure of good with which he may well be satisfied.

And here we take our leave for the present of Dr. Maudsley's interesting and instructive treatise, with half its contents unconsidered in this very inadequate *résumé* of his labors. The pathology of the mind, to which the second part is devoted, is treated in a manner which our readers can readily comprehend from what they now know of Dr. Maudsley's views. Were we to dwell upon this section, we should be led into paths somewhat out of the way for the non-professional student to follow. Still, for those who take an interest in the subject of psychological medicine, and who care to examine into the great advances which have been made in this department of science during the last few years, we recommend a careful perusal of what Dr. Maudsley has written.

FRANCE, NORTHERN AND SOUTHERN.*

POSSIBLY more, probably better, champagne will be drunk because this book has been written. We are quite sure, however, that it was not published by the advice or with the approval of the wine manufacturers of Rheims, for whom Mr. Tomes entertains a sufficiently slight esteem, unmixed with envy for the disorders they have contracted in carrying on their lucrative business. Nor shall we be surprised if he is one day summoned as

* "The Champagne Country. By Robert Tomes." New York: Hurd & Houghton. Pp. 231. 1867.
"Glimpses of Southern France and Spain. By L. E. Mills." Cincinnati: Robt. Clarke & Co. Pp. 153. 1867.

a witness in the negative, in the important question whether vine culture ought to be encouraged in this country as a remedy for drunkenness. For he says expressly that though drunkenness is reputed uncommon in France, there is plenty of it in Champagne, the home of the vine; and, without a great deal of hard drinking, it is not possible that Rheims should be "the most corrupt city in the world." There is a solidarity of vices as of virtues, and that intemperance is a proper measure of licentiousness admits of little doubt.

Some astonishment is expressed in the preface that so few American tourists turn aside from the grand routes to visit Rheims; but, so far as the people and the wine manufacture are concerned, the author has furnished the pure-minded with excellent excuses for not going thither. Even the scenery of the suburbs, among the vine-growing hills, is uninteresting, and the only unalloyed satisfaction appears to lodge in the architecture and antiquity of the capital of the Remi. To explore the wine-cellars is about as agreeable as to explore a coal-mine. To "assist" at the vintage is to dispel the illusions of the theatre and the chromo-lithograph.

"It was a cheerful scene of labor," says Mr. Tomes; "but there was nothing in it to remind me of the many vintages I had beheld in the gas-light of the Comic Opera. I neither recognized the plumed cap, velvet doublet, pink hose, and silver buckles of my stage acquaintance, nor the elaborate coiffure, diamond cross-laced petticoat, the well-filled and extensively displayed silk stockings, and high, red-heeled little shoes of his sweetheart. There was no love-making, as far as I could see, and I certainly heard no one singing songs composed by Verdi and Donizetti.

"I saw nothing but a great number of coarse laborers hard at work. There was nothing in their dress to distinguish them from the same class in any part of the world. They were all in their working-day suits—the men in shirt-sleeves and straw or felt hats, and the women in tow-cloth petticoats and ugly coal-scuttle bonnets. There was great quietude and deep devotion to work. I could see that the laborers were in earnest, and it was not surprising, for most of them, being proprietors, were working for themselves. The only picturesque objects were the donkeys munching their food, with their noses in a bag—for there was no thistle or any weed, or even a blade of grass, at the roadside."

And later:

"Still beset with the memories of the opera-house, I asked if the day was not to close with the feast and dance, but I was answered that all were so wearied with their work that they would seek an early sundown repose in unromantic slumber.

"Towards evening, however, whether it was the effect of the vapor of the new wine which filled the atmosphere, or the drinking of the old which flowed freely everywhere, or merely the natural exhilaration which comes with the satisfaction of having completed a hard day's labor, I observed a growing excitement. Men and women were arguing loudly and energetically, and the rude swains were philandering with and kissing the 'sunburnt daughters of labor.'

"I found myself, too, becoming the object of a warmth of affection I would have preferred to have dispensed with. Brawny arms, stained red with wine to the shoulder, were wound about my neck, and stuffy hands sticky with grape-juice thrust into my grasp."

Some consolation, it may be thought, should be found in the rival manufacture of woollens; but the tidy figures of girls carrying great bundles of cloth through the streets are picturesque only. In all the townful there is not so much virtue as in the operatives of a Lowell factory. They carry greater burdens—these *rentreureuses*—than rolls of defective web, and, sadder than all, their parents connive at their infamy and share their gains. And the spirit of gain is eminently the curse of Rheims. Cobden's free-trade treaty has wonderfully stimulated the industry of the place, and made everybody a disciple of Bastiat; but it has also made everybody a confirmed imperialist, a contented subject of the Second Empire, with no aspiration for freedom, with no political thought, with no expression in speech or through the press. It is only amusing, as Mr. Tomes points out, to notice how the bottle aristocracy holds aloof from the aristocracy of the loom, and gets for itself titled alliances and mayoralties and a place in the Corps Législatif, and builds châteaux, and once in a while paints a picture in oils or writes an obscene book from excess of leisure. It is also curious to find in one quarter a colony of English cotton-operatives, helping France to surpass Great Britain in the flannel market, and importing their Methodist Church into the superlatively monkish and Catholic town; in another, a cork-cutting Spanish colony; and, in all the great champagne houses, the German partner, who is the real and indispensable manager of the concern, so that the author can say, "There is, in fact, not a single wine establishment in all Champagne which is not under the control, more or less, of a native of Germany." His explanation is worth reproducing. He says:

"I fancy that the French have a natural inaptitude for commerce. With an unquestioned superiority of taste, a precise attention to details, much thriftiness, an easy compliance, and a polite address, they make good workmen and excellent small dealers. Napoleon called the English a nation of shopkeepers. The saying in its literal sense is more justly applicable to the French. They are emphatically the shopkeepers of the world. Wherever the traveller goes he finds the Parisian *monsieur* or *madame* installed behind the counters of the confectionary, perfumery, millinery, and curiosity shops. It is so at Rio Janeiro, Lima, Valparaiso, and over the whole continent of America; but the Frenchman is rarely found in the counting-houses of those places. While he is the shopkeeper, the German, the Englishman, and the American are the merchants."

But we must close our quotations. In a book which does not contain a dull page, it is difficult to stop when one has once begun to make extracts. We commend the whole volume for its delightful admixture of amusement with useful facts, and for its not inconsiderable value as a study *ex uno* of all France and the French character.

If Mr. Mills had omitted to publish what he got from the guide-books and a few books of travel, his own observations would have occupied less than one quarter of the space he has actually employed, and he would then, perhaps, have seen how juiceless they were, and how little they could contribute to our knowledge. His progress is from cathedral to cathedral, and —what is not so wise, albeit quite as common a mistake in tourists and letter-writers—from dimension to dimension. Some friend to whom the manuscript was submitted should have reminded him that the cathedral is the *pons asinorum* of travellers, and that not one in a hundred can handle it so skilfully as does Mr. Tomes in the case of the *chef d'œuvre* of Rheims. In a word, we do not say that there is nothing to be learned from his book; but it is sometimes inaccurate, colorless throughout, and too little novel to justify its appearance.

MAGAZINES FOR AUGUST.

NOTHING new or striking, for *The Atlantic*, appears either in "The Guardian Angel" or "Poor Richard" this month. Miss Eudora Clark contributes a paper of reminiscences of hospital life, a kind of literature of which we have, since the war, had a great deal, but of which we do not think we can well have too much, as we are satisfied that every sketch of this kind will grow in value as the years roll on. The same thing may be said of Mr. Higginson's "Up the Edisto," which is a pleasant and picturesque account of one of the many fruitless—from a military point of view, but from a moral and political one, very fruitful—expeditions up the Southern rivers on the eastern coast, in the earlier part of the war. Mr. Whipple's article on the "Growth, Limitation, and Toleration of Shakespeare's Genius" discusses the evidence afforded by the poet's works as to the character of his individuality, the extent of his insight, sympathies, prejudices, his way of looking at religion and religious people, and contemporaneous social phenomena. There is nothing striking and not much that is new in the paper, but it is full of suggestiveness and sets a good many points in a light in which readers of Shakespeare do not often see them. "A Week's Riding" is a capital specimen of the throwing together of old materials. A fine old English gentleman tells before a winter's fireside how he went down in his youth to stay at the house of the last of the fine old English yeomen, just after being badly jilted by a London flirt, the daughter of a fine old earl; how he found, in the fine old farm-house, a fine tall girl, with glorious Saxon fair hair, mending fine old saddles in the sitting-room, and generally occupied with horses, doing her sewing a good deal in the stable; how she was a perfect lady nevertheless, and how he fell madly in love with her, rode a fine old horse madly across country with her for exercise, and then agreed to ride a glorious roan colt for her at a fine old-fashioned country race; how he rode this race in the presence of the fine old county gentry, bringing the colt in winner by several lengths amidst the applause of the aristocracy; how the London flirt, strange to say, happened to be on the ground, and at once sought to take him up again, but how he declined to be humbugged again, and offered himself to the owner of the roan colt, and was refused; and how, being weak, he finally married the London flirt, who, before long, went mad as a hatter, and left the fine old English gentleman alone in his old age in his fine old English home. We hereby give notice that this plot, and all modifications of it, are now used up and must be laid aside.

By far the most interesting paper in the number is Bayard Taylor's account of the Canton of Appenzell, at the "Landsgemeinde," or cantonal election of which he was present—a curious and interesting spectacle—the voters carrying swords, because the law required them, in accordance with mediæval custom, to come armed—and dressed in black, with stove-pipe hats, because the law required them to be respectably dressed. We do not remember to have anywhere seen a better account, in a small space, of the working of the Swiss democracy, the most interesting and picturesque democracy in existence, owing to its mediæval coloring. He records one curious incident—his meeting with two well-educated men, discussing the classics in patois, and unable to speak or understand pure German. Mr. Parton describes "Cincinnati"—another Western city—with its excellent municipal government, a great deal of wealth, a rising taste for literature, much

smoke, an enormous commerce, fine villas, a charming cemetery, disgusting theatres, a laughable museum, great manufactories, a flourishing book interest, lots of hogs, much wine, and large numbers of liberal and enlightened Jews. We mention these phenomena in Mr. Parton's order, and not in our own. The book notices are, as usual, good, one of them being an obituary notice of Mr. Ball, "the poet," *quâ* poet. The number is, on the whole, entertaining but not brilliant. There is nothing in it except "The Week's Ride" that is not good, but nothing that is very good.

The weightiest name on the list of *Hours at Home* is that of Dr. Bushnell, who takes up a seasonable division of his subject, "The Moral Uses of Dark Things," and, after showing how other theologians, to whom musquitoes have been a stumbling-block in the argument from final causes to a beneficent Creator, have attempted to make these and other "animal infestations" ministers of vengeance or ministers of good, concludes that they "are appointed to serve grand purposes of benefit in the moral training of souls." This they do partly by showing us that God is not constantly concerned about our happiness, and partly because they admirably symbolize our sinfulness.——Rev. D. A. Wilson furnishes a readable paper on Sierra Leone, and notes the remarkable aptitude of the Africans for language. — Professor Wells treats of "Brazil and the Amazons," and speaks of the extensive colonization of Germans in that and the adjoining countries of South America. He alludes to the hard fate of many of these colonists in Brazil, and perhaps could have told, if he had chosen, how that emigration was brought to an end, what connection existed between the subsequent diversion of German settlers to Uruguay, and the present war on the Plate, and what part slavery in Brazil, by turning the Germans also to the United States, had in overthrowing slavery at the South and shortening its own term of existence. The writer corroborates the remark of Mr. Tomes that the French are by nature shopkeepers, and in that capacity abound in Rio Janeiro and other South American cities.——Dean Alford is warmly, and, as we think, somewhat indiscreetly, defended in the article on "The Queen's English and Brother Jonathan's." The writer's observations on the Yankee pronunciation and enunciation will appear less startling if we reflect how much this running together of words is practised in all languages. "So am I" was once vainly searched for in the dictionary by a Frenchman, under the spelling "somi"—a common enough contraction even outside of New England.——Dr. Van Santvoord writes well of "Nashville during the War," and gives some statistics of the national military cemeteries there which, more than any others we have met with, have helped us to realize the enormous sacrifices of the North. ——We recommend the author of the verses, "Grandma is Dead," to read Victor Hugo's ballad on the same theme.

If we may trust a medal, struck "grato animo," in 1846, in memory of "Henrico Pestalozzio, concivi immortali," born just a century before, Mr. Gardette has given the Swiss one *l* too many in writing of "Pestallozzi in America," in the August *Galaxy*. The title must be understood to refer only to spiritual presence—in which sense it would have been just to have written, "Rousseau in America," since, if Joseph Neef was a disciple of Pestalozzi, his master was in turn a disciple of the citizen of Geneva. The whole paper is well worth reading, and its unexpected relation to Admiral Farragut enhances its interest. One may be sure there was nothing impracticable about a teacher who could confess, "the education of children and rearing of vegetables are the only occupations for which I feel any aptitude."——Mr. Winwood Reade, who does double duty this month in the magazines, gives here some account of "London Amusements," in which, with a dig at Du Chaillu, he contrives to say a good many hard things of his countrymen, and to describe some disreputable places of resort, along with the Derby and the Italian Opera. The latter "is, without comparison, the best in the world;" and the buffoonery of the workingmen who attend the former "is of the grossest description—so much so that it is impossible to take a lady to the Derby."——Sophie May has hitherto, we believe, addressed chiefly "our young folks," but she essays here to persuade adults that the theory of marriage laid down in Gail Hamilton's "New Atmosphere" is too exacting in respect of affection. This would, perhaps, have been easy if she had resorted to simple argument; but she has chosen a fiction with a moral, and having allowed herself too little space for the development of so large a "motive," she makes a very bald failure.——Some one vindicates Walter Hunt's claims as against Elias Howe and Mr. Parton, in the enquiry, "Who invented Sewing-Machines?" The case is strongly put from the Singer point of view; and since we hint at partisanship, let us say that the writer is justified in asserting of Mr. Parton's article in the May *Atlantic* (with reference merely to appearances), that "its tone was that of an article written expressly to promote the pecuniary interests of Mr. Howe, and [so far] in opposition to the interests of the public."——In a retrospective discussion of the Pacific Railroad, Mr. Church recovers another personage for the honors of history—Mr. Asa Whitney, who first "talked up" the scheme, and has been forgotten.——We extract from Miss Olive Logan's article on "The Leg Business," which means ballet-dancing, the following excellent sentiment: "A woman should have her destiny in her own hands as completely as a man has his, and the first boon that should be vouchsafed her is the happy knowledge that, before she lies down at night, she may really thank her Maker, and not her husband, for having given her this day her daily bread."——We sympathize entirely with Mr. White's aversion to the practice of *The Evening Gazette* in "gossipping" about public characters and advertising the next victim in advance. We were, therefore, grieved to meet, after reading his strictures, this announcement: "A sketch of Richard Grant White (writer of the 'Nebulæ' in *The Galaxy*) will appear in an early number of *The Gazette*." But he ought to drown his annoyance in the satisfaction of having done his best to persuade the public-spirited to purchase Mr. Jarves's Gallery of Early Italian Pictures, which has gone begging too shamefully long, and is in imminent danger of being sold to Europe.

The best article in *Harper's* is that on Port Hudson, better than "Porte-Crayon's" account of the Cedar Mountain fight, although the latter is illustrated. Both involve the generalship of Mr. Banks. The other illustrated papers are "The Dodge Club," which is excessively humorous, and "The Turks, the Greeks, and the Slavons," which is excessively dull, being poorly condensed from a rather lean book of travels; so that the writer's satisfaction at the close for the information obtained seems to be purely personal or else ironical. But perhaps he is satisfied with little.——"Mr. Gregory" is a local story about the trials of a young schoolmistress in this city; but she ought to have been forced to purchase her situation to give the last touch of reality to the narrative.——In spite of the well-handled conception of the "Reformed Ring-Man," we doubt if any one ever recovered from an attack of the "Ring."——In "What shall they do to be Saved?" a physician exposes the lamentable consequences of opium-eating, warns the young against the habit, and points out, with scientific but awful exactness, the chances of recovery for those who repent and would fain be rescued.

The only controversial articles in *The Catholic World*, and almost the only original ones, the poetry excepted, are "Guettée's Papacy Schismatic," "The Indissolubility of Christian Marriage," and "Playing with Fire"—in which last the conduct of the preacher Murphy at Birmingham, and all pretexts for religious mobs, are properly censured. There is the usual entertaining variety of selections, from Lady Herbert's "Impressions of Spain" to an article on "Thermometers" from *Chambers's Journal*. Indirectly from Montalembert, whose "Monks of the West" is reviewed among the literary notices, is derived an account of the Irish saint Columba or Columbkill, and a brief mention of another more famous is contained in the article "Solution of some Parisian Problems." St. Fiachra, having had his effigy placed on the front of the inn of Nicholas Sauvage, who also kept a livery stable in Paris about 1650, is the veritable ancestor of the modern *fiacre*. An article from the *Revue des Questions Historiques* rightly exonerates Vespuccius from the charge of stealing the glory of Columbus, and names, after Humboldt, the map-maker who invented the name of America, Martin Waldsee Müller, or Hylacomylus. The full history of this controversy may be found in the "Bibliotheca Americana Vetustissima."

There is hardly anything worth mentioning in *The New Jersey Magazine* except the paper on "The Inner Life of the House of Commons," which is fresh and accurate, and altogether good.

NOTES ON THE NEW EDITION OF WEBSTER'S DICTIONARY.

XVIII.

Coach. The historical evidence points to Katce or Kocs, the name of a town in Hungary, as the origin of this word. See the note in the American edition of Wedgwood, p. 186. Further evidence on this point may be found in a volume entitled "Dell' origine e dell' uso dei Cocchi," by Count Giovanni Gozzadini, published at Bologna in 1864, from which it appears that the coach, then known as the *Ongaro*, or Hungarian, was introduced at Ferrara, certainly not later than the year 1509, by Cardinal Ippolito d'Este, who had been bishop of a Hungarian diocese, and was the nephew and heir of Beatrice of Aragon, queen of Hungary. The facts stated by Gozzadini seem decisive. The Rev. Isaac Taylor, in his learned "Words and Places," p. 448, *note*, refers to "two most exhaustive treatises on this word by M. Cornides in the Ungrisches Magasin," Vols. I. and II. I have no opportunity of consulting these articles, but I believe they lead to the conclusion arrived at by Gozzadini.

Cold-short, applied to iron which is brittle when cold. This word is sometimes pronounced and written cold *sheer*, or *shear*, cold *shut*, and the last element in *red short* or hot-*short*, brittle when heated, is varied in the same way. It is evidently the same word as *short* in pastry-cookery, meaning crisp or brittle, *short* cake, *short* crust. Although *short*, in all its different senses, may be from one and the same primitive, yet, as is shown by the history of the corresponding word in the Scandinavian languages, the two significations have been differently developed, and it is not improbable that our *short*, brittle, is borrowed from the Swedish or Danish. In the metallurgical industry of the Scandinavian countries, *kallt skört*, *kold-skjört*, *röd-skört*, *röd-skjört*, have been used from time immemorial, and similar forms are found in the Platt-Deutsch dialects, while in all those languages *short*, in the familiar sense, is without the initial *S*, which seems to have been first introduced in Anglo-Saxon, *sceort*. I do not find, however, that the A.-S. *sceort* had the sense of *brittle*. The adjective does not occur in Old Northern in either form or signification, but the verbs *skera*, *skora*, to cut, divide, break, are found in that language, and the Lat. *curtus*, whence Ital. *corto*, Fr. *court*, seems to be an allied word.

Commander. This word, one in form, has a double origin and signification. In its familiar sense of one who *commands*, it is a noun derived from the English verb *command* by the ordinary process of adding the terminal *er*. In its meaning of a certain charge, in a religious order of knighthood—a sense not given by the editors of Webster under *commander*, though indicated under *commandery*—it is derived from the French *commandeur*. In the first signification this noun is active, in the other passive, being applied to persons to whom an estate called a *commandery* is committed or *commended* in trust for the use of the order to which he belongs. The two significations are etymologically, but not logically, connected; the one not being deduced from the other, but both independently from a common origin.

Commodore. This word is referred to the Ital. *commendatore*, Sp. *comendador*, as a probable source. These Romance words are of the passive class, meaning originally one who holds a *commandery*, not one who *commands*, nor have they the signification of *commodore* at all. It might very naturally happen that a knight of Malta, who held a *commandery* of his order, should have the *command* of a naval squadron, and Englishmen, ignorant of the meaning of *comendador* may, in such case, have taken it for the designation of a naval rank, and introduced it, in a corrupt form, into their own language. But this is no better than a mere *guess*, which is worth nothing without proof. If the signification of the source is to be regarded, the Portuguese *capitão mor*, which, as I have elsewhere suggested, exactly corresponds in meaning to *commodore*, furnishes a better etymology.

Corfute, a native or inhabitant of Corfù. I cannot say that this appellative may not have been employed by somebody, but the regular word is *Corfiote*.

Cross. } These words and their immense family of compounds and
Crutch. } derivatives furnish a good illustration of the way in which
Curse. } particular incidents, connected with the moral interests of humanity, often give great prominence and variety of application to words which otherwise would have been forgotten when the objects they express have fallen into disuse. Simply as the name of a barbarous implement of punishment inflicted by the Romans and other cruel nations of the ancient world, *cross* would hardly have become the stem of a great multitude of words of very diversified and important significations both literal and figurative. Whether *crux* has any etymological connection with *crudelis*, *crudus*, *cruentus*, *cruor*, etc., may be doubted; but the Romans do not seem to have felt the possible alliance between them, and they formed but a small number of derivatives, mostly literal in sense, from *crux*. But when the *cross* became familiar as the instrument of the death of the Christian Saviour and the symbol of Christianity, it assumed at once a great etymological importance, and hundreds of words, some of them but remotely resembling the Latin *crux*, are now traced to it as their proximate or remote original.

Cur, referred to German *Köther*, a peasant's house-dog. The O. Dutch *korre* gives some countenance to the supposition that this is a Gothic word, but the historical evidence is in favor of the supposition that it comes from *curtail*, persons not qualified to hunt by the laws of England, and, perhaps, other countries, having been formerly required to dock or *curtail* (*court tailler*) the tails of their dogs. See *curtail dog* in Webster.

Currier. } I have investigated the history of these words at some length
Curry. } in a note in the American edition of Wedgwood. There is little or no doubt that *currier* is from the Latin *coriarius*, and *curry*—to dress leather—may be from the same root, though this is by no means certain. *Currier*, a leather-dresser, appears to be older than the verb to *curry*, and it is difficult to doubt that Wycliffe first introduced the noun directly from the *coriarius* of the Vulgate. I find no earlier example of the verb than the participial form in the "Promptorium Parvulorum," p. 110, "*Curragyñ* horsys, or other lyke, strigillo," "*curragyñ* leder, cociodio."

The verb to *curry*, in the sense of dressing a horse, is certainly from the French *conréer*, as is abundantly shown by the examples I have cited in my note in Wedgwood. Several others are referred to in Müller, Mittelhochdeutsches Wörterbuch, under *kunriere*. There is no reason to believe that *conréer* is from *corium*, though my citations prove that this verb was sometimes applied to the dressing of leather at a very early date.

The editors do not explain the origin of the popular phrase, "to *curry favor*," which is properly stated by Wedgwood. It is the translation of a French proverbial expression, *étriller Fauveau*, to *curry Favel* (for this is the original English form), *favel* meaning a chestnut-colored horse. The French say, "Tel étrille *Fauveau* qui puis le mord,"—the ungrateful jade bites him that *curries* her. The third number of the seventh volume, 1866, of the "Jahrbuch für Romanische und Englische Literatur" contains an old French poem of the beginning of the fourteenth century, entitled "Le Roman de Fauvel," or, "Lignage de Fauvel, Satyre contre le Pape," etc., in which, or in some other old satire of the same character, the origin of the phrase is to be found.

Shakespeare, Henry IV., Part II., V. 1., employs the verb *curry* in what must be an abridged form of the proverbial expression, "I would *curry* with master." This use of the word is not noticed in Webster.

G. P. M.

The Results of Emancipation in the United States of America. By a Committee of the American Freedman's Union Commission. (New York; July, 1867.)—This month there meets at Paris an international anti-slavery conference, whose projectors having solicited reports on (1) the slave-trade, (2) slavery, and (3) the results of emancipation, the commission named above responds with perfect propriety, and with an authority which cannot be questioned, upon the third subject of enquiry. One does not report to a public meeting details which would make a volume, and this pamphlet has, accordingly, nothing in point of thoroughness or of bulk in common with the admirable work of M. Cochin, which it recalls by its title. A few pages of statistics, to be read rather than recited, are furnished by the committee to relieve the simplicity of their résumé, which, for breadth of view, methodical arrangement, and accuracy of statement, has, perhaps, never been equalled in the same compass by any previously attempted sketch of the transition from slavery to the *status quo* of civil equality and educational development. It swiftly passes in review the history of emancipation as a military and political movement, the legal and social condition in which the negro was left by emancipation, the instrumentalities—voluntary and governmental—employed for the improvement of his condition, and, finally, what has been achieved by them towards providing for his physical wants, securing him impartial justice, reorganizing labor, and providing education.

Such a document cannot fail to impress deeply the minds of those to whom it is specially addressed, and does not need the weight which the signatures of Chief-Justice Chase and Major-General Howard lend to it. The Sanitary Commission has justly taken a prize at the Paris Exhibition, and has equally shed honor on the United States and light on the American character. Compared with the Freedman's Commission, however, its aims must be confessed more restricted, more akin to the common feeling of humanity and human relationship, and therefore more naturally spontaneous, while having every attribute of popularity, and elevated beyond reach of party odium or party hatred. The Sanitary Commission naturally ended with the end of bloodshed—of the warfare between army and army; the Freedman's Commission will terminate, by self-limitation, with the warfare of civilizations—whenever the only guaranty of republican government is established unshakably where slavery flourished. Its object does not appeal to enthusiasm, but to reflection; it does not touch the family chord, nor rouse the sympathies by tales of physical suffering; it is not exempt from the disfavor of the fashionable and the enmity of a numerous and yet powerful party. The movement to educate the freedmen is really political, but partisan only because to be republican is, in the United States, to be partisan; but as it is conducted from disinterested motives, by honorable, usual, and approved means, and as it consults the ultimate welfare of the entire country, it should receive the support of every citizen who to national pride joins faith in the institutions of his country; and to him we cordially commend this pamphlet.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

THE NEGRO'S CLAIM TO OFFICE.

Men who say a great deal and are fond of startling effects must needs sometimes say things that it is not very easy to make good in calm discussion. Mr. Wade and Mr. Phillips have of late both got into difficulty owing to their having, in their eagerness to be in the advance ground of radicalism, taken up positions which it was easier to occupy than defend. Mr. Wade startled the world a few weeks ago by some rather confused talk about the duty of the Government toward the laboring classes, and as his discoveries were not favorably received by the public, detachments of newspaper correspondents had to be sent to his rescue to disengage him from the unbelievers. Mr. Phillips also having secured all the objects for which he labored for thirty years, began to find himself rather hard pressed for congenial occupation, and has accordingly begun to agitate for the election of a colored man to the Vice-Presidency. The public having received his arguments on this subject with irreverence, not to say with hilarity, and there being some indications that he has advanced too far, detachments of his friends are also coming to his rescue. *Harper's Weekly*, accordingly, undertakes to show, last week, that it is by no means "absurd" to claim the Vice-Presidency for the colored people, and that the election of a colored man to office will be the only sure sign that the caste feeling has died out with regard to negroes, and that therefore "we should labor for their election to office both as a sign and as a help." That is to say, by electing negroes to office, we shall help to destroy the prejudice against them, and at the same time furnish proof that the prejudice has ceased to exist.

This view of the case is, it seems to us, based on a false impression of the cause of the prejudice against colored people, as well as of the principle which should regulate the bestowal of public offices. This prejudice is not confined to the United States; it exists in a greater or less degree all over the Western world. It exists in almost as great a degree in aristocratic circles in England as in Southern circles in this country; it is nowhere stronger than in white circles in Jamaica, where the negroes have been free for nearly forty years, and have filled almost all public offices, and figured at the governor's levees, and dined at his table, though we admit it rages nowhere with such virulence as amongst the Anglo-Saxon race. Nor is the African race the only object of it. Hindoos and Chinese are exposed to it in almost the same degree. The contempt with which the average Englishman regards the Hindoo can hardly be surpassed by anything which the negro has in this country to undergo from the most besotted Democrat; and yet the Englishman has seen the Hindoo in all the pomp and pride and circumstance of royalty, and of every other great office; he has seen him serve gallantly in war, and knows him to be acute, refined, and descended from ancestors who, if their glory differed from European glory, were, nevertheless, glorious. Hindoos now are admitted to every department of the government service, sit on the bench, practise in the courts, and yet nobody will say that their official dignities have done much to raise them in the estimation of Englishmen. What they have done is to raise England and Englishmen in the estimation of Hindoos.

The dislike of Englishmen and Americans to colored people, and their unwillingness to admit their equality, is not due simply to difference of feature, or color, or race, but to difference of feature, color, and race combined with apparent want of mental, moral, and physical vigor. People whom an Anglo-Saxon can "lick" easily he never respects, and cannot readily be got to respect. The Indian is as repulsive in appearance as the negro, and less capable of civilization, and yet, during all the earlier period of American history, an admixture of Indian blood in one's veins was considered as something to be proud of; and it will be observed that this feeling has declined, and the Indian has fallen into the contempt which at present surrounds him, in the ratio of the decline of his powers of mischief. When he was capable of putting the scalps of a whole colony in danger nobody greatly objected to having a squaw for a grandmother, but since he lost his power of taking scalps at all, nobody likes to acknowledge relationship with him. Taking scalps, to be sure, may not *per se* be a remarkable indication of anything but ferocity and cunning; but the power of combining and carrying on a destructive war does indicate considerable power both of mind and body. Now the disability of the negro in the eyes of American society is due to the fact that he has never done anything which was an evidence of great capacity. He has never achieved wealth, which, in an Anglo-Saxon community, is the greatest evidence of power, and he has achieved neither literary, nor scientific, nor *military* distinction. That he has never had a chance to do so it may be easy to show; but society, in judging people, does not take opportunities or want of opportunities into account. Its decisions are shaped simply by accomplished results. When a man talks to it of what he might do if he had a chance, it laughs and leaves him. The only field in which the friends of the negro have been as yet able to produce strong indications of capacity superior to that of white men, is that of art; but it is only very recently that Americans and Englishmen have begun to look on painters or musicians or actors as anything better than vagabond adventurers of whom the community would be well rid.

We hold, therefore, as we have once before said when discussing this same subject, that the removal of the white prejudice against the negro depends almost entirely on the negro himself. You can work sufficiently on the religious and moral feelings of the white community to secure for him justice and political equality, and a fair chance in the race of life; but as long as the great mass of negroes—in fact, the whole colored population *as a class*—are in a lower state of civilization than the rest of the population, less learned, less wealthy, less cultivated, less refined, less progressive, have, in short, achieved less in every walk of life, it is chimerical to ask the white majority to bestow on negroes, as a class, special marks of honor by selecting a colored man for the Vice-Presidency or other high office, simply *because of his color;* and yet, as we understand them, this is what Mr. Phillips and *Harper's Weekly* ask us to do.

The right of negroes, *as negroes*, to seats in the State legislatures and in Congress we do not question; nay, we assert it, because in the existing state of society in this country negroes can only be fairly represented by negroes. The admission of colored men to the representative body, as long as a sixth of the population are colored, and are separated in feeling and antecedents and condition by a wide gulf from their white neighbors, is not the bestowal of an honor, it is an act of justice. But the election, by the whole Union, to a high Federal office, of a colored man for the sole reason that the fraction of the community to which he belonged was poor and mean and despised, would, in our opinion, be a degradation and perversion of the office, and would not help the colored population, because it would outrage the sense of justice and sense of propriety of the best portion of the whites. There is something very amusing in the simplicity with which Mr. Phillips tries to persuade himself and persuade others, that as soon as people saw a negro foisted into the Vice-Presidency by political manœuvring, the whites would begin to respect the colored population more than they had previously done. He might as well talk of regulating the temperature by forcing the mercury up and down in a thermometrical tube. Election to office is, and always has been, and we trust always will be, the result of the popular estimate of a man's character, not the cause of it. Therefore, whenever we see a negro in the Vice-Presidency, it will, we admit, be a *sign* that negroes, as a class, have risen in popular estimation. But to raise them in popular estimation, we must go about exhorting them to do the things and lead the life which win popular esteem, instead of exhorting the whites to bestow highest honors or their gifts on the class which has done least to deserve them, or to bestow the most important political trusts on the class which has done least to prove its fitness for them.

The offices of government, as we understand government, are established for the service of the whole community, and not for the consolation of the unfortunate or unsuccessful, and if there be one political abuse from which, more than any other, the country has in these latter days suffered, it is the practice of bestowing nominations and appointments with reference not to the candidate's fitness or to the public needs, but with reference to such arbitrary and senseless considerations

as "the claims" of particular sections or localities or interests. It is to this abuse of its power by the convention that we owe our present valuable ruler, Andrew Johnson, and it is to this abuse of their power by the President and Senate that we have owed and do still owe most of our worst diplomatic officers, and many of the worst in other branches of the public service. It is to the idea, too, out of which this abuse springs —that offices are "spoils" or prizes and not trusts—that we owe much of the jobbing which marks the election of United States senators. Many a valuable man is lost to the Senate because some one section of a State has "claims" involving the choice of somebody else. To this abuse Mr. Phillips wants to give an immense extension.

It is said that the arguments now used for the election of negroes to high office are such as have been and are constantly used in favor of the election or appointment of persons belonging to other despised or unfortunate classes, or interests. We deny it *in toto*. During the long contest in England which preceded the admission of Jews to the House of Commons, nobody ever thought of claiming seats for them as a means of raising Jews in the popular estimation. This work the advocates of their claims well knew the Jews must do for themselves. What was demanded in the case of the Jews, as well as of the Irish Catholics, was the removal as an act of justice of all legal barriers to their holding office. The moral and social barriers they were left to remove themselves by the ordinary means—that is, by industry, learning, energy, activity, eloquence, and public spirit. Baron Rothschild got his seat in the House of Commons not as a means of elevating his race, but because his race was elevated; because it had shown itself in every country in Europe foremost in the work of civilization; because its members were the first in the ranks of commerce, literature, arts, and arms, and because, in short, it had become ridiculous and absurd to exclude a Jew, as Jew, from any post of honor. The mere social prejudice against Jews is still strong in every Christian country—stronger with many people than the prejudice against negroes—but as long as Jews are amongst the wealthiest merchants and bankers, the ablest lawyers and scientific men in the world, no prejudice can shut them out from more than their share, calculated on numbers, of political honors.

The foreign population in this country is more numerous than the negro population, and has contributed far more to its wealth and strength and fame and prosperity. Foreigners are found in the most distinguished places in all walks of life, but how many foreigners are there in Congress? What foreigner has yet been nominated for the governorship of a State or the Vice-Presidency? Two or three have filled second-rate embassies; but, so far as we know, no high official position has yet been conferred by the popular vote on a man of foreign birth, and we have yet to meet with a foreigner who is fool enough to complain of this as a grievance or as an indication that foreigners are treated as "political outcasts." The exclusion is a natural one, and because natural perfectly just. As long as native Americans do most of the brain work of the country, have most to do with the supply of its ideas and the direction of its industry, the high political positions will fall to their lot. If the day should ever come when high political positions shall be distributed, as treasury clerkships and custom-house places now are, as a mode of relieving or encouraging the helpless or friendless or destitute or incompetent, a serious blow will assuredly be struck at the stability of the government, and we, for our part, hope that nothing of the kind will ever be submitted to by the people either for the sake of the negroes or any other race or tribe, because we know that when negroes have contributed their fair share to the work of civilization and good government, no prejudice can, in a free Christian country, prevent them from receiving their fair share of the prizes.

THE POLITICAL VALUE OF GOOD INTENTIONS.

If we may judge from the letters we occasionally receive from correspondents touching our manner of dealing with public men, and, in fact, concerning our whole theory of political criticism, a great many excellent people can only account for hostile or unfavorable criticism of men whose intentions are good, and whose services have been valuable, or whose reputation, whether their intentions be good or bad, is of value to the party to which they belong, when it appears in a journal which professes to have high aims, by ascribing it either to undue devotion to intellectual considerations, and consequently undue neglect of moral ones, or to a mere love of fault-finding. One correspondent asks us whether "great intellectuality and a certain kind of refinement may not exist with but little real moral development or little knowledge of what is required to attain it?" The obvious answer to this is, yes; this particular combination resulted in Napoleon Bonaparte amongst rulers; and very remarkable instances of it might be cited by the score from the annals of literature and science and theology. But this question is of very little value by itself. To give it any pertinence for the purposes of this disoussion we must ask the converse: Whether considerable moral development, or, in other words, a very highly cultivated state of the conscience, may not exist with a low state of the intellect? To this the answer must also be, yes. This particular combination has been even commoner than the other, and it has produced fanatics and persecutors and tyrants and blunderers by the thousand, who have probably inflicted more injury on mankind than all the ordinary criminals, intellectual or non-intellectual, the earth has produced. To it the world owed Philip II. of Spain, and James II. of England, and Arboes, the Spanish inquisitor, who was canonized the other day at Rome. But the end of all political criticism, which professes to have any end beyond the critic's personal gratification, or the infliction of pain on others, is the promotion, in statesmen, of as near an approach as possible to equilibrium between the mental and moral powers, and the maintenance in the public mind of a fair appreciation of the necessity of this equilibrium, in order to produce good government.

The course of events in America, for the last twenty or thirty years, in our opinion, has been such as to bring the moral qualities of public men into very high esteem, and make intellectual ones seem of very little account. The country has just emerged from a struggle which was, perhaps, more nearly a purely moral struggle than any in political history. The question involved was, whether it was right or wrong, wise or foolish, that the powers of a great government should be used to assist in retaining four or five millions of human beings in the condition of beasts of the field; and the circumstances of the case were such that the wealthy, the intellectual, and a large proportion of the professedly religious people, not of the United States only, but of the world, were ranged on the side of the wrong. What was needed to keep the struggle up was not clear brains so much as valiant hearts; not learning or experience so much as pluck and tenacity, sympathy with humanity and hatred of oppression. The result was that people came to look upon fidelity to the anti-slavery cause, and a generally philanthropic tendency, as the one test of statesmanship, and under cover of this feeling a large number of gentlemen have won their way to places in public life, which we will not say they did not deserve, or which, as the country was then circumstanced, they were not the right men to fill. What we do say is, that the circumstances have so changed, and the problems presented for solution are now so different, that they are fit to fill them no longer.

Moreover, during the last thirty years the spread of democratic ideas, both here and in Europe, has naturally given humanitarian feelings an immense impulse. The good things of the world have been so long reserved for the high-born few, that the spectacle of the low-born many entering or enjoying them gives immense satisfaction. The spectacle of human faculties exerting themselves without trammel or hindrance from law or social usage also gives immense satisfaction, and it is only in the United States that this spectacle is to be witnessed in anything like perfection. The consequence is that the sympathy, pure human sympathy with one's fellow-men as men, has received a development in this country such as it has received nowhere else. Nowhere else is there as much disposition to help the unfortunate, as much readiness to rejoice with the successful, as much reluctance to bear hardly on the stupid and ignorant, or even the criminal, or to exact of anybody more than he finds it convenient to give, or to pass harsh judgment on anybody's errors or shortcomings. Nowhere in the world is "the poor devil" so sure of a "chance," so sure of oblivion for his follies or recognition of his efforts to amend. Nowhere, in short, is society so pervaded by the spirit of good nature—genuine, hearty good nature.

Now, good nature, like many other good things, may exist in excess, or it may be allowed to act at wrong times and places; and when it is allowed to affect the public judgment as to the qualifications of public servants, or as to their manner of doing their duties, it may work infinite mischief. Ask any officer of sufficient cultivation to be able to look objectively at the system of which he forms a part, or anybody who had much to do with the working of the Sanitary Commission during the war, or any one who has had much experience in the work of administrative and social reform, what he has found to be the greatest obstacle to efficiency, to the prompt and punctual discharge of duty, to the promotion or employment of good men, to the eradication of abuses and malpractices, and he will tell you almost invariably that it was the unwillingness of everybody to complain of anybody else or hold anybody to a strict account, or, in short, be in any way disagreeable to anybody for any reason whatever.

The result of the working of these two influences combined on the popular mind is very curious. If you say of a member of Congress that he has displayed gross ignorance of political economy, of history, and of most things which a legislator ought to know, you are told that he has for years been the friend of the black man, or that he is kind to his wife and to the poor, or sets a good example in regard to total abstinence. If you say that he has been making a demagogical speech tending to confuse the ignorant, excite false expectations and false notions of the powers and duty of government, you are told that he is a "self-made man," that he never had any schooling, but learnt all he knows over the fire in the evenings, and spent many years of his youth as a day-laborer; and these things are put forward, not as excuses or by way of palliation, but as positive merits, which make your criticism improper, if not foolish, and you are probably accused in your turn of placing a low estimate on moral development, and of want of sympathy with the poor.

Now, at the risk of being accused of talking Buckle, we assert that ignorance or "small intellectuality" is, in politicians, immorality; that, in short, their blunders are nearly all crimes, and that God has so ordered the world as to make mind as necessary in governors as even conscience, inasmuch as He has so ordered it that, in the long run, nothing but wise government succeeds. If any design of Providence is revealed in history, it is clearly and unquestionably this, that good intentions of rulers shall not save the people; that they must know well, as well as mean well; that the ignorant statesman, whatever the condition of his conscience may be, shall be brought to naught; that, in short, politics must be cultivated as a science, and that its secrets can no more be got at by the cultivation of the heart than those of astronomy or chemistry. The example of President Lincoln will, doubtless, be at once cited in refutation of this theory; but President Lincoln, we reply, was a genius, and genius is an exception to all rules. It would be just as sensible to cite Oliver Cromwell, in proof of the uselessness of General Von Moltke's attainments, or Napoleon Bonaparte's victories in Italy in his first campaign, in proof of the worthlessness to a general of military experience. Moreover, Mr. Lincoln was concerned throughout his administration mainly with a moral question. His work was the simple one, as he himself defined it, of "pegging away," and he did it faithfully. In other words, he was called upon rather for tenacity and fidelity, and for thorough comprehension of the people behind him, than for legislative skill.

To illustrate the foregoing more thoroughly, however, we shall cite an incident in the career of a gentleman whom everybody respects, and none more than we do ourselves, and whose services in times past we rate as highly as anybody. He happens, however, to furnish an excellent example of the politician whose moral development has got the better of his intellectual one. His forte is his love of liberty, his keen sympathy with the poor and oppressed, and during the last thirty years these qualities served him in good stead. But the war brought him into power, and he was thereupon enabled to embody his own ideas in legislation. The gold speculators in 1863 were, as he thought, running up the price of gold, thus enhancing the price of commodities, shaking the credit of the Government, encouraging the enemy, protracting the war, and, in fact, working moral as well as political evil, and his indignation was greatly roused against them. Had the historians and economists gone to him, and told him that he could do nothing to stop the operations of the speculators; that if he attempted to meddle with them by penal legislation he would only aggravate the evil, and that nothing could effect a cure except the success of the military operations, inasmuch as the speculation was based on the uncertainties of the war, he would certainly have driven them from him with wrath as "dilettante," "kid-glove politicians," "philosophers," "theorists," men with "low moral feeling." So he brought in a bill sending the speculators to jail if they bought or sold gold except for foreign export. His position in the Republican party was such that the rest of the majority followed him like a flock of sheep, and the bill was passed at once. The working of the laws of political economy were at once revealed. Gold began to fly the country faster than ever, and the dealers in it stayed away from the market, or had to have higher prices in order to compensate them for the risk of selling. It went up in two days from about 200 to 280; it would have been 300 in a few hours more. Panic was spreading through the country; the price of every commodity shot up in sympathy with the price of gold; the poor began to be more pinched than ever, the credit of the Government was shaken, the prospects of the war made more uncertain than ever. The act was then repealed before the mischief went any further; but Mr. Stevens's ignorance, and that of his colleagues, here resulted in just as much evil as if the act had been framed from evil motives. We mention this case simply because it happened to furnish, within a brief space of time, and in figures, as on a thermometer, a perfect illustration of the way in which ignorant legislation works. Ordinarily, however, the effects of such legislation, instead of being registered in this way, and exhibited to the world inside forty-eight hours, are diffused over a wide area, and do not show themselves in a marked manner for a long period, or are so mixed up with other phenomena when they do show themselves, that it needs some mental training and close powers of observation to follow them up to their cause. But volumes might be filled with illustrations of the same sort.

The evil is a crying one, and the country is undoubtedly sensible of it. Large numbers of people feel that a government such as ours, dealing with a population such as ours has, cannot be carried on successfully without the infusion of some knowledge into legislation; that though it may be well to honor a man who "having begun life as a poor boy," and "never having had any schooling," has become popular and distinguished and rich, and hates evil, and to put him into a saloon car, it is not well to let him drive the engine; that political evil is not always perceptible to the mere moral vision; but for the majority the lesson is hard to learn. In trying to help to spread it, journalists have a very difficult duty. They have to make their impression instantly, and make it on men whose attention is difficult to catch, and whom they cannot hold down and force to listen as preachers can. Consequently they have in some way or other to be striking. Too often they accomplish this by ignoring all distinctions and by constant overstatement. Their opponents are always foolish and ignorant knaves, their friends are prophets, apostles, and martyrs; but everybody knows how little impression this sort of talk now makes on the public. For ourselves, we claim the use of the ordinary and legitimate rhetorical weapons, but falsehood, exaggeration, and vituperation are not amongst the number. We claim the right of pointing out as well as we can what we conceive to be political blunders, and the greater the reputation and influence of the man who commits them the more incumbent on the press do we hold it to be to assail the blunderers. Moreover, ridicule is a legitimate rhetorical weapon, and in periodical literature an indispensable one. In nine cases out of ten a *reductio ad absurdum* is the readiest and most convincing argument at hand, and it is an argument which it is impossible to use against some people without laughing while doing it. In dealing with really ignorant men, as one often has to do in dealing with politicians, who know so little of what they are talking about as to supply absolutely no basis for calm discussion, there is nothing to be done but laugh—and laugh heartily. Life is too short, and there is too much work to be done in the world to make it possible or advisable to sit down and reason on every subject that comes up with such lights as Mr. Robinson of Brooklyn or Mr. Rogers of New Jersey, or many others of greater fame whom we might mention but will not;

and, let us add, there are but few weapons which have rendered more service to freedom and justice and humanity, and all other good causes, than ridicule.

HONORARY DEGREES.

In a college calendar July may be called "the month of degrees." The present season has been as prolific as any of its predecessors in these academic distinctions. Not only has there been the staple harvest of bachelors, and a full assortment of masters, "in course" and "out of course," "honorary" and "*ad eundem*," but there has been, considering the cool weather, a very fair crop of honorary doctorates in law, medicine, and theology, with some show of fruit, as the gardeners would say, in the varieties which have been newly introduced into this country—the doctorates of philosophy and music. One institution which, so far as we know, is not distinguished for its advantages in the way of instruction, has bestowed, for several years, more honorary titles than it has numbered students in its graduating classes. For some time past we have watched these coronation ceremonies, when modest worth and ambitious intrigue are both rewarded with university distinctions, endeavoring to discover the law of selection by which some men come to doctorates and other men do not. Our curiosity has at least been repaid with amusement. Knowing some of the managers of our oldest and most honored institutions, we have been favored with glimpses behind the scenes, and have learned a little of the arts which are employed to secure the doctorates in divinity and law, these being "the grand prizes" in the commencement lottery. We have followed the steps of one candidate and another, and have sometimes seen the same person doubly dubbed with the mystic initials bestowed in two different colleges, by a surprisingly simultaneous recognition of his merit, when all the world was wondering that he was dubbed at all. The conclusion to which we have come is this, that the mode in which honorary degrees are conferred in this country is a sham and a shame. Institutions of learning which should be vigorous and independent enough to resist abuses, are led by the fashion, or by the demands of their graduates and friends, consciously or unconsciously, to perpetuate an evil which has gradually crept in, and which is fast becoming a positive nuisance.

To understand how these modern abuses have grown up, we must bear in mind the history of academic titles. Our fathers brought them to this country from England, where they formed a part of the paraphernalia of mediæval society. A college was an association or guild. None could enter it except by conforming to the prescribed formalities. Once admitted, various privileges were open to the scholar, and the diploma he received conferred in fact, as well as in form, *Jura*, *Insignia*, *Honores*, *Privilegia*, *Dignitates*. Many positions in life were accessible only to those who had passed through the academic portal. In this literary guild were grades or ranks. The bachelor had the right *prælegendi*, or of teaching with a text-book; the master had the right *profitendi*, or of being a professor, and of teaching without a manual his own accumulated wisdom. Gradually the doctor's rank became even higher than the master's, and was considered as the mark of superior distinction in some branch of learning. Like the lower degrees it was conferred upon examination, and was the certificate of the college or university which conferred it that the recipient was a proficient in medicine, divinity, or law. In accordance with the modesty which distinguished the foundation of our oldest American colleges, honorary doctorates were not, for many years, conferred at all. Even the honorary master's degree was sparingly bestowed. After a while, when the primitive simplicity of manner was yielding to the dignities and forms of the revolutionary period, doctorates of divinity and law were freely bestowed on men distinguished in church and state—never, we believe, in this country, for merit in examination, but always *honoris causâ*. As letters became a profession, the doctorate of law was conferred on men of scientific and literary attainments, without reference to their skill in jurisprudence. While the population was scanty and the colleges were but half-a-dozen in number, no great harm came from this bestowal of degrees. The colleges were chary of their honors, and the recipients were commonly men who were, at least, as worthy of academic distinction as any in the land. The college managers were responsible also to public sentiment. But now, the number of colleges has largely increased. No one pretends to keep the run of them. The doctorates which they confer are innumerable. Designing men are consequently enabled to make use of their academic titles to impose upon unwary people. They use their degrees to sell their literary wares, puff their schools, and secure consideration from their neighbors. The real distinctions of scholarship are popularly underrated, and many modest and eminent men of letters are depreciated because their more pushing neighbors have borne away the endorsement of the colleges. We hold, therefore, that the older colleges ought to recast their mode of conferring degrees. Let Harvard and Yale inaugurate a change, and the smaller colleges will soon follow suit.

There are several considerations which ought to be borne in mind in thinking of such a change. In the first place, all the colleges of the land, some hundred in number, claim the same privilege of creating doctors. A "female college" out West, or a chartered corporation without any students, can furnish the same brand as Harvard or Yale. "LL.D." looks just as well at the end of a name, and the "Reverend Dr." sounds just as well for a prefix, when the degree is conferred by the unheard-of University of Montana, as when it is received from Oxford or Cambridge. The public are very forgetful, and though the dons in our older colleges may scoff at the degrees of their younger sisters, there is no one else to care. Again, all these institutions, old and new, "male and female," bestow their honors, so far as we can discover, without any guiding principle. Certainly there is no avowal of reasons, nor any show of examination, nor any publicity of discussion. At the close of commencement exercises the gaping assembly is astounded by the announcement that A and B and C are constituted doctors of theology or law, and this grave distinction is telegraphed at once, through the associated press, to every city in the land; but no key is given to the proceeding. Who can tell why Professor Pierce was honored this year at Cambridge, or Secretary Stanton at New Haven?

But this indiscriminate bestowal of titles by well-known and unknown colleges is not the worst evil. It is so easy to get a degree, so many men of slight acquisitions have obtained degrees, that it is now the way to apply for these honors; and if the secret sessions of college corporations were made public, there would be an astounding revelation of intimations and open requests and indorsements. Members of the faculties of colleges are constantly applied to to lend their influence to secure a doctorate for this person or that. By designed coincidences, letters are sometimes received from distant points and from very different writers, calling attention to the peculiar merits of this or that candidate, and recommending him to favorable consideration.

What now is the remedy for this state of things? Three occur to us as possible. First, the older and firmer colleges might refuse to give honorary doctorates under any circumstances. The smaller and younger colleges would be likely to follow the example. This would be the simplest and easiest mode of remedying the abuse. Or, secondly, doctorates in law or theology might be given on examination—the candidate offering himself, like the candidates for the baccalaureate, openly and honorably, with a thesis or treatise which should exhibit his attainments. This is the usage of some of the foreign universities. Or, thirdly, a college might declare its purpose to advance its own graduates to honorary distinctions on certain recognized principles of promotion—the publication of some scholarly work, the accomplishment of some literary task, or the attainment of some high position. In every case the reasons for bestowing the degree should be openly avowed. If a man is made doctor of laws, the public have a right to know whether it means he has fought a battle, or is on the right side in politics, or is a donor to the extent of "five thousand dollars and upwards."

At present everything looks accidental. Two years ago, General Grant, on his way to Canada, happened to take a commencement dinner in a town down East, and came away LL.D. General Meade, on his return from a wedding, visited Cambridge, and bore away the same diploma. General Howard left the Freedmen's Bureau to visit his home, and the nearest college christened him doctor of laws. General Terry, on the other hand, came out a simple master of arts at New Haven, on the principle that a prophet is not without honor save in his own country. A few years before, a professor of Greek found himself proclaimed, at Cambridge, a doctor of divinity, when he had not even been ordained as a minister. Bismarck is announced as having just been made a doctor of philosophy in one of the German universities. George Peabody is doctor of civil law at Oxford. The newly arrived minister from Greece has turned up an LL.D. at New Haven. How many of the corporation could tell his name? So it goes year after year. Take the lists of any respectable college, and see whom they have honored and whom they have not. One hour's scrutiny would be sufficient to show that the whole system, as at present maintained, is full of fraud towards the public, unfairness towards men of letters, and dishonor to the name of learning and the thought of academic honor.

THE ENGLISH TRADES-UNIONS.

London, July 12, 1867.

In my last letter I told you that I hoped on some future occasion to give you an account of a matter which has been attracting our attention in England almost as much as the Reform Bill itself for the last six weeks or two months. This is the trades-union question, which, in one form or another, has been before the public ever since the beginning of the year. It has attracted a degree of attention which is not greater than it deserves; but which, I think, is almost greater than the interest which has attached to any other domestic matter which has occurred for the last twenty-five years. It is the first distinct case of a social problem raised and debated by the persons

who are principally and directly interested in it. The Poor-law was a social question; but it was discussed principally by the people who administered relief, and hardly at all by those to whom it was administered. Education may be regarded as a social question; but it is, in fact, treated partly as a political, partly as an ecclesiastical question, and nothing can be more remarkable, or, in my judgment, more lamentable than the fact that it is regarded by the classes principally affected by it with almost absolute indifference and apathy. The other great questions of our day have all been political. Trade-unions are a very different matter. You know, I fancy, from your own experience, what is their general nature, and what are their general effects; but it is probable that you may not be aware either of their history in this country, or of the space which they fill in the minds of our laboring population. It appears to me that there are no more vigorous organizations in the country, and that the part which they will play in its future history, be it what it may, will be one of the most important parts which has been or will be played by anybody whatever in our public affairs. However, this is anticipation, and as I do not pique myself on being a prophet, I will try to give you, instead of prophecy, a little bit of history, which may be more or less new to some of your readers.

To understand trades-unions you must go back to old times. Free-trade in England, in the sense of the repeal of protective duties, is a very modern institution, but we have had internal free-trade in labor, as far at least as it could be given by law, for the past forty-two years—that is to say, since 1825. Before that time the labor market of the country was hampered by a system of laws of which it is not easy in these days even to imagine the existence. They formed a most complicated system, the professed object of which was to regulate the rate of wages to be given for all sorts of labor, and to prevent, and indeed punish, any attempt to alter it by combination. For this purpose magistrates were authorized to fix the rate of wages in different trades for particular districts, and workmen were forbidden by a great variety of statutes, as well as by the common law, to combine together for the purpose of raising artificially the rate of wages allowed to them. The result of this was what might have been expected. The law was not strong enough to effects its purpose, and the workmen formed themselves into secret societies which set the law of the land at defiance, and enforced laws of their own as to rates of wages, hours of work, and other trade matters, by the most unsparing violence against both person and property. The prohibition of acts of parliament was encountered by other prohibitions sanctioned by arson, murder, and the throwing of vitriol. So strongly was this evil felt that it was at last resolved to repeal the whole system which occasioned it, and, accordingly, in 1825, the whole of the old combination laws were repealed, and permission was given by statute to men on the one hand, and to masters on the other, to combine together for the sake of deciding upon the rate of wages to be given or asked. At the same time provisions, which have since been proved by experience to be vague and ambiguous, were enacted, by which it was intended to prevent intimidation and molestation. A great deal of difficulty has been experienced, as you may readily understand, in deciding what kind of conduct amounts to intimidation or molestation.

Not to trouble you with the technical particulars of these disputes, I may follow the history of the trades-unions. They were rendered legal societies up to a certain point—that is to say, it ceased to be a crime to belong to them—but they continued to be regarded as unlawful in the sense of not being recognized by the courts as founded upon contracts capable of being legally enforced. In this kind of modified position they have remained ever since; but their growth, their popularity, and their influence have hardly been affected at all by the qualified excommunication with which the courts of law have visited them. They have extended over the whole face of trade in a marvellous manner, and there is hardly any branch of English industry to which they have not been applied to some extent and in some form or other. They have, as you must, of course, be aware, been occasions of memorable strikes, which, in some cases, have thrown thousands upon thousands of workmen out of work for many weeks or even months.

Till lately, however, it was the custom amongst educated people to treat their proceedings with the most sublime contempt. It was the all but universal practice—indeed, I do not remember a single exception to it—to treat the practice of striking as a proof of the gross stupidity and want of education of the laboring classes. It was always one of the best arguments for popular education that it would put an end to strikes, and it was assumed on all occasions to be a sort of eternal and self-evident truth that strikes were opposed to the first principles of political economy, and that they must of necessity fail. Be this how it might, there could be no doubt of one thing: the working classes did not and would not see the matter in this light. They went on striking with the greatest pertinacity, and at an expense which it was almost impossible to calculate. At last they began to obtain advocates amongst the higher classes; a reaction against the old politico-economical views of things set in, which was warmly supported by a certain number of more or less popular and influential writers, especially the disciples of Comte, to whose curious atheistical religion I referred in my last letter to you. These writers maintained both that the efforts which the workmen had in view were good, and that the means adopted to carry them out were effectual, and they further concluded that the old theories of political economists were founded on a very partial view of the material facts, and were thus both incomplete and false. This controversy has figured prominently in our recent periodical literature, and the workmen's view of the subject has been vigorously maintained, in particular in *The Fortnightly Review*, in articles written by Mr. Frederic Harrison and Professor Beesley.

Besides the general controversy on the theory and practice of strikes, a special local controversy has been going on as to the effects of strikes in particular places, and especially at Sheffield. It was alleged by the employers that the Sheffield workmen, not contented with mere combination, had had resort to intimidation of the most violent character, systematically carried out, and this charge having been made at the Social Science Association and elsewhere, and having been countenanced by several crimes obviously connected with trades-unions, a commission of enquiry for the investigation of the subject was demanded by the workmen themselves, and a commission was accordingly issued which had two branches—a central one, which was to enquire into the general question of trades-unions and their mode of operation, and a special one which was to investigate the particular town of Sheffield. The Sheffield commission had power to call all sorts of people before it, to enquire into all cases of outrages which had taken place within the last ten years, and to grant what practically amounted to a pardon to every one who would come before them and make a clean breast of any iniquities in which he might have been engaged. It will be difficult to give you anything like a fair account of the proceedings of the Central Commission. They took a great deal of very interesting evidence which was published in the papers as the enquiry went on—a variation from our usual practice here. Much of the evidence fell into the shape of a sort of duel between the witnesses and particular commissioners, especially Mr. Roebuck, who cross-examined them in the most vehement and uncompromising manner. Other witnesses delivered themselves of elaborate theories on the subject from the masters' point of view; but till the whole matter is before the public in a collated form, it would be impossible to give any opinion worth having as to the general effect of the enquiry. The Sheffield enquiry has been of a very different character, and has, indeed, been in some respects one of the most dramatic performances which have taken place on a judicial or quasi-judicial investigation in this country in recent times. Witness after witness was examined for a certain time without producing anything very startling, but at last the commissioners got hold of a man of the name of Hallam whom they suspected of having been mixed up in the murder of one Linley, who had been shot for disobeying trades-union rules. After a great deal of lying and a considerable quantity of bullying, Hallam at last fairly gave way, and owned that he had stood by when Linley was shot, urging a man of the name of Crooke to shoot him. He owned that he had been instigated to commit this crime by one Broadhead, who had been secretary to the Saw-Grinders Trade-Union. Broadhead on being examined owned that this was true, and after a great deal of cross-examination it came out that he had committed as many as twelve or thirteen crimes of the most outrageous kind, including murder, the blowing up of houses, and maiming or "laming" of noxious persons, to say nothing of almost numberless cases of what in Sheffield is called "rattening," that is, hiding the tools, and especially the engine shafts of persons who would not submit to trade-union laws. These disclosures have created an extraordinary sensation not only on account of their inherent atrocity, but because of the extraordinary coolness and brutal indifference with which most of the parties concerned confessed their share in them. The enquiry, they say, is to be extended to other towns.

I think that the state of feeling and state of society which are shown to exist by all this is in many ways very serious, though I cannot say that I much believe in the power of legislation to alter it. The root of the evil lies very deep indeed, and I do not think that we see anything like all its consequences, or indeed that the present generation is likely to see them.

The Reform Bill will have got through the House of Commons early next week, and by about the second week in August the House, I hope, will be well rid of it. What effects will it produce? Every one on this side of the Atlantic is asking the question in very various tones, but I find no one worth listening to who has much of an answer to give to it.

Correspondence.

THE RELIGIOUS PRESS.

To the Editor of The Nation:

I felt very grateful to you for the article in No. 107 about "The Nation and the Religious Press." It is a little mournful that such words should have to be said at all; that newspapers which ought, from their pretensions and position as representatives of Christian churches, to be the least open to the charge of unfairness should be felt by "educated, intelligent, and sincerely religious men" to be in their judgments and criticisms almost certainly biased by weak, petty views of things, by ignorance and by the odium of hard names.

It is a fact—Christian ministers ought to be the first to confess it—that questions of every character are treated of in the religious journals from a narrow, sectarian basis. In England and America, where sectarianism seems to have gone to extremes, extensively and intensively, the reason of this is plain. Each little community of believers holding, out of every score of doctrines, nineteen in common with the whole Catholic church, has its very life, even for a day, conditioned upon the emphasis of its one peculium. The Trinity, with its wealth of attendant truths, the Fatherhood and Incarnation of God, the Indwelling of the Holy Ghost, becomes of less importance in a theological examination than the renderings of *βαπτιζω* and *ἐπισκοπος*, the religious status of infants, or the question whether a table with no legs is an "altar." This habit—I have no hesitation in calling it the most fearful denial of the very essence of Christ's Gospel ever devised—has extended, as such things must do, into every relation of literature and life. It necessitates a universal narrowness of criticism. It is the Protestant Index Expurgatorius. A sentence is enough to condemn a book or an article, though it may have been written in the spirit wherein men pray. Doctrines which at first sight might seem witnesses for anything but exclusion and hard words, when used by men penetrated with this habit of small view become contradictory, even ridiculous. The Christian church has been edified these few months past by the spectacle of a religious newspaper abusing the name of "Union" and the words, too large and true for any sect's use, of the Nicene Creed, as it is called, into shallow tirade against Roman Catholics, High Churchmen in the Episcopal and German Reformed churches, and Baptists. Perhaps editors of church newspapers can explain the contradiction in all this; I doubt whether any others could do it.

Again, this narrowness of view necessitates ignorance, and so we find it. There are two kinds of ignorance—the dull stupid ignorance which does not know anything, which has no facts to reason from, and the duller and more stupid ignorance which, knowing the facts, does not know what they mean, what are their relations, how much larger and grander some are than others. Both of these faults—crimes they are really in men who teach men—are easily seen in religious newspapers. Bits of history which every scholar ought to know are either unknown or stated in a way which indicates that the writer has not the remotest idea what they mean. Somebody supposes that one of your editors is a "Comtian." How many editors of religious newspapers know what a "Comtian" is? How many of them would confess, if they knew it, that John Stuart Mill holds self-sacrifice to be the central principle of morality, ("Utilitarianism," pp. 24–5), or that Comte ever wrote such words as these?

"Car, le caractère propre de ce Nouveau Grand-Etre consistant à être nécessairement composé d'éléments separables, tout son existence repose sur l'amour mutuel que lie toujours ses diverses parties, sans qu'aucun calcul puisse jamais tenir lieu d'un tel instinct."—"*Système de Politique Positive*," Vol. I., 329.

But then it would be so much harder to talk against Positivism if these men did justice to Comte; it would be such a strange, unheard-of thing to judge him by the large rule of Christ's charity; it would sound as awkward to tell men that Comte confessed the Lord's Law of Sacrifice. At first sight it does look so: it is natural for us all to think that some gain can come to us, or our party or sect, by concealing or being wilfully ignorant of the words which prove that other men somehow think as we do on questions at least as deep as any which divide us. If I was not sure that God has been and is judging men for this habit of mind, which searches through books for their errors and not for their truths, I should suppose that religious newspapers would escape His condemnation. As things are, I cannot help thinking that their waning influence is but one of the signs of the wrath that is coming upon them.

But as the world grows in knowledge—real knowledge—there must be some substitute devised for the lack of it among religious newspaper editors—and so has grown up among us the odium of hard names. A name, by its very brevity, must express but a point among facts: whatever of suggestiveness attaches to it passes over upon all its relations and connections. What a perfect weapon for the criticism of small view have we here. How the lack of the inner and outward knowledge of a philosophy or of a book may be supplied by a convenient nomenclature. What a blessing are adjectives: how many hundreds of them can be attached to the name chosen, and it repeated thus hundreds of times—the adjective being the only novelty in each succeeding sentence. How easy to close and clinch the discussion with a Hamiltonian climax—about the heresy of denying the paramount authority of (this) consciousness? Have not "texts" been quoted? Denials or doubts about logic are here indeed perilous.

I confess that I do feel very strongly upon this whole subject. The really popular preachers of to-day are the religious newspapers; and it is fearful to think of the education they are giving to the men and women who read them. It is one of the strongest arguments for the inherent verity of Christianity—and I do not mean by that latitudinarianism or creedless churches, but the Christianity of the old confessions of the church—that it does survive at all amidst the confusions and denials introduced into it by men who utterly pervert and abuse it for the purposes of religion.

The most annoying unfairness of all is this calling of names, which you have yourself had a taste of. It is just intangible enough to be called cowardly as well as unfair.

While I so thoroughly sympathize with you in your protest against religious newspapers, I cannot help saying that scholars have been to blame, especially during the last century and this, for taking for granted, as so many of them have done—as more of them are doing to-day than ever before—that Christianity necessarily leads in literature and in criticism to narrowness, ignorance, and the odium of hard names. Scholars, no more than theologians themselves, have ever yet confessed theology—the science, the knowledge of God—to be the real centre of history, literature, criticism—all things. They cannot shift the blame by saying that the Church has not allowed them to take this position. The universal error has been yielding to scientific or theological temptations to forget it. When we are rid of these we shall be as one.

The New Englander certainly deserves all you have said of it, and more, in the way of praise. Its spirit is a beautiful contrast to that of its ephemeral weekly contemporaries. One has only to read the article on "Amusements" and the Book Notices, in the very number in which the offending words occur, to discover its catholic earnestness and courage. I think, however, it forgets that others beside Comtians, and among them earnest Christian theologians, have "questioned the validity of the argument from final causes."

J. I. F.

Brooklyn, July 23.

[In the controversy which has called forth this letter, we made no charge of ignorance against the editors of religious papers; we did charge them with forgetfulness of, or indifference to, the ignorance of large numbers of their readers.—Ed. Nation.]

MR. HENRY JAMES'S THEORY OF CREATION.

To the Editor of The Nation:

I have no demur to make to your appreciation of my article upon Swedenborg, in the last *North American Review*. I do not in the least know whether my "style" is a bad or a good style for metaphysic teaching, for I do not know, to begin with, what my style actually is. But this I do know, that no style of writing can be imagined perfect enough to convey truth—not scientific truth, of course, which enters merely into the memory, but spiritual or philosophic truth, which enters into the life—to an understanding not previously quickened to receive it. No human or angelic—much more no divine—skill suffices to make that seem true to a man's intelligence which his heart does not first pronounce *good*. The devil alone exercises this naughty art, and I doubt whether even he is not growing tired of it, its returns in these days of advancing freedom must be becoming so precarious.

But I do demur to your lending me the monstrous notion that creation is only a sort of "loving *finesse*" on God's part, whereby what really *is not* is made to appear as if it were. I should abominate any sentimental drivel of this sort as an offence to the creative sincerity. For I hold to creation, with no reservation, as a most literal and veridical achievement of the Divine power; only I maintained that the *locus in quo* of that achievement is *primarily* the spiritual world, which is the world of affection, and of thought, derived from such affection, and only *subordinately thereto* the natural world, which is the world of sensation, and of imagination derived

from such sensation. My suspicion is, indeed, that I hold to the actuality of creation much more thoroughly than most persons do. The ordinary traditional deliverance on that subject is, that you and I are unquestionably creatures of God, but only by virtue of our connection with the race. The race is supposed to have been created directly by God, and we indirectly, because we are included in it. The race is imagined to have been created a great while ago, and we, of course, were created in it, therefore, because we are a portion of it. Such is the average conception of Christendom on this topic, and it seems to me a very ghastly and repulsive one. For I conceive that you and I, and every other man, are directly or immediately created by God, and not indirectly or mediately through the race. On the contrary, the race is created through us its individual members, for it has absolutely no existence save as a generalization of our minds. Philosophy has always been victimized by this shallow fallacy of the sensuous or scientific understanding, which makes the particular to date from the universal, the specific from the generic, the fine from the gross, and not contrariwise. And there will be no revivification of it until it learns that in the true order of thought the whole derives from the part, what is common or identical from what is individual or distinct, what is natural, in short, from what is spiritual: and this invariably. Do I not then in effect unite Creator and creature in a much more living bond than is supplied by the received cosmology? I contend that God creates me not mediately through other men, but immediately by himself; that he, and he alone, gives me being at this moment, and always; thus, that a really infinite rectitude and beauty inform all my finite or phenomenal iniquity and ugliness, and will infallibly consume them ere long out of sight, or relegate them into the land of oblivion. And so long, accordingly, as I maintain this conviction, I enjoy an intellectual peace which mere religion has always been impotent to give, and which mere science will always be impotent to take away.

Now this substantially was what I said in my *Review* article. I there showed that God was bound by the law of creation to give us subjective or natural identity, in order to his giving us objective or spiritual individuality. Does this prove creation a "loving *finesse*" only on his part? You might as well say that the architect does not really build, but only "makes believe" to build, when he ordains a basement story for his edifice in order to give its upper stories light and air. And I showed this creative law so plainly, under so many forms of statement, that I can hardly believe my style alone in fault if my reader fails to understand me. Of course, the vast majority of persons are indifferent to this entire realm of speculation. And in many minds, not otherwise indifferent, what I have to say encounters, no doubt, a mountain of sturdy intellectual prejudice—of simply fossilized thought—which instantly falls upon it and buries it out of sight. If I could confine myself to repeating along with all the world, *In the beginning God created the heavens and the earth*, no man's speech, I venture to say, would seem more frank than mine. But when I append a harmless benignant *coda* to my special performance in that *concerto*, importing that "the heavens and the earth" therein mentioned are not primarily the physical phenomena so designated, but "the heavens" exclusively of the universal human heart, and "the earth" exclusively of the universal human mind, I instantly grow unintelligible. Why? Surely not because my "style" is inveterately opaque on all occasions, but rather because my reader has been so used intellectually to deem Nature everything and man comparatively nothing, that any reversal of that puerile superstition must needs strike him as ineffably dim and colorless in point of rational force.

I am, Mr. Editor,

Yours respectfully, HENRY JAMES.

CAMBRIDGE, MASS., July 20.

AMERICAN LAW REVIEW NO. 4.

LITTLE, BROWN & CO., Boston,

HAVE PUBLISHED

THE

AMERICAN LAW REVIEW.

VOL. I., No. 4.

CONTENTS:

I. The Limitation of the Liability of Shipowners by Statute. II. The Rights of Action of a Bankrupt. III. Modern Reform in Pleading. IV. Seals. V. Government Claims. VI. Digest of the English Law Reports for February, March, and April, 1867. VII. Selected Digest of State Reports. VIII. Book Notices. IX. List of New Law Books Published in England and America since April, 1867. X. Summary of Events.

Terms: $5 per annum in advance; single copies, $1 25.

Vol. I. (which this number completes) will be ready, bound in law sheep, July 10. Price $6.

This Review, the publication of which commenced Oct. 1, 1866, is designed to satisfy the want, long felt among lawyers, of *a first-rate law periodical*, well executed, and up to the wants of the profession, and worthily representing the literature of the law.

How far in this direction it has succeeded is best shown by its wide circulation, and the high rank and reputation already acquired. The following are a few of the very many laudatory notices it has received:

"We do not hesitate to recommend this magazine, and cannot doubt its success. . . . The Digest of English and American Reports is exceedingly well done, and is worth a year's subscription every month it appears."—*Boston Advertiser.*

"It is due to such a journal that the profession should patronize it liberally, and contribute to it generously."—*Boston Post.*

"The best periodical of the kind ever published in the United States."—*Boston Transcript.*

"This magazine is conducted with signal ability, and must be of great value to the legal profession."—*N. Y. Commercial Advertiser.*

"This new periodical is edited with ability, and bids fair to gain a high position in the specialty to which it is devoted."—*N. Y. Tribune.*

"The character of the review is well maintained. Its criticisms of men and books are fearless without being harsh. The original matter is well written, and the digests of cases carefully prepared."—*N. Y. Nation.*

LIBRARY AGENCY.

G. P. PUTNAM & SON, 661 BROADWAY, N. Y.,

Are Commission Agents to purchase books by the thousand or single—English or American—for public libraries or individuals, on the most favorable terms, according to the quantity ordered.

NEW PUBLICATIONS.

THE SEVEN WEEKS' WAR.

Its Antecedents and its Incidents. By H. M. HOZIER, F.C.S., F.G.S., Military Correspondent of the London *Times* with the Prussian Army during the German Campaign of 1866. Two vols. 8vo. With numerous Maps and Plans. Superfine paper, extra cloth. Price $10.

"All that Mr. Hozier saw of the great events of the war—and he saw a large share of them—he describes in clear and vivid language."—*London Saturday Review.*

A HISTORY OF SACERDOTAL CELIBACY.

An Historical Sketch of Sacerdotal Celibacy in the Christian Church. By HENRY C. LEA. In one octavo volume of nearly 600 pages. Extra cloth. Price $3 75.

"We do not exaggerate the merits of Mr. Lea's book when we say that it is evidently founded on a remarkably wide and profound examination of the original sources of information, its arrangement is lucid, and the spirit that pervades it is in the main just and philosophical."—*The Nation.*

METEORIC ASTRONOMY.

A Treatise on Shooting-Stars, Fire-Balls, and Ærolites. By DANIEL KIRKWOOD, LL.D., Professor of Mathematics in Washington and Jefferson College. Printed on tinted paper. One vol. 12mo, extra cloth. Price $1 50.

EUGENE ARAM.

A Tale. By Sir EDWARD BULWER LYTTON, Bart. The Globe Edition. With Frontispiece. Complete in one vol. 16mo. Fine green cloth. Price $1 50.

MELPOMENE DIVINA;

Or, Poems on Christian Themes. By CHRISTOPHER LAOMEDON PINDAR. One vol. 16mo., extra cloth. Price $1 50.

The Week.

MR. STANTON's resignation has been curtly asked for by the President, and as curtly refused, so that we shall probably have a grand case of "holding over" to furnish entertainment during the next two or three months. General Grant is talked of as a temporary successor. If there be any meaning in the Tenure of Office act, Mr. Stanton need not stir; but it seems as if Mr. Johnson, having got the fear of impeachment out of his mind, was bent on giving the Radicals "a taste of his quality," and doing as much mischief among them as possible prior to his disappearance from the scene. He talks, it is said, of going back to Tennessee to be a candidate once more for the Senate, and, in case of his success, we venture to predict that he will make his appearance in his old place as little changed since 1859 as accomplished facts will permit.

The rumors that the President intends to remove General Sheridan have grown in strength during the last fortnight, and, as we write, are believed by everybody. For a short time after they first got afloat, the President's organs, in the press, denied them with much horror and indignation, but this was while Congress was sitting. As soon as that body had adjourned until the last week in November, the measure began to seem not only probable, but natural, and it has within the last few days grown into a highly proper and even praiseworthy proceeding. It is on its face so foolish, and Mr. Johnson's mind is so tortuous, that an enquiry into his motives is not likely to be of much use, even if undertaken with greater knowledge of his character than we pretend to possess. One cannot be very far astray, however, in guessing that Sheridan will be removed, either out of pure spite—the spite of an obstinate man who has been long writhing under a sense of his own helplessness—or as a sort of stupid assertion of the constitutional power of the President, which, as Mr. Johnson conceives, Congress has been encroaching upon, and he is bound to defend. Abundant support for either of these theories can be found in Mr. Johnson's official history, and we offer the reader his choice of them, such as they are. General Sheridan's removal would be unfortunate for the country, inasmuch as it would encourage that spirit of resistance at the South which is now the great obstacle to reconstruction, and the great cause of Northern exasperation; but if either Hancock or Thomas were put in his place, the state of things at the South as affected by the action of the Government, would probably undergo little if any change. For General Sheridan himself his deposition would be a great gain, and would probably make all things possible for him. How much it might do for him is suggested strongly by the expressions of opinion which, as we we predicted last week, General Grant's premature nomination already begins to call out. It has, we make bold to estimate, roused two enemies into activity for one friend, and one begins already to hear of "sections of country" which cannot bear the mention of his name. The Republican busybodies have only to keep nominating him, and they will soon make the Convention afraid to touch him.

A week has been occupied, in the Surratt trial, in listening to the arguments of counsel. Mr. Merrick led off for the defence, mingling some lawyer-like talk with charges against the prosecution of being inspired not only by Government but by certain of its blood-thirsty officers in combination, and of falsifying the issue by a mass of irrelevant testimony proving the prisoner's complicity with the rebellion. Mr. Bradley also wished the office of the murdered President to be put out of sight in order to exclude what we may call the political testimony; and, after denouncing the treatment which the prisoner had received, the abuse heaped upon him and on "a mangled man," meaning Booth, and the general vindictiveness of the prosecution, called Weichmann a "reptile," next, a "wretch whose tongue ought to be blasted," "an arch-traitor," and finally a "dog"; Miss Annie Surratt was a "poor stricken girl," and the accused a "poor boy." Judge Pierrepont proved to the jury from "all history" that no assassin of a great ruler had ever yet escaped detection and punishment, and then proceeded in a very clear manner to recapitulate the evidence for the prosecution, and to sum up the case for the Government. The jury have not yet rendered their verdict, and, perhaps, will have none to render. There seems, however, to be no doubt that Surratt knew the full extent of the plot which ended in Mr. Lincoln's death; that he was in Washington the day of the assassination, and that he deserted his mother in her peril, seeking refuge first in Canada and afterwards abroad. Whether her life ought to have been spared, and whether the President refused to exercise in her case the clemency recommended, or said to have been recommended, by a majority of the Military Commission, are open questions. That the son is as guilty as the mother was, admits of no question, and it is possible that her fate may determine his, for decency's sake.

The Kentucky election took place on Monday. The ridiculously small loyal or Radical vote shows what insignificant progress has been made in the State during the past two years by republican ideas. At each election there have been predictions that Kentucky would "redeem" herself, but instead of growing stronger and stronger, the Union party apparently is losing the little strength that it had. The twenty-five members elected to the Legislature must be divided between the Unionists and the National (as opposed to the Confederate) Democrats. Kentucky has been able thus far to prevent negro suffrage, and has submitted very stiffly to freedmen's schools. She continues to occupy that isolated position which made her dangerous during the war, but leaves her now only a nuisance. Time, with its emigrations and immigrations, the dying-off of one generation and the springing up of another, its comparisons and examples and warnings—time, or Mr. Sumner's bill for national impartial suffrage, will work the needed revolution in the last of the slave States.

We have reviewed elsewhere the political events and movements of the Southern States, in which, as we have remarked, more disorder has arisen from white misguidance than from any unreasonableness on the part of the blacks. The latter have, we may add, exhibited traits which prove the sagacity with which the Republicans invited them as auxiliaries. Some who accompanied Senator Wilson on his Southern tour thought him unduly sanguine of the adherence which the freedmen would give to the Republican lead. The Tennessee election justified his calculations remarkably, and from it the freedmen appear the most tractable and devoted followers that a party could desire. More than that, wherever encouraged they have furnished organizers of their own whose services have been of the utmost importance, as will be seen especially in South Carolina and Georgia at the first opportunity. In fact, we look to the blacks for the best type of politicians—those who are born such—fluent of speech, all things to all men, sympathetic, magnetic, adroit, in short, all that the French understand by *habile*. These qualities, we are well aware, will not always be divorced from unscrupulousness, ambition, and a mercenary spirit. They will, however, spring as naturally to the stump as they have ever done in the case of the whites. The first efforts of the blacks in political oratory will be watched with curiosity, and we are certain will not disappoint. The camp-meeting style is already well adapted to party gatherings, but when infused with the unrestrained humor of the plantation it promises to be almost irresistible.

The Fenian public will be pleased to learn that by the last accounts "President" Roberts of the Brotherhood was in Southern Italy, conferring with "the party of action" in that country. The "party of action," however, have at present designs on the pope, and on no other potentate, and unless Mr. Roberts joins them in an attack on the Holy See, there is little likelihood of his getting any aid from them against the Saxons. If the Fenians were to end by turning their invincible arms against the "patrimony of St. Peter," it would certainly be a fitting and amusing termination to the career of the organization. This news about Mr. Roberts comes by the Cable, and is, therefore, somewhat doubtful. We distrust it all the more because, unless we are greatly mistaken in the man, he is not likely to be found in a hot climate at this season. If we were asked to guess at his whereabouts, we should place him in Switzerland. This, by the way, is the month which he fixed, before his departure, for the invasion of Canada, so we may any day now hear of horrid slaughter on the border.

A committee of the nominating convention which sent Mr. Banks to Congress has exonerated him from the charge of drunkenness at Portland, last summer, but Mr. George W. Copeland, the accuser, announces in the Malden *Messenger* that his proofs are still ready, and that he believes the committee have based their report merely on correspondence, and dares them to publish it and the evidence with it.

Mr. George Walker has rendered foreign investers in American securities good service by sending to the London *Economist* an elaborate and conclusive refutation of the alarming stories which have been for some time current here, as well as abroad, touching the amount of the aggregate debt of the United States, Federal, State, and municipal. He shows that the State debt only increased $96,354,521 during the six years ending with 1866, and that, in the States of Ohio, Indiana, and Illinois, the aggregate debt was actually, during that period, reduced by $6,000,000, while in Pennsylvania it was reduced $2,000,000. He shows, moreover, that while hardly none of the States of the West, and few of the States of the East, approached New York in the extent of their outlay in bounties, yet, if the debts of the rest of the North, both State and local, were on the same scale as that of New York, they would not exceed $850,000,000, while it is certain they are nothing like so large. His conclusion is that the entire debt, State and local, of the whole Union, including the Southern States, cannot exceed $650,000,000, which, added to the Federal debt, as it appears by the June statement, would make the total public debt of the American people $3,165,000,000—a sum which it was at one time confidently anticipated the Federal debt alone would reach by the close of the war. The stories afloat in Europe on this matter have represented the total debt as at least $4,000,000,000, and nearer $5,000,000,000, and local debts as amounting at least to $1,500,000,000.

We furnished our readers some weeks ago with a remarkable specimen of masculine argument from a feminine pen. We have lighted during the past week on the best specimens we ever remember to have met with of what is commonly known as "a woman's argument," in the speeches of two men, both of the speeches, comically enough, being delivered in opposition to female suffrage, and in reply to Mr. Geo. W. Curtis, in the New York Constitutional Convention. We believe the two gentlemen who delivered them are excellent persons, but we challenge anybody to forward us from his repertory of feminine absurdities stronger indications than they have furnished in these speeches of the absence or weakness of the reasoning faculty, and yet they are not simply legislators, but constitution-makers—that is, framers of organic law for the government of one of the richest and most highly civilized communities in the world. In proof of the assertion that women did not desire the electoral franchise, which Mr. Gould adduced as an argument for their exclusion, he said he *knew* they did not desire it *because* "his wife and daughter, whom he knew best, were totally opposed to female voting." He also cited as part of the same chain of proof the fact that "the very last lady who had taken tea at his house had pressed his hand in taking leave of him," and besought him "not to impose the elective franchise on women." He then, by way of proving that the views of women on this subject were sound, showed that the civil (Roman) law, with its partnership theory of marriage, was "heathen," while the common law, with its doctrine of coverture, was "Christian," but made no mention of the laws of Menu, in which the doctrine of coverture is pushed to its last limits. The result of the adoption of the civil law, he said, was a state of society like that of Paris—"and you know," said he, "how children grow up there degraded and miserable"—Paris being the city of all cities in which the education of children is most careful and elaborate. Does anybody remember anything worse than this in the speeches, public or domestic, of any foolish woman? If so, we shall be happy to publish it, if properly authenticated. Mr. Gould was followed by Mr. Larremore, who, we think, on the whole, beats him in the femineity of his logic, for he cited as an argument against the "Women's Property Laws" of 1848 a case which he himself declared "exceptional," in which a wife, to whom a husband had conveyed his property as a precautionary measure, refused to reconvey when he retired from business, cut down his pocket-money, took away his cigars, and made him smoke a pipe. To Mr. Curtis's argument, drawn from the example of the presence of a woman on the English throne, Mr. Larremore replied "that it was true that England might boast her solitary queen, but America reckons them by millions." We remember only one piece of female reasoning equal to this, and that was an objection made by a young lady to Dr. Dix's delivering lectures on Pantheism in Trinity Church, based on the fact "that the congregation were not *panthers*." We say deliberately that we think an able and all but unanswerable argument, from the anti-female-suffrage point of view, in favor of the disfranchisement of the members of the Constitutional Convention, on the grounds of inability to reason and want of capacity to comprehend political questions, might readily be based on the performances of Messrs. Gould and Larremore on this occasion.

Postmaster Kelly, of this city, has sailed for Europe in order to examine the great post-offices of England and the Continent, so as to collect information for the guidance of the Commissioners in deciding on the plans lately exhibited in this city. This is a very amusing and characteristic incident. Mr. Kelly, or somebody else—we should have been in favor of somebody else—ought to have gone before the plans were advertised for at all, and the results of his enquiries ought to have been used by the Commissioners in drawing up specifications of what they wanted for the guidance of the competitors.

The shooting still continues in Mexico, and pains seem to be taken to make the butcheries as cruel as possible. Permission was, for instance, refused to General Vidaurre to see his son in his last moments, and he was shot within two or three hours of his capture. The New York *Tribune* foreshadows the appearance on the scene of two political parties—one the Know-Nothing, led by Escobedo, and the other the Constitutional, led by Juarez. The chances are that Juarez will be victorious at the election, and there is no question that his platform is beautiful; but then it is pretty certain, also, that if Escobedo is defeated he will not submit, and we shall then have rehearsals *ad infinitum* of the events of the last twenty years.

The Mexican authorities, it is said, still strenuously refuse to give up Maximilian's body, which gives one rather a worse opinion of them than if, as was at first reported, they had tried to sell it; for in that case they would, at least, have displayed a prudent regard for the national finances, which are in great disorder, and it is not often that the treasury has a prince's body to dispose of. We are still in hopes, however, that they are really holding out for a rise in price, though they pretend to be simply indulging in obstinacy, or what Western people call "cussedness." Of the two we prefer, in such a case, the greed to bad temper, though there is not much to choose between them.

The Emperor Napoleon is still in trouble. There are constant rumors that copies of Maximilian's correspondence with him are in the hands of an Austrian gentleman with the portentous name of Bombelles, who threatens or is reported to threaten to publish them, and, of course, in the meantime he is at liberty to spread what reports he pleases about the contents, and either he or his friends are apparently making the most of the opportunity. The more Maximilian's death is thought about and talked about, the worse look does the Mexican expedition wear in the eyes of the French public. And then the Opposition has thriven terribly on the food furnished by it and by the German war, so much so that M. Rouher, in spite of his extraordinary ability as a debater, has been crushed in all the recent encounters, and has been forced to see himself held up to scorn in M. de Girardin's paper, *La Liberté*, as a person whose word cannot be believed. M. Rouher is unscrupulous in the extreme in his statements, and uses freely any assertions which at the moment may serve his purpose—a weakness which occasionally leads to horrible catastrophes, as when he announced last spring that Germany was cut into three divisions, being therefore feebler than ever, and was within two days crushed by the publication in Berlin of the treaties between Prussia and the South German States. The eagerness he has shown in these conflicts has gradually diffused through Paris a faint odor of ministerial responsibility to the Chambers, at which the Emperor has taken alarm, and has sent M. Rouher the Grand Cross in diamonds, hoping this will compensate him for his "recent annoyances," and assuring him of his "continued approval," thus reasserting in the most marked way the doctrine on which the whole Napoleonic system is based, that ministers are responsible to the Crown alone.

The history of the last four weeks in Paris ought to be sufficient to cure any discontented republican of his longings for the peaceful shades of Cæsarism. M. Sainte-Beuve, the foremost writer in France, is insulted in the Senate and challenged by a bully, who, in 1848, was a "red" and socialist, for having in his place defended the freedom of the press. A pupil of the Ecole Normale writes a letter approving of M. Sainte-Beuve's speech, the letter is accidentally published and the Minister of Public Instruction shuts the school up, ruining all the students. The press remonstrates, and the minister's two sons—both public functionaries—challenge and assault an editor, in his own office, and the editor can get no redress from the courts, because the minister can overawe the courts. On the contrary, the editor is himself prosecuted. Another senator's sons challenged another editor because he did not write their father's name properly, and, on his refusing to fight, assault him also, and make a practice of meeting him in the street and spitting in his face—the police not interfering. This editor has no redress also, and for the same reason; but, as in the other case, is himself prosecuted before the police court by the men who have outraged him, and with all but the certainty that he will be condemned. All this, in "a nation of gallant men and of cavaliers," is pretty bad, and shows what the value of constitutional guarantees is when that greatest of all guarantees, the responsibility of public functionaries before the ordinary tribunals in the ordinary way, is wanting.

The English Reform bill has passed the House of Lords, where it threatened to stick. The history of the bill is perhaps one of the most extraordinary bits of political history in existence. It exhibits the introduction of a radical change in the constitution of the most conservative and most aristocratic country in the civilized world, under the leadership of a Jewish adventurer with whom no portion of the population has a particle of sympathy, and by the use of tactics which all parties agree in pronouncing base and which all acknowledge to be absolutely without precedent, and which involve the total repudiation of party government. Lord Cranborne, one of the ablest of the Tories, pointed out in the closing debate, in a speech of extraordinary power, that Mr. Disraeli's performances, if adopted as a precedent, would convert parliamentary government into a mere scramble of individuals for office, instead of being what it is now, the contest of opinions for ascendancy. If, when a man gets hold of power, he may, as Mr. Disraeli has done, instead of laboring to embody in legislation the theories of government he has held in opposition, merely turn round and ask the majority what they want to have done, and then do it blindly without seeking to impress on their policy any traces of his own will, there is, of course, an end to statesmanship, and a game of manœuvring for office takes its place.

The last English papers are filled with accounts of the Sultan's reception and that of the Belgian volunteers—two incidents which so completely absorbed public attention that even the Reform bill and the trades-unions were lost sight of. The Sultan seems to have fared reasonably well; he had Buckingham Palace to himself, lunched with the Queen at Windsor—but she got rid of him in half an hour—and he was entertained at a tremendous ball at the India House, the expenses, by-the-bye, to the great scandal of the best Englishmen, being paid out of the Indian revenues, the appropriation being justified by the allegation that a very large proportion of the Queen's Indian subjects being Mussulmans, there is no harm in making them contribute a few thousands toward the entertainment of the Chief of Islam. There was, doubtless, much in the Sultan's visit to bore him awfully, but that he is not a man to submit to more boring than he can bear may be guessed from the fact that he stopped the train which was bringing him up from Folkestone to London, had the Prince of Wales and the Duke of Cambridge, who were in the same car with him, get out and leave him, and then took a pleasant nap in the car on the track. This furnishes *The Spectator* with a text for a disquisition on the difference between "European will" and "Oriental volition," its conclusion being that the European will is an agent, like steam or electricity, which the owner only calls into operation occasionally, and which it costs him considerable effort to put into operation at all, while the "Oriental volition" is a kind of self-acting apparatus, which works almost without any trouble to the owner, putting a man to death or stopping a train to take a nap as readily as it raises the eyelids or closes the hand.

The Belgian volunteers, 2,500 strong, were entertained at dinner by the Queen, or rather at Windsor Castle in the Queen's absence; and afterwards by Miss Burdett Coutts, at her country house near London, this being probably the largest dinner-party ever given by an unmarried lady, and therefore we suppose a sign of the times. She has, however, done a better thing, in erecting a large market for the poor in one of the most crowded districts in London, thus supplying what they have never had before—a clean and well-ventilated place to choose and buy their food in.

Notes.

LITERARY.

MESSRS. HARPER & BROTHERS announce "Called to Account," by Annie Thomas; "Manual of Physical Exercises," by William Wood; the abridged edition of Miss Strickland's "Queens of England;" and "The Early Years of the Prince Consort."——Messrs. Hurd & Houghton announce "An Introduction to the Constitutional Law of the United States," by Professor John Norton Pomeroy, LL.D., of the University of New York, and author of "An Introduction to Municipal Law," a clear and well-condensed treatise.——Messrs. G. P. Putnam & Son: "Human Life, considered in its Limitations," by Dr. Sweezer.——Messrs. Leypoldt & Holt: Thomas Hare "On Representation," edited, annotated, and amended by Simon Stern.

—The latest contribution to the sociology of the North is the "Report of the Provost-Marshal-General for 1866." Under the several drafts, we learn from it, 605,045 men were exempted, and of these 155,730 for physical or mental disability. The timid and unpatriotic who then displayed their defects with alacrity in the hope and often with the reward of rejection, may here see what character they have helped affix to their respective States. According to the disabling causes, therefore, this is Rhode Island's rank on the record: Imbecility, 1; intemperance, 1; excessive obesity, 1; unchasteness (we omit the particulars, which are properly given in *The New York Medical Journal*), 1; and (is it a cause or a consequence?) small-chestedness, 1. For a diminutive State this is a tolerably concentrated bill, and if any wanderer, native or immigrant, were to select a settlement for himself and his posterity, he would perhaps be justified in avoiding Rhode Island. But his chest will not grow, though his headache will, if he retreats into Massachusetts; and in Connecticut he will be liable to epilepsy, and in New Hampshire to insanity, paralysis, and neuralgia, perhaps accompanied by a protuberant abdomen that in Maine is hardly less protuberant; and in Maryland he will be deaf, and in West Virginia dumb, and in Minnesota—that paradise of invalids—cancerous; and will lose tone by going to Iowa, and by going to Missouri—but the list is endless. Only in Kansas he may feel safe from imbecility.

—Mr. Charles Lanman has furnished the public with a lively account of the history of his "Dictionary of Congress" from its inception in the winter of 1858 to the present time. If the half of what he says be true, the vanity, the insincerity, and the ingratitude of Congressmen are really appalling. Mr. Lanman recounts the miserable end of several who refused to give him any information about themselves, and as for those who voted against his dictionary on the score of economy, he shows how they "engaged in the butter trade directly in the shadow of the Capitol," and got sinecure offices, and otherwise evinced an interest in the public funds not wholly to the advantage of the public. All this, even without names or initials, is piquant reading. The parties accused will recognize their own portraits, and when their turn comes will doubtless retaliate. Politics, as Mr. Lanman proves, have entered into the controversy about his book, but he does not seem to have considered how much he is himself to blame for this; for it would appear possible so to edit the biographies as to preserve at once the essential facts in the political career of each subject and the due proportion between men of different prominence and importance, in a manner almost to defy criticism. There should be, too, an interval of four years between each edition, or some term which should lessen the difficulty of treating of living politicians and office-holders. And, finally, every pains should be taken to make the names of persons and places, and all dates, strictly accurate. Mr. Lanman has pointed out the obstacles to this consummation, but he does not satisfy us that the best has been done that might be done—say, by walking two miles instead of one for a fact, and paying ten dollars cash instead of five for two lines of information.

—*The Spectator* reminds the Quarterly Reviews that they are pursuing a course likely to hasten their decay when they subtract themselves more and more from the living issues of the day. *Blackwood* and *Fraser* give less and less space to politics, other Reviews not a line. None do for politics what neither the journalists nor the writers in the monthlies can do—treat them exhaustively, and at the same time judicially, inviting to this task "politicians of great experience and high standing," who will not write for the other periodicals, nor anonymously for the press. In the quarterlies they would have room to expand themselves, and to go into details with all the freedom of the platform. The indifference manifested by *The Edinburgh*, in its last issue, in regard to the reform question in England and the political revolution in Germany, is pointed out by *The Spectator*, which gives "this extraordinary list" of articles:

"I. The Early Administrations of George III.; II. Agriculture and Prices in England (1259-1400); III. Ferrier's Philosophical Remains; IV. The Council of Constantinople; V. Indian Costumes and Textile Fabrics; VI. Life and Speeches of Lord Plunket; VII. Wine and the Wine Trade; VIII. Josiah Wedgwood; IX. Burton's History of Scotland; X. Military Institutions of France."

While the quarterlies are yet quoted and consulted, Mr. William F. Poole, the librarian of the Boston *Athenæum*, means to continue the service he has heretofore rendered to students and writers by his "Index to Periodical Literature," by publishing a new edition in which the references will be brought down to the present time.

—Rev. W. L. Gage kindly informs us, *à propos* of our recent notice of Freytag and his works, that Freytag's "Lost Manuscript" ("Verlorene Handschrift") has already been translated and published in England by Chapman & Hall, and Mr. Gage has the impression that this translation has also been reprinted in this country. The "Bilder aus der deutschen Vergangenheit" has also appeared in England.

—On Wednesday of last week Miss Catharine Maria Sedgwick died near Boston, in the seventy-ninth year of her age. Although her last work, a life of Joseph Curtis, of New York, was published in 1858, she belongs, as an author, to the generation before the present, and is remembered chiefly and most distinctly by those who have ceased to be young. It is even now not rare to meet on shelves, other than those of Sunday-school libraries, the "Poor Rich Man and Rich Poor Man," and "Live and Let Live;" but her other writings from 1822 to 1845 are not common nor so well known, though popular in their time. One of her novels was translated into several foreign languages. Miss Sedgwick's influence on our literature and through that on society, was creditable to the one and highly useful to the other. Her native goodness, fine moral sense, and warmth of heart, elevated while they charmed her readers, and the good sense which distinguishes the name she bore she shared along with the rest of that gifted family.

—Mrs. Ripley, of Concord, Massachusetts, whose death is also recent, was a scholar rather than author, and though highly esteemed by a remarkable circle of friends, and, perhaps, the cause of much good writing in others, was hardly a public character.

—Professor Anthon, whose death occurred July 30, was one of the oldest and perhaps the most widely known of American scholars. In this city, and, indeed, wherever the influence of the New England colleges was not strongly felt, he did far more than any other man to fix the type of the scholarship of the generation which is now upon the stage. This he did partly as professor in the leading college of this State, partly as editor of innumerable school and college text-books. In his direct and legitimate work as a college instructor he ranks very high. His ready and extensive information, enthusiasm, and tact and knowledge of men—qualities most serviceable to a teacher—gave him an unusual degree of success in dealing with his classes. His students became warmly attached to him, and we are inclined to think carried away with them a heartier love of the classics, and a readier familiarity with them, than are acquired from many professors vastly superior to him in genuine scholarship. The character of his literary work can be better appreciated by glancing at the part which he took in the general progress of philosophy in this country. Classical instruction forty years ago was in the same condition of neglect in which education in general had then fallen. Professor Anthon deserves the credit of having been one of the first to see this, and to make a serious effort to remedy it. A series of text-books better than any then in use seemed to him the best means for this, and he zealously applied himself to prepare one. In this opinion he was probably right. The very best instrument for elevating the preparatory schools is, no doubt, the reaction upon them of a high standard maintained in the university for which they prepare, as is seen in the influence of Harvard, Yale, and Michigan upon the schools of their respective States. But in New York there was no one institution that could exercise such an influence, and the next best instrument was that which Dr. Anthon chose. That his success in this was more than questionable—that he made poor books, and an immense number of them—is admitted by all competent judges; how much of the failure was due to unavoidable causes it is hard now to say. It is clear enough that the work he undertook was too great for one man to accomplish single-handed. One man cannot do everything; but this man tried to do everything. The right way to get a good series of classics is to divide the work among many persons, so that each may be able to do his best, as is done in the various German series. Perhaps at the time that Dr. Anthon began his labors he could not find competent coad-

jutors. It is certain that he edited far too many books for his reputation. Apart from the impossibility of the task he had proposed to himself, there is a serious fault running through all his books, depriving them of the confidence of good instructors. He himself defends his method of very copious notes and translations on the ground that he had no other course, in view of the incompetency of most instructors. The scholars must have help. Very true. But what he gives them is not help. The majority of boys, if they have a passage translated before their eyes, will not trouble themselves to do anything more than commit this translation to memory—a practice which the incompetent instructors complained of will do nothing to prevent. It is very seldom a passage needs to be translated out-and-out; in nine cases out of ten it is enough simply to explain the construction, referring it to its grammatical principles, and thus force the scholar to work it out himself. The true way is to tell him where to look, and then leave him to find for himself. If he is lifted over every difficulty without any exertion of his own, he can only make a superficial scholar. He is not helped but injured. It is not fair to ascribe the success of Dr. Anthon's books wholly to this prevailing fault. No doubt many of them were really superior to any of their rivals, but no doubt, too, their chief recommendation was the comfort they gave to dull and lazy students, and, we will add, lazy and incompetent teachers. For one of the things which most teachers need to learn is, that in education *things, results*, are good for nothing in themselves, but only as we acquire them by our own effort. The results of German scholarship are of little service to us unless combined with German methods by which we can search them for ourselves. One of the most common and plausible arguments against making boys study Latin and Greek is that we can get all the results in translations and other modern works. But in these we do not get the results; we get only the shadows of results. We can get real results only at first hand by working them out for ourselves; and students are not helped in doing this by the kind of aid that Dr. Anthon gives them. Apart from this fundamental defect, Dr. Anthon's notes have much merit, as giving about the amount of collateral information which boys need. His books are not works of first-rate erudition. He did not belong to the school of exact scholarship now coming upon the stage, but to the school of elegant general culture in classical learning, which has now nearly passed away. But even in his own school he did not rank high as an editor, but must be put in the class of mere book-makers, which has so abounded in late years. We gladly recognize his fine qualities and real usefulness, but must condemn freely the faulty system on which his books are made; for it is by his books that he is known to the public, not by his powers as a teacher, and his books will be rapidly swept into oblivion with the progress of genuine scholarship.

—Our readers may remember a former allusion to the hardship inflicted by the French Government on the Duc d'Aumale, who had laboriously prepared an "Histoire des Princes de Condé pendant les seizième et dix-septième siècles," which was all printed and in the hands of the binder when it was seized by the authorities. In vain were the courts appealed to for redress; the loss was absolute to the author and publisher. This case was cited a few weeks since by the Opposition in the Corps Législatif, and the Duc de Persigny, the then minister of the interior, being charged with the outrage, replied, in a letter published in the *Moniteur*, that, instead of confiscating private property, he had caused the prefect of police to intimate to the publisher, Michel Lévy, that the seized books would be forwarded to any foreign depot he might select. M. Lévy rejoins that, in the first place, if such an intimation was received and consent given to the proposed arrangement, no official confirmation was ever transmitted to him by prefect or minister, but that even the performance of the agreement would have been no indemnification for the loss sustained. Having no branch establishment abroad, the publisher would have been compelled to dispose of a French book in an alien market, and it was not with such a task in view that he contracted with the author, and paid eighteen or twenty thousand francs for a book which never got upon the counter. What aggravates the seizure is that the obnoxious work contained not the shadow of an attack on the present political institutions of France, nor even the slightest allusion to them, while the fact that it was written by the heir of the house of Condé made it a precious addition to the store of history. But none of the Orleans princes may look for justice to the successor of their father.

—M. Emile Jacquemin has attempted to explain the history of creation on the basis of universal polarity ("La Polarité Universelle, Science de la Création. L'Homme, son Organisation Spirituelle." Paris, 1867. L. W. Schmidt, New York). Everything material, according to him, has either the positive or the negative polarity, the appearance of which varies with its base, being electricity in the air, magnetism in the metals, chemism in the salts, and galvanism in organic bodies. This he endeavors to prove is the law of the animal, vegetable, and mineral kingdoms. The deflection of the needle is due to two causes—other iron deposits than those which M. Jacquemin supposes to exist at the poles, the larger at the North; and, on the ocean, the excess of magnetic force in that limb of the terrestrial horseshoe which is formed by Europe, Asia, and Africa. This shape of the continents, he suggests, may be the effect of magnetism, as may also the obliquity of the earth in its orbit. Plants, the author asserts, are polarized in two opposite directions, magnetism pulling them down rootwards and galvanism lifting them up to the light and air. They have thus two extremities, but no centre, while the animal has his centre in himself. In both, the sexual functions are distinguished by polarity, and are related to each other as positive and negative electricity or positive and negative galvanism respectively. The author's illustrations in the case of animals are specimens of the French frankness in matters of this sort. Before he concludes, he contrives to demand the liberty of the press, to sketch the social and political condition of the United States and exhibit its rate of increase in population, and to advocate the abolition of standing armies in Europe. ——The eighth volume of Guizot's "Mémoires pour servir à l'Histoire de mon Temps" has just been published at Paris and Leipzig. In this volume the author describes his political activity as minister in the cabinet of Louis Philippe from 1840 to 1846, and publishes many notes from the king thanking him for his eloquent defence against the Opposition in the Chamber of Deputies, of which Lamartine was the leader; but he overestimates his importance in the state and his hold upon the royal esteem, conceals his part in the disastrous policy which preceded the Revolution, and is unwarrantably severe upon some of his yet living contemporaries. Bound up with the memoirs are two essays on foreign policy: "Italy and the Pope Pius IX. (1846–48)," "Switzerland and the Sonderbund (1840–48)," and one on the "Political Reforms of France from 1840 to 1848."

—The Low-German or Platt-deutsch dialect, which has hitherto been used conversationally only by the lower and middle classes of Northern Germany, has been recently brought by its poets and novelists into favor with the whole German population. With the exception of some newly added words from foreign roots, chiefly from the French, this dialect has remained intact since the time when, as yet, the Anglo-Saxons had not emigrated to England, but occupied the plains between the Weser and the Elbe. It was, in fact, *the* language for Northern Germany till Luther, by his translation of the Bible into the High-German—till then only spoken and written in Southern Germany—made the latter branch of the German language predominant. The Low-German, resembling by its Anglo-Saxon roots in many instances the Dutch and the English languages, passed gradually out of use in literature, and has but now come into fashion again. The Hamburg poet, Claus Groth, with his novel, "Quickborn," inaugurated the new epoch, and was soon followed by a still greater talent in this kind of literature, Fritz Reuter, who during the last six years has published twelve volumes of novels and poems in Low-German, and through these become at once a favorite with the German public—his poetical talent, power of expression, and poignant wit in his humorous works being, indeed, well worthy of our praise. He is, we might say, the Artemus Ward of Germany—poetical edition—and in that capacity is now decidedly in vogue. The boudoir of a German lady of *bon ton* would be incomplete if there were not on its table a volume of Reuter's lying by the side of the "Miniatur-Ausgaben" of Goethe's, Geibel's, Schiller's, Heine's, Freiligrath's, or Uhland's poems. But many of his admirers do not understand Platt-deutsch, and for those a little Low-High-German dictionary has just been published ("Wörterbuch zu Fritz Reuter's sämmtlichen Werken. Von Fr. Frehse." Rostock, 1867. L. W. Schmidt, New York). This glossary does not profess to be an etymological dictionary, but only a key to the perusal of Reuter's works. We quote from it a few words which exhibit the nature of the dialect: *Achter*, Eng. after; *as*, Eng. as, when; *att*, Eng. ate (imperfect of eat); *beter*, Eng. better; *quick*, Eng. quick; *olt*, Eng. old; *tru*, Eng. true; *wat*, Eng. what. Many more are written and mean the same in English and in Low-German; and others still, having the same root as the corresponding English words, with some variations in their spelling, have the same sound in both languages, as, for instance, *vull*, Eng. full; *wull*, Eng. wool; *kauh*, Eng. cow, etc. The Low-German has also this in common with the English, that it mostly combines the auxiliary verb "dauhn," Eng. do, with other verbs, which is not done in High-German.

—A German agriculturist named Häcker, who, in 1862–63, made a tour through the United States, after considerable difficulty has found a publisher for his observations ("Amerikanische Reiseskizzen aus dem Gebiet der Technik, Landwirthschaft und des socialen Lebens.' Braunschweig,

1867). He visited this State, Pennsylvania, the Western and South-western States, but not the Eastern, which could only have interested him in the last division of his subject. The technical part of the book treats of the manufacture of sugar and molasses from sorghum, of Indian corn and its various uses, especially as an ingredient for brewing beer after a new method, etc., etc.

—A comparison of the skull of the orang-outang, chimpanzee, and gorilla has lately been edited by Professor Bischoff, of the University of Munich, with an atlas of twenty-two lithographic plates ("Die Schädelbildung des Gorilla, Chimpanse und Orang-Outang. Von Dr. L. Th. Bischoff. Munich, 1867. L. W. Schmidt, New York). The author measured a selection of thirty-five skulls, and arrived at the following result in regard to their capacity: Gorilla, largest, 465 centimetres; chimpanzee, 460 centimetres: orang-outang, 575 centimetres. The last is said to be the largest monkey-skull ever brought to Europe, and was procured at Borneo by the "Novara Expedition," sent out by Austria. An interesting fact observed by Herr Bischoff is that most of the chimpanzee skulls had teeth infected by caries, from which he infers the possibility of this species being decrepit and on the point of becoming extinct. In conclusion, he expresses the opinion that Darwin's theory and enquiries have failed to prove the descent, or rather ascent, of man from the monkey, and that, if there are, as Huxley asserted, some links between the species of gorilla and man, they ought to be still in existence.

—When the Mongolians in the thirteenth century conquered all Eastern Europe, they were checked in their progress at last in the battle of Wahlstatt, on the 9th of April, 1241, and then flowed back to their Asiatic steppes. But on their retreat they took with them not material treasures only, but also intellectual ones, as Mr. B. Tülg asserts in his "Mongolische Mährchen" ("Mongolian Tales, in Mongolian and German. Edited by B. Tülg." Jansbruck, 1867). He communicates a fragment of a Mongolian tale, "Ardschi Bordschi," which, as appears from the annexed translation, is an episode—"Isolde's Ordeal"—from the Middle-High German epos, "Tristan und Isolde," written in 1210 by the Minnesinger Gottfried von Strassburg.

HOZIER'S SEVEN WEEKS' WAR.*

Mr. Hozier was the military correspondent of the London *Times* with the Prussian army during the German campaign of 1866. His style is clear, but shows in his earlier chapters some of the faults which are common to such writers, especially instances of the careless use of language; but such defects are much more rare as the book proceeds. His tone is uniformly good. He looks in a manly way at all the questions he has occasion to discuss, and his sympathy is always ready for gallantry and constancy, by whomsoever displayed, and he is especially prompt to note and praise every deed of charity and mercy that comes to his knowledge. In political sympathies, he seems to be on the side of Denmark in her contest with Austria and Prussia, and on the side of Austria in her contest with Prussia. In all matters which pertain to the art of war, in enlistment and organization, in arming, equipping, feeding, leading, and fighting troops, his admiration of the Prussian system and of its execution is open and strong.

The question how far his book, as a whole, will interest the American reader will depend very much upon the question how far each person cares for information as to the progress of the estrangement between the two great powers of Germany, and as to the preparations made by each nation for the struggle. Nearly a half of the first volume is occupied by introductory matter. The Schleswig-Holstein war, and the subsequent events which led to the final rupture between Prussia and Austria, including the Gastein Convention, its fruitlessness, and the final breach of it, the proposal of Prussia to reform the Germanic Confederation, and the manner in which that confederation after lasting for fifty years was finally broken up, are sketched very clearly and ably. The next four chapters contain a masterly statement of the strength of the powers which took part in the war—Prussia, Austria, the remaining states of Germany, and Italy. But though some impatient readers may be tempted to skip the first hundred and fifty pages of the first volume, no one who reads so far or who takes up the book at this point will fail to read to the end. The second volume particularly contains much of the most agreeable military writing to be found in the language. Page after page of fresh and picturesque description of the progress of the Prussian army through regions that to us are unknown lands keeps the attention ever alive, and at short intervals come accounts of the frequent battles in which the conquering Prussians overcame every effort of their enemy, and steadily caused the white wave of the Austrian army to recede to the fortifications of Florisdorf.

The story of the "Seven Weeks' War" is remarkable for the uniform success of the Prussians. It is true that the Prussian regular army, not counting the Landwehr, contained about ninety thousand men more than the total strength of available combatants in the Austrian army of operation, and that a considerable portion of the latter was diverted to the southern frontier of Austria to operate against the army of Victor Emanuel. And yet the Austrian army, acting on the defensive, and occupying a position which was generally central with regard to its opponents, was able to oppose to their attacks, as a rule, a force so nearly equal that the reason for the success of the Prussians is to be sought elsewhere than in disparity of numbers. On the shields borne by the figures of Victory which adorned the Unter den Linden on the day of the triumphal entry of the Prussian army into Berlin at the close of the war, were inscribed the names of thirty-eight engagements, the larger part of which were fought by the Prussians and Austrians, and yet in hardly a single instance, except the short-lived success of Marshal Gablenz, near Trautenau, did the Austrians gain any advantage, and even that at the price of a loss of nearly five for one in thousands. On one occasion a single Prussian battery, of six four-pounder guns, engaged twenty-four Austrian guns, and held its ground even when the Austrians concentrated the fire of sixty-four guns upon it. When we read of such accounts as these, and the returns of the killed and wounded on either side in each engagement, the Austrian loss being always very much greater than the Prussian, and then remember how stubbornly Austria contended with France in the Italian campaign of 1859, it is easy to see what a significance the story of this war must have for France. Wherever and however the Prussians engaged the Austrians, the Prussians were successful. Prussian skirmishers, Prussian infantry, Prussian artillery, Prussian cavalry, were too much for their Austrian opponents of the same arm. One day some Prussian uhlans and some Austrian hussars charged each other in the street of the little town of Saar; the Prussian lance had the better of the Austrian sword. The next day, at Tischnowitz, some Prussian dragoons had an encounter with some Austrian lancers; the Prussian sword had the better of the Austrian lance. The success of the Prussian forces was, indeed, so uniform that the story of the war becomes a little monotonous on that account. It must be confessed that the army of Prussia is represented by Mr. Hozier as an army of almost inconceivable excellence, and that, if we are to take his account of it as literally correct, we must regard the ranks as filled with men who resembled Bayard in blamelessness of life as well as in fearlessness. Not only are such evils as cowardice and desertion seemingly unknown in the Prussian army, but there is not so much as a suggestion of such things as intemperance, straggling, insubordination, violence, or plundering. The bureau of military justice is not known, so far as the author tells us, in the Prussian army. Another thing which is very noticeable is that every Prussian officer sent on detached service, whether on a great scale or on a small, appears to have been fully equal to his trust. Eagerness to obey and capacity of obeying, united in the same man, seem to have been the rule. The general impression left upon the mind by a careful reading of this book is that the military system of Prussia is conceived and put in execution in the highest spirit, and it creates a profound sense of the wisdom and vigor of the nation that possesses it.

Mr. Hozier is of the opinion that Prussia is incomparably the superior of Austria in her military system. The success of Prussian troops when actually engaged he attributes to the greater size and strength of the individual Prussian, and to the greater efficiency of the breech-loading arm. He thinks, however, that a degree of importance has been awarded to the superior armament of the Prussians which is not wholly merited, and he is not inclined to believe that the needle-gun is the best breech-loader known, however superior it may be to any muzzle-loader.

There was a great deal of sharp and sanguinary fighting in the Seven Weeks' War, though blood did not flow there as it has often flowed in this country in recent times, but such names as Podoll and Gitschin sound strange and unfamiliar to us. The interest of the war is centred in the great battle fought between the Bistritz and the Elbe, around the cottages and orchards of Sadowa, in the woods of Lipa, and almost under the guns of the fortress of Königgrätz. Mr. Hozier's description of this great battle is rather disappointing. It is perfectly clear, and so far satisfactory, but it is rather brief, and rather wanting in picturesqueness. In reading many of his descriptions, one feels sure that he was present and saw what he describes

* "The Seven Weeks' War. Its Antecedents and its Incidents. By H. M. Hozier, F.C.S., F.G.S. (Based upon Letters reprinted by permission from *The Times*.) In two volumes." Philadelphia: J. B. Lippincott & Co. London: Macmillan & Co. 1867.

so well, but his account of the battle of Königgrätz suggests a doubt whether he was on the field.

About sixty miles east of Prague, the Elbe flows for a considerable distance in a southerly direction before it commences its long journey towards the German Ocean. Upon its eastern bank stand the fortresses of Josephstadt and Königgrätz. At a mean distance of six miles to the west, and nearly parallel to it, flows the little stream of the Bistritz. Between these two rivers, on the night of the 2d of July, 1866, General Benedek assembled his army, and took up a position between the town of Königgrätz and the latter. His successive defeats had cost him already forty thousand men. He felt unequal to assuming the offensive, and he seems to have chosen a defensive position, where he might retain the power of resuming the offensive should fortune favor him. On the evening of the 2d of July, Prince Frederick Charles, commanding the first Prussian army of one hundred thousand men, received such information at Kaminietz, where his headquarters then were, at a distance of some twelve miles north-west from the Bistritz, as led him to infer that the Austrian commander intended to advance the next day from that river, with the object of attacking his command with superior force, before its junction with the second Prussian army under the Crown Prince was practically effected. He determined to move his troops forward, to secure a favorable position in which to receive this attack, and he sent orders to General Von Bittenfeld, who was on his right, with the army of the Elbe, numbering some thirty thousand men, to advance with his command, and be prepared to attack the left of the Austrian column of advance, while he assailed its leading divisions. At the same time, he sent to the Crown Prince, whose heads of columns were ten miles or more to his left and front, requesting him to push forward in the morning with one corps and attack the right flank of the Austrians, while he himself engaged them in front. The King of Prussia, who had in person assumed command of the three Prussian armies on the first of July, approved this plan, and, further, ordered the Crown Prince to advance in the morning, not with one corps alone, but with all his available forces.

The troops of the first army moved long before midnight, and at a little after midnight they were all concealed in a hollow about four miles from Sadowa, the village at which the main road to Königgrätz crosses the Bistritz. No Austrian scouts or skirmishers made their appearance, and fears began to be entertained that Benedek meant to cross the Elbe in retreat, and protect his right flank against the attack of the second army by covering it with the fortress of Josephstadt. It was necessary for the success of the Prussian plans to hold the Austrian army in front of the Elbe, and Prince Frederick Charles resolved, with his own army alone, to engage the whole Austrian forces, and attempt to hold them on the Bistritz till the Prussian flank attacks could be developed. About four A.M. the army began to advance. The air was thick and hazy, the rain came down steadily, and the wind blew cold. When the soldiers of the first army reached the crest of the hill on which stands the village of Dub, two miles nearer Königgrätz, there was nothing between them and the Bistritz but a gentle slope, a mile and a quarter in extent. Beyond the river lay the Austrian army. General Benedek had arranged the bulk of his forces in a line parallel to this stream. His front was covered by its marshy banks. His centre was on high ground in front of Chlum. His right was bent back, and was covered to a certain extent by a brook and marshy ravine. His left was supported by the wood and castle of Hradek, and his left centre was strengthened by possession of the villages of Problus and Prein. As reserves, he had in rear of his centre the first and sixth corps, and the first and third divisions of reserved cavalry. The extent of his front was nine or ten miles. The troops which he brought into action amounted to about two hundred thousand men, with six hundred guns.

At seven o'clock in the morning of the third of July, Prince Frederick Charles pushed forward some of his cavalry and horse-artilllery. They drew the fire of an Austrian battery, and at half-past seven A.M. the battle of Königgrätz began. For more than two hours almost all the fighting was done by the artillery. This was the best arm of the Austrian service, and at ten o'clock the Prussians had made hardly any progress. At ten, an advance of the Prussian infantry, in the centre and on the left, was ordered, and after an hour or so of very hard fighting, the Austrians were driven from the advanced posts of their right and centre. Their main line was now formed a little higher up the hill, and the advantages of their position and the stubbornness of their fighting were such that for the next three hours the Prussians could gain little ground. At one o'clock their whole battle-line stood still, and was obliged to fight hard to retain the position it had won. The large reinforcement of two divisions which were now sent in failed to reach the enemy. Von Bittenfeld was checked upon the right. Benedek, who had heard as early as ten o'clock, or thereabouts, that a corps from the second army was threatening his right, was preparing a counter-attack upon the Prussians, with the hope of dealing a severe blow to the first army before the second could be brought into action. At three o'clock there were no signs perceptible to Prince Frederick Charles of the advance of the second army. Things looked critical for the first army. One of its divisions was withdrawn from the front, and cavalry was pressed up, and this may have been for the purpose of making them available, in case of need, for retarding the Austrian pursuit.

Victory was nearer to the Prussians than the king and the generals of the first army knew. The Crown Prince, with the second army, had been engaged with the Austrian right since half-past twelve o'clock. The undulations of the ground concealed them and their movements from the generals directing the first attack. When Frederick Charles and his officers were most uneasy at Sadowa, some of the soldiers of the Crown Prince were already in the heart of the Austrian position. The very success of the Austrians on the right centre had opened for these soldiers a path to the key of the Austrian position, and to victory.

Though a large part of the Austrian army was drawn up in a straight line parallel to the Bistritz, the right was refused, and two corps were curved round so as to form almost a right angle to the general position. The troops opposed to the extreme left of the attack of the first Prussian army were those which were posted at the commencement of the curve. They succeeded in repulsing the attack and driving the enemy back, and remained engaged with their opponents on the ground to which they had advanced. Thus it happened that the weight of the attack of the second Prussian army fell on a single Austrian corps. When this was pushed back it retired toward its right rear. Thus, as the left corps of the Austrian right wing had advanced to its left, and the right corps was forced from its position, and retired to its right, a gap was left in the Austrian line, and through it the first division of the Prussian guards marched, and, passing for a distance of about two thousand paces along the rear of the Austrian battle, moved straight to the hill of Chlum. Every effort of Benedek to retake the hill proved unsuccessful. Reinforcements soon came to the gallant band of twelve battalions who held this vital position, and who for a while withstood the shock of the whole reserve of the enemy. The first army, learning that their comrades were in the enemy's rear, swept forward in an irresistible advance. The battle was won in a moment, and it was only with heavy loss and by the greatest display of skill and bravery that the Austrian army was withdrawn beyond the Elbe and to the protection of the guns of Königgrätz.

The number of men and guns engaged in this great battle was about the same on each side, though the Prussians had in the immediate neighborhood about sixty thousand men and many guns belonging to the second army which were not engaged. Four hundred thousand men fought to decide whether Prussia or Austria should take the first place in central Europe. The Austrians lost in prisoners twenty thousand men, and about the same number in killed and wounded. The total loss of the Prussians was not ten thousand. Decisive as this action was in its results, it was, with hardly an exception, the most bloodless of all the great battles fought in Europe for the last two centuries. Its interest lies rather in its consequences than in the manner in which it was fought. When the armies of two nations are such, in men, discipline, arms, leading spirit, or what not, that one hundred and thirty thousand men of the one can attack two hundred thousand of the other in a selected and strengthened position, and hold their attention so completely for several hours that another force of one hundred and thirty thousand men of the former nation may be left free to place itself upon the flank of the army in position, the result cannot be doubtful. The first five hours of the battle of Königgrätz proved that the Prussian armies could encounter the Austrian armies with a fair prospect of success when the Austrians outnumbered them nearly two for one. It seemed hard to believe, when the news of the battle first came, that a great military nation should regard the issue of a most momentous war as determined by a single defeat, in which her total loss was twenty per cent., and her loss in killed and wounded only ten per cent., of the number that went into the action. It is no longer hard to understand. The battle of Königgrätz must have shown to the Austrian Government what it may well have feared for a few days or weeks before, that the armies of Austria were no match for the armies of Prussia.

No room is left in which to speak of Mr. Hozier's account of the operations in the Western theatre of the German war, or of the war in Italy, where the Italians were defeated on land at Custozza, and by sea at Lissa. It must suffice to say that the work is altogether well done, that the contents of both volumes are instructive, and that much of them is in a very high degree delightful reading.

COLLEGE LIFE—THEORY AND PRACTICE.*

THE first half of this book consists of lectures delivered before the undergraduates of Wesleyan University by Dr. Olin, the late president of that institution, and the remainder of it is made up of baccalaureate discourses delivered by him at the same place. Our criticism will be mainly occupied with the ideas pressed or implied in the lectures, as the sermons contain nothing germane to questions that are now agitated in the thinking world, and consequently are of no general interest.

Those who are interested in the dispute at present existing between those educational theorists who uphold the paramount importance of the study of the dead classical languages as a means of mental culture (and our remarks will be mainly *à propos* of this discussion), and those who, being dissatisfied with the traditional system, wish to substitute for it a new one, in which natural and political science shall have a larger share than they at present possess, should read this book in connection with that recently edited by Dr. Youmans, called "The Culture Demanded by Modern Life." The two books represent—the one by assertion, the other by implication—the two theories.

The object of the author of these essays was, through their means, to stimulate the young men under his care to earnest study. With this object he placed before them what he considered the proper theory, mode, and end of collegiate education. "Educational institutions," said he, "are organized and conducted on well-established philosophical principles, no less than in accordance with the lessons of experience and the exigencies of the current time." What these philosophical principles are must be gathered from the general tenor of the lectures, as they are nowhere distinctly stated. It will surely be allowed us to state one of them thus: Since the object of education is such a mental culture as will best fit those who are the recipients of it to perform all the duties for which it is possible by mental training to prepare them, therefore the curriculum of an institution for educational purposes should be planned in such a way as will best attain this end.

From this statement it inevitably follows that, if the duties of a young man in the nineteenth century be essentially different from those of a young man in the fifteenth century, his education should be different. If the duties of educated men at that time were mainly ecclesiastical, and if they be now mainly scientific and political, the modes by which they are prepared for usefulness should be different.

In the fifteenth century there was, for instance, a demand in England for a culture which the old Trivium and Quadrivium could not supply; consequently men who, like Collet and Grocyn, desired to study the Greek language and literature were obliged to seek it elsewhere, and they found it in Italy. The opposition to the introduction of this study in the English universities was so great that it was not without long and wordy contention that the "Greeks," as they were called, headed by Erasmus, who had come from Rotterdam with the laudable purpose of instructing the English in this branch of learning, succeeded in obtaining for it a foothold at Oxford. Greek was then demanded, and Greek was obtained; so science, being now wanted, should be forthcoming in places where we have a right to look for it. Too sturdy and headstrong a refusal to supply it will inevitably end disastrously for that which opposes it, whereas, if science and literature of all kinds be allowed to take each its natural place, there will be no jar or confusion, and no marring of the beautiful entirety of what would then be a liberal education. As Collet was obliged to go to Italy for Greek, so is it now a fact that for a tolerably thorough scientific education our young men are obliged to go to France—a grievance which loudly calls for redress.

But it is wise to offer innovating propositions with diffidence, certainly with courtesy. Let no class mistake its ruling idea for the larger spirit of the age. So many educational theories have been lauded to the sky, been tried and found incompetent, that they who have a theory on this subject should thoroughly digest, and perhaps try it on a small scale, as Robert Owen tried communism, and see whether or not it will work, before pressing its claims upon the attention of the public, which is always waiting, with open ears, to hear any new theory in regard to that vexatious question of the improvement of men—the "amelioration of their condition," as it is called. There was a time when Rousseau's "Emile" and the Lockian system had such a widespread influence that even the prejudices of religious systems were unable to withstand it; and we find an American Methodist conference, considering in regard to the best mode of educating young men in Methodist institutions of learning, saying that there should be in them "nothing which the world calls play, in accordance with the views of two of the greatest men of any age, Mr. Locke and Mr. Rousseau!" Think of Rousseau classed with Locke and considered authority by a Methodist conference! Those who are in love with the Positive Philosophy will lay great, and perhaps too great, stress on the study of positive science; but there is danger that they will neglect much which is valuable because it is not in the universe as reduced by M. Comte. "The heavens declare no glory save that of Newton and Laplace," is doubtless a great saying, but doubtless, also, it does not close debate on that question.

There seems to be little doubt that some very grave cause of complaint exists against our colleges and universities. There is, even among the students themselves, a growing discontent with the routine through which they are forced to go. It can also hardly be denied that there is seldom so helpless a class of men cast upon society as a newly graduated class of college students. They feel, instantly they come in contact with the matter-of-fact world, that they have not so good a chance of success as men who have never been at college; that they have not the qualifications necessary to meet successfully the responsibilities in the midst of which they so suddenly appear—as it were from another world. In such a government as ours, where any man may at any time be called upon to perform important practical duties, education should give its recipients at least the theory of those duties. The science of political economy is hardly studied at all in our colleges, although this is one of the studies with which an American should be most conversant. At college a man who has read and can "talk" Stuart Mill is looked upon as quite a great man, while one who has gone so far as to read Adam Smith is a prodigy.

The French language, in which so much that is important in science of all kinds is contained, is generally pursued as an optional study, and but very little stress is laid upon it by college authorities. If a man were tolerably acquainted with French scientific literature from the middle of the eighteenth century till the present time, he would be possessed of such a fund of practical knowledge as would throw even the ordinary run of college professors, much more students, into bewilderment.

But science is strictly utilitarian in its objects, and employs but one department of the nature of man. Although at its two extremes it touches metaphysics, and sometimes rises to the grandeur of poetry, yet these are not its appropriate spheres of action. It was a favorite maxim of Montesquieu that "power is ever at war with its own boundaries," and in nothing can the truth of this saying be more clearly seen than in the endeavors of science to crowd metaphysics and poetry out of existence, or, at most, to give them a little ground where they may lie down and die in peace. The fact that this is a reaction should deter scientific men from carrying it to extremes. To exaggerate a principle is to weaken it. Our college curricula do not need less classics and metaphysics and more natural science, but they need more of all three. The great fault of American education is its superficiality. Our common-school system is defective in this very way. A great many people are educated a very little; perhaps with the idea that if, like Micky Free's father, they can get their heads and shoulders out, they can easily extricate the rest of their bodies. Our boys get just enough of education to fit them for "going into a store," and our girls enough to enable them to misspell love-letters and read novels. "A little Latin and less Greek," and yet less science, and a large amount of pretence and self-assertion, make up generally the acquirements of our candidates for the degree of Bachelor of Arts. Two or three years of contact with the world are generally sufficient to rub off these superficialities, and our college graduates are then much the same as men who have had none of their "advantages," unless, indeed, it be an advantage to know how useless our college education is.

* "College Life. Its Theory and Practice. By Rev. Stephen Olin, D.D., LL.D., late President of Wesleyan University." New York: Harper & Brothers. 1867.

SAMUELS'S ORNITHOLOGY.*

MR. SAMUELS was right in thinking that his treatise on birds would meet a real want; and the faithfulness with which he has done his work, and the modesty with which he presents it to the public, would indispose us to severe criticism, even if his success were far less than it is. But the book is really a very excellent one, of just the character needed. Free use is made, and ample credit given, of the observations of earlier naturalists—Nuttall, Wilson, etc.—though we are surprised that the interesting articles in *The Atlantic Monthly* are not noticed.

The descriptions of the birds, their distribution and habits, and especially their eggs, are brief, clear, and accurate. We are sorry to miss some of the popular names of birds; among them some of those best worth preserving: as *veery* (Wilson's thrush), *linnet* (purple finch), *fife-bird* (white-throated sparrow), *red mavis* (to our thinking the best name of the brown thrush).

* "Ornithology and Oölogy of New England. By Edward A. Samuels, Curator of Zoölogy in the Massachusetts State Cabinet." Boston: Nichols & Noyes. 1867. 8vo, pp. 583.

The songs are less satisfactorily treated. The songs of the Baltimore oriole and the bay-winged finch are not even mentioned. The song of the warbling vireo is described as almost exactly resembling that of the purple finch, which, to be sure, it does in *quality* of tone, but not at all in the notes, the finch being a very rapid singer, the vireo a rather slow one. The song of the brown thrush, he says, seems to be "a sort of confused mixture of the notes of different birds;" but, in fact, this fine singer has a song which is exclusively his own, resembling no other but that of his cousin the cat-bird. Mr. Samuels decides the vexed question as to the hermit thrush by saying that his habits, song, etc., are "almost exactly similar to those of the song [wood] thrush," a decision which we do not believe is the correct one.

We are not disposed to censure the editor for the manner in which the book is illustrated, because we know that the task set before him was one which could not be accomplished—an illustrated book of birds which should cost only fifteen dollars. We do not know that he could have done much better for this sum than he has done; we think, however, that he might have shown better judgment in the selection, and will make a suggestion which may be of service for a new edition. Those who buy a book of this character wish for illustrations only for their scientific value, to help in determining a bird or an egg. For this purpose what is required is not absolute completeness, but accuracy and system; whatever is done should be upon a plan. If we cannot have a full-colored plate of every bird, such as Audubon gives—as we certainly cannot for fifteen dollars—we hardly care for full-colored plates at all, but should very much value a series of cuts giving a clear and distinct idea of the characteristics of the families and classes. Again, if the eggs are to be given at all, they should be all given—all, that is, except the pure white, and they, perhaps, in outline. Four plates, containing the eggs of thirty birds out of nearly three hundred, are of scarcely any value except as pretty pictures. It ought to be said that these plates of eggs are admirably done, and we urge Mr. Samuels very earnestly to go on with this special work he has so well begun, and publish as an appendix a complete set of colored plates of the eggs of every bird in his book; we believe it would find a large sale, and it would be a very valuable contribution to natural history. The figures of the birds are well enough, although far from equal to the eggs; but we wonder on what principle of selection the snowy owl, the crow, and the crow blackbird were selected for *coloring*. Indeed, the impression left by the illustrations, as a whole, is that they were meant to catch the eye, not to convey instruction.

Recent Republications.—The sixth annual edition of "Harper's Hand-book for Travellers in Europe and the East" appears as usual at this season. Two years ago we criticised the plan of this guide, and found fault with the proportion of space allotted to the various countries, and suggested some omissions by which space might be gained. We do not discover any essential change since then. Seven pages have been inserted descriptive of the Paris Exposition, and giving a plan of the building, but this is almost the only indication of the yearly revision by which the publishers distinguish theirs from other European guide-books. Though at any time within the past six months it has been evident what would be the extent of the North German Confederation, the editor, in half a dozen lines, alludes to the political revolution in Germany, and postpones any account of it till next year. Austria's limits are quite definite, and have been since last summer, but the account of her is not varied from that which answered before the Seven Weeks' War. In Venice we are told the nature of the Austrian rule, and may suppose that Venetia is still a province, till a correcting line is thrown in at the end. South Germany is put by itself, as politically it should be. The few pages devoted to the United States are so clearly gratuitous, and necessarily imperfect, that we still wonder they are retained, especially as they have to compete with the very full, very accurate, and seemingly conscientious "Hand-book of Northern Travel" published by the Appletons, of which the ninth annual edition has been sent us. The only criticism we have for it is, that it follows perhaps too closely the railroad lines, so that out-of-the-way places, which the judicious tourist would select if he knew their attractions, are not sufficiently described. Thus the Housatonic Valley, in Massachusetts, is very inadequately praised, and, in fact, must be looked for under the head of Connecticut, as Burlington under the head of New York. So the Dixville Notch in New Hampshire, no longer rarely visited or obscure, demands more particulars, especially as it is fully the peer of the other two great notches of the State. And the Umbagog, lowest of six or seven connected lakes that empty into the Androscoggin, and the natural corollary of the Dixville Notch to one going east, deserves specification beyond what it receives. The same may be said of the Au Sable River in this State. But we are aware that each person has his pet resorts, and is liable o set too high an estimate upon them.

Mrs. Ellet's "Practical Housekeeper" has been brought out afresh, in elegant style, by Mr. W. A. Townsend, who first published this work in 1857. Since then it has been revised, and to a considerable extent rewritten, and now offers five thousand practical receipts and maxims, illustrated by five hundred wood-engravings. Mrs. Ellet begins at the beginning, *i. e.*, with the house, furnishes it—more expensively than is necessary for some folks—sets the table, directs the mistress, directs the servants, takes care of the children and the sick, goes to market, carves the meat, describes thoroughly all the details of household economy, and then brings forward her receipts—one hundred and eighteen, for instance, being for soups. She tells how to tie a secure knot, to fold a napkin, to filter liquids, to cut glass; she gives a monthly bill of fare for all the year; and has space for cosmetics, salves, hair dyes, and a "family medical guide," which will not be found superfluous, or, as a whole, untrustworthy. Mrs. Ellet has written, we should say, for the more wealthy rather than for the less, but persons of moderate means can easily omit from her recipes the ingredients which are only epicurean. Wine and brandy are among these, often enough to cause a little surprise when the author prefaces her account of beverages with a "testimony" against the use of spirituous liquors.

Messrs. Ticknor & Fields seem to have judged rightly that the publication of Dr. Hayes's last work, "The Open Polar Sea," and the interest manifested in it, rendered advisable a republication of his "Arctic Boat Journey, in the Autumn of 1854"—not '64, as we said the other day in announcing the book. This has been handsomely accomplished, with the addition of engravings and charts, and of notes by the author which, by reference to his latest explorations, lend a completeness to the narrative which it could not have before. In his concluding chapter Dr. Hayes develops the thesis that the dangers encountered by Arctic travellers are generally less than those encountered by travellers in Africa.

"Living Age" is an exact description of the contents of Volume XCIII. of the popular serial which bears that name. Not only the literature but the politics of Christendom during the last quarter is here placed on record, and the owner of the book has history and criticism, the important facts and the best opinions, bound together and fit for preservation.

Bulwer's "Eugene Aram" is the latest volume of the Globe Edition of Messrs. J. B. Lippincott & Co., to which we have already alluded. It is full-bodied but not clumsy, and the print is excellent.

Messrs. Harper & Bros. have united in one volume Thackeray's lectures on the British Humorists and the Four Georges, hitherto published separately. More entertaining reading it would be hard to discover, or a more agreeable way of studying history from the political and the literary point of view.

A Manual of Marine Insurance. By Manley Hopkins. (Philadelphia: J. B. Lippincott & Co. 1867.)—This is a treatise published both in England and America, setting forth the general rules of marine insurance as they are understood by underwriters and average adjusters in Great Britain. The author is thoroughly familiar with his subject, and writes with the ease to which such familiarity is indispensable. Very few legal authorities are cited, but the substance of the law on the subject is stated with unusual clearness and accuracy. Merchants will find in it a more concise, comprehensive, and comprehensible statement of the law and customs of marine insurance than in any other book with which we are acquainted; while lawyers will get many new ideas from it, and derive from it a view of the mercantile side of questions which will throw much light upon their drier legal studies. The typography is in Spottiswoode's usual admirable style, which tempts one to read for the mere sake of enjoying the print.

The People the Sovereigns. Being a Comparison of the Government of the United States with those of the Republics which have existed before. By James Monroe. Edited by Samuel L. Gouverneur. (Philadelphia: J. B. Lippincott. 1867.)—This is a fragmentary work of Ex-President Monroe, put into shape by his grandson, and published for the first time nearly forty years after his death. It consists of two parts, the first containing reflections upon the capacity of the human race in general for self-government, and the second containing a review of the ancient republics of Greece and Carthage. Mr. Monroe was a highly respectable, but not brilliant statesman; and therefore no one will be surprised to find that his ideas are not very profound, nor remarkable for originality. Those, however, who desire to know the views of one of our early statesmen upon the subject of republican government, may find some matter of interest in the volume.

The Code of Procedure. (New York: Diossy & Cockroft. 1867.)—This is an extremely neat pocket edition of the Code, without notes. Its smallness, cheapness, and clear print must make it very acceptable to lawyers and others.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

SOUTHERN POLITICS.

Tennessee has just given decisive evidence of the comparative unanimity with which the newly enfranchised voters at the South support the Republican party, and has effectually dissipated whatever hopes might have been entertained by politicians of the Democratic party of a division and neutralization of the colored vote. There were grounds for such a division in Tennessee that did not exist in any other State. There is a large loyal white population, many, if not most, of whom have, until a very recent period, entertained a strong dislike for the negro, and have been unwilling to render him the simplest justice. So long as they believed themselves able to keep down the rebel element without the help of colored men, they scouted the idea of universal suffrage. And when they were compelled to choose between this and political extinction, they delayed their decision until the opportunity for choice was nearly lost. These remarks do not fully apply to Governor Brownlow and a few others, who, on this point, were in advance of their constituents, but they are perfectly true of the great majority of white loyalists, in or out of office. It could not be expected that such a course would of itself command the confidence of the colored people when finally enfranchised; but although the "Conservatives" strove hard to impress the new voters with the insincerity of the Radicals, it appears that at least nine-tenths of the colored vote has been given for the Radical ticket.

We have no desire to underrate the difficulties of the Tennesseean Unionists; but we submit for the consideration of all calm and intelligent men whether it is possible to protract very much longer the *régime* which is now established in Tennessee, and of which Governor Brownlow is unfortunately the representative. We acknowledge to the fullest extent the value of what the Unionists have done; but the main object and the only good excuse for their exclusive domination—the establishment of law and order throughout the State—they have not yet attained. Society there has, during the whole term of Governor Brownlow's administration, been in a condition bordering on anarchy. The militia he has called out have, from the necessity of the case, been themselves fierce partisans, and have therefore wanted the first essentials of a good police—impartiality and discipline. Therefore it is fair to say, that the Radicals have not fairly discharged the duties which every party that takes to itself the exclusive control of the government of a State assumes by implication. It undertakes to maintain order, and protect life and property, by the mere fact of its excluding its opponents from the polls; and in case of failure to meet these responsibilities, it is no answer to allege the wickedness and turbulence of the malcontents. This wickedness and turbulence were part of the problem with which those who took charge of the government engaged to deal, and, in fact, furnished the main reason for confining the government to a portion of the population. When Governor Brownlow says the State is torn by strife and disorder because the rebels are so bad, he talks like a general who excuses his defeat on the ground that the enemy fought too hard.

We do not seek to censure the Radicals too severely for their shortcomings. It would have been absurd to expect men who had gone through what they have gone through to sit down the minute the war was over, forgive their enemies, and administer the government on philosophical principles. Men will be men; and we confess that, for our part, we think half the moral value of such a struggle as the country has passed through would be lost if people were to set about forgiving and forgetting as soon as the last shot was fired. No society could either last very long, or be worth the trouble of saving, in which rascals and traitors and murderers ceased to be detested as soon as they lost their powers of mischief, and in which men had learnt to bear the most atrocious wrongs without feeling any resentment against those who wronged them. The adoption of any such rule in politics would end in giving the scoundrels the control of the world. Therefore, when Brownlow and his loyalists devoted themselves two years to cursing, abusing, and "running off" the Tennesseean rebels, we could not greatly blame them. Now, however, they have a majority of voters on their side; they have proved their ability to keep order at the polls, and we submit that the country is fairly entitled to expect something from them in the way of pacification and conciliation. Whether Governor Brownlow is capable of any such work we greatly doubt, but if he be, his friends are bound to urge it upon him by every means in their power.

In the other reconstructing States the few white loyalists have been so long in harmony with the colored people that none of these difficulties stand in the way. The Union Leagues are spreading with great rapidity over the entire South; and it is probable that by this time a majority of the electors are enrolled in these or kindred political organizations, and have pledged themselves to support the Republican party. We see that in South Carolina the only colored man who ever publicly hinted a doubt as to the course which his race should take, has fallen into line with the rest. Everywhere the colored people are at least as nearly unanimous upon one side as the Irishmen of New York are upon the other.

It is eminently creditable to the newly enfranchised race that every element of trouble in their political affairs has its origin among white men. We do not know of a single unreasonable demand made by any body of colored politicians of their own motion; and they have had good sense enough to reject some temptations put in their way by bad or foolish white men. One man in the South Carolina Convention was silly enough to propose a demand for a colored Vice-President next year; but the wisdom of his associates promptly extinguished this firebrand. Wherever there is any real trouble, it will, we predict, be generally found that some ambitious or selfish member of the "superior" race is at the bottom of it.

Virginia affords an unfortunate illustration of this fact. The Republicans of that State are kept in constant ferment by the anxiety of a few white men to keep the entire control of the party in their own hands. Their recent proceedings at Richmond seem to indicate their desire to keep the party conveniently small. The idea of calling a *State* Convention, and then urging the residents of the city where it is held to attend it in mass, is either grossly dishonest or absurd. Such a convention, of course, represents at most only the city—not the State. But when, after calling in a mob from the streets, they exclude respectable citizens, elected from other districts, on the ground that the meetings at which they were chosen were not regularly called, the thing becomes doubly absurd. If the convention was a literal mass meeting, any one had a right to come in. If it was not, then the Richmond mob should have been kept out. It is obvious that the managers of such schemes are actuated more by a thirst for office than by a sincere desire for the public good.

The evil that may result from such a narrow-minded policy is almost incalculable. It is of the utmost importance that a large portion of the white electors should co-operate with the colored people in support of the Republican party. There is scarcely a State, except South Carolina, which can be controlled by the colored vote alone for more than two or three years. Certainly Virginia is not one of that class. The white voters will constitute a majority whenever they choose to act together; and they will probably increase far more rapidly than the others. Immigration will soon flow in that direction; and this, of course, will be exclusively white, and in great part unfriendly to the colored people. To reject the proffered alliance of a large class of respectable white residents, and to deny them their fair share of influence and position, is an act of short-sighted folly that will react severely upon the freedmen, if they are ever persuaded to commit it. They ought not to be *subservient* to their white neighbors, nor to submit to their dictation in political matters; but when an opportunity is presented for securing the co-operation of both races upon fair and equal terms, it is the duty and the interest of the colored people to accept it, and those are not their sincere friends who throw obstacles in the way.

The South Carolina Republican Convention adopted (among other things) a resolution favoring the greater subdivision of landed property, which has excited some unfavorable comment on the ground

that it was intended to open the way for confiscation. Our views upon that point need no repetition; but in order to comprehend the motives for a resolution of this kind it is necessary to know something of the way in which land is held in the South. Immense tracts, including nearly all that is really available for cultivation, are held by men who were, before the war, rich in land and slaves. All their wealth apart from the bare soil is swept away; and a large proportion of them have neither the means nor the energy to cultivate their waste land. They hate "Yankees" and negroes too bitterly to tolerate the idea of leasing farms to either of these classes, who alone have ability to make a profitable use of it. They are too proud of their territorial possessions to sell any part of them. In short, they are like the dog in the manger—they can make no use of the land themselves, and they will not suffer any one else to do so. Eminent political economists have asserted the right of the State to interfere in such cases; and the colored people, without being able to reason out the matter as fully as Mr. Mill has done, have instinctively reached the same conclusion; and most Northern men who have settled in the South sympathize with their dissatisfaction at such wholesale waste.

Confiscation is not needed to cure this evil, nor do we believe that the Southern Republicans will ask for any such remedy. But they will be very likely to pass such general laws as will make the possession of large waste tracts so burdensome that the owner will be very glad to sell them. If in doing this they act under good advice, and pass just and equal laws for the purpose, they will relieve the South from a great incubus on its prosperity. If they resort to oppressive and unfair legislation, they will injure themselves by driving away capital.

WAGES AGAINST CO-OPERATION.

A STRONG argument against co-operation, from the pen of M. Batbie, a French economist of distinction, appears in the *Revue des Deux Mondes* of June 15. He declares the main objection to wages, on the part of French workmen at least, to be their false notion that there is a certain social degradation in living by them, and then proceeds to show, which is, of course, not a very difficult matter, that payment in wages is, *per se*, as honorable a mode of payment as any, inasmuch as wages are in reality simply the sum for which the workman agrees to sell in advance his share of the products of labor and capital, making due allowance for the guarantee against all risk which the capitalist gives him. But we do not believe that in France, any more than in other countries, this idea of the degradation of living by wages is confined to workmen. It pervades all classes of society, and it is because it pervades all classes, and not because they hold it themselves, that workmen are restive under it. Owing to various circumstances, which we cannot enumerate here, the man who is hired by another to do certain duties is looked upon as, in a certain sense, his servant; and the position of a servant, whatever it may become hereafter, is not now considered that of a man who sells his commodity called labor, but of an inferior living in subjection to, and sacrificing his will to that of, a superior. Nor is this feeling confined to Europe; it exists here, and shows itself in every field of labor. It disposes many classes of employees to incivility, as a sort of protest against the popular definition of their condition. Moreover, it is universally recognized that the man who is "in business for himself," as it is called, occupies a higher social position than the man who works for another, and almost every man who has any ambition or energy endeavors, as rapidly as possible, to quit the position of an employee. In fact, men escape from it here with greater eagerness than they do in Europe, because there are more openings by which to escape, and, there being more openings, the spirit of hope and audacity, and the readiness to take risks, are more widely diffused. It is a rather rare thing in this country to see an elderly man in the position of clerk in a commercial house. In Europe nothing is more common, and there are few things which put the difference in the social condition of the two countries more distinctly before the mind of an observer than this contrast.

This feeling of dislike to wages, therefore, is not, as M. Batbie insinuates, confined to artisans or to France; nor is it, as he maintains, altogether silly. Living by wages no doubt means that a workman has commuted in a fixed sum for his share of the product; but it also means that he is subject to another man's will, and that it depends on his success in pleasing him whether he shall have any share in the products at all. This growing disinclination to be subject to other men's will, or, in other words, the growing dislike of obedience to arbitrary commands, is one of the most marked phenomena of modern society. It is a constant subject of lamentation with conservatives; but we confess we see in it not only nothing to deplore, but much to rejoice over, for we regard it as one of the signs that we are making progress toward the time when men's lives will be largely regulated by their own cultivated reason—when pains and penalties imposed by earthly superiors will be of little or no value. We see no prospect, in fact, of ever reconciling men to submission to the will of individuals, on any theory of morals or political economy, without a radical change in human nature. The history of progress is simply the history of a revolt against this *régime*.

M. Batbie also holds that in reality the great mass of workmen do not desire co-operation, that co-operation involves risk, and that what a workman wants, to ensure his comfort and peace of mind, is fixity in his wages. Unless he knows how much he is to receive every month, he cannot tell how much he may spend, how much he can save. There is nothing so intolerable to most of men and women as uncertainty about their means of livelihood; even the tenants who, in Italy and Southern Europe, work farms on the métayer plan are always ready to accept fixed wages instead of a share of the crop, in order that they may be able to save systematically, and thus acquire the means of purchasing a piece of land of their own. It is only choice workmen, M. Batbie thinks, who would be able to work the co-operative system as applied to production, though all might work it as applied to consumption; if, therefore, co-operative production were extensively tried, it would, through defects in management and diversity of temper, zeal, and industry, end in the exclusion or withdrawal of all but the best educated and most intelligent—the remainder falling back once more into the condition of hirelings, in which, being now deprived of the guidance of their natural leaders, their condition would be worse and more hopeless than ever.

It is, of course, impossible to tell whether workmen generally desire co-operation as a substitute for wages or not. What is certain is that they are dissatisfied with their present relations to capital, and that these relations cannot last much longer without great modification, and co-operation certainly commends itself *à priori* as the best change; in fact, it is the only change anybody has yet thought of. Its enemies, M. Batbie included, so far as we know anything of their utterances, have nothing better to offer as a remedy for the acknowledged evils in the condition of labor than recommendations to masters and workmen to be more reasonable and considerate in their dealings with each other. But the world has ceased to expect any great improvements in the condition of mankind from moral maxims. If they were as efficacious as some people evidently think them, the Chinese Empire would be an earthly paradise. Whether the mass of working-men in any country have yet sufficient intelligence or education or self-restraint to work the co-operative system may be open to doubt. Considering the use a great many of them make of their spare money and spare time, and the notions they have of the rights of their neighbors, doubts about it are pardonable. But some are capable of co-operating, and we may be sure that no such movement can possibly be a complete success at once. Even if only a few associations succeed, the sight of their working will exercise an educating influence on the hirelings, and every year a greater and greater number of the latter would be able and willing to change their condition for that of co-operators. There is no danger of the experiment being tried by the whole body of working-men, and of its failing and throwing back the majority into their old position, with hopes blighted and ambition and energy deadened. No great step forward is ever taken at once by all. The more capable and best trained take it first, and show the others how to follow; and we do not ourselves look forward to the co-operative movement becoming general for some years, and its growth, we are sure, will be very gradual. But the number of those capable of taking part in it will every year increase, and the discredit of being left outside of it, and of not having

the qualities—the intelligence, sobriety, and self-restraint—necessary for taking part in it, will every year increase also.

The illustration in support of his position drawn by M. Batbie from the anxiety of the métayers to have fixed wages, in order to save money and buy land, is in every way fallacious—so fallacious that we do not well see how a writer of M. Batbie's acuteness came to use it. The métayer is in the position the artisan would be in if he were paid by a share in the profits instead of by fixed wages. He is not, however, in the position of the member of a co-operative association. If he were one of the joint owners of a farm, and deliberately preferred abandoning his co-proprietorship for the purpose of becoming a hired laborer, then his case would serve M. Batbie's purpose. But he is not; he is a hired laborer, paid in a peculiar kind of way—a vastly superior way, to our mind, to weekly wages—but his position wants the certainty and independence which belong to the ownership of both land and labor or capital and labor. His anxiety to become proprietor of a piece of land himself is, therefore, easy to understand. We are inclined to believe that the working-men in manufacturing industry will, and perhaps would do well to, pass through a stage corresponding to the métayer system in agriculture, in which their wages will in part, at least, consist of a share in the profits; but this assuredly will not be their final goal.

M. Batbie's last objection is that the working-men will never submit to the sacrifice of individuality involved in co-operation—the complete absorption of the man in the mass, and the constant surveillance on the part of his fellows to which each will have to submit, when all are joint proprietors, and all have a fixed interest in the amount of production.

He mentions in support of this that the children of co-operators hardly ever want to take their fathers' places, but he gives no figures or dates or circumstances to enable us to estimate the weight of this illustration. It is not difficult to understand the discomfort which the great mass of men, bred in the atmosphere of deceit, subterfuge, and shirking by which factories and workshops are pervaded under the wages system, must feel on finding themselves surrounded at their work, not, as now, by accomplices in or connivers at every contrivance which promises to enable them to evade responsibility or defraud the employer, but by persons who all have an employer's feelings, or have an employer's interest in exacting a rigid performance of duty. But that nearly every workman will find infinite moral benefit from the change, there can be no question. What the laboring classes need to have developed in them most of all is not the sense of individual independence, but of social obligations—the conception of what they owe to society at large and to their fellows; and there is little doubt that nothing would do this more effectually than the daily presentation to them of their duty—not by "tyrannical capitalists," but by their own fellows—as a thing not to be shirked, or evaded, or slurred over, but to be done faithfully, and not done for the benefit of their precious persons only, but for the benefit of all their mates. The vice of working-men, until very recently, has been brutal individuality, and the tendency of our time is altogether in the direction of excessive segregation, not of aggregation.

There is certainly, too, no reason why the exactingness of the workshop should in any way affect men's lives outside of it, or why the workman who passes eight or ten hours a day under its bracing moral influence should not, in his own home, indulge in the widest diversity of task or pursuit just as he does now.

ANONYMOUS JOURNALISM.

For a long while after the newspaper press had assumed its present shape, it was the fashion to ascribe all its faults to its anonymousness. If it was reckless or abusive, or inaccurate or unscrupulous, or slanderous or slipshod, the reason was, we were generally told, that the writers of articles did not put their names to them. Were they forced to do so, we were assured, they would express themselves with more care, would make sure of their facts before expressing themselves at all, would display more respect for the feelings and reputation of individuals, and infuse a higher tone into their comments upon everything. This way of looking at the matter prevails widely to this hour, and particularly amongst men in public life, who are constantly exposed to the criticisms of the press, and who naturally feel that, in contending with a nameless man, they lose the advantage to which they consider themselves fairly entitled, of a personal comparison between themselves and their critic. As regards the security of private character particularly, it is assumed, almost without discussion, that it would be greatly promoted by forcing writers to appear under their own signatures. Neither well-known men nor obscure men would venture, it is very generally believed, to take the liberties with individual character which both have no hesitation in taking anonymously, if they had to raise their vizors every time they addressed the public.

The question was one of those which could hardly be decided by mere argument. The convenience of anonymousness was so great that the press was not at all likely to abandon it of its own accord, and in America and England—the two countries in which the press was most of a power—there was no means of forcing it to do so. The world is therefore under some obligations to the Emperor Napoleon for having undertaken to try the experiment when he ascended the throne in 1852. One of his first acts was to force every writer of every article in a newspaper, or other periodical or publication, to sign his name to it. The ostensible object of this move was, of course, to make it easy for the police to reach the real delinquents in cases of violation of the law, and thus far it had undoubtedly met with a good deal of sympathy from the general public; but his enemies insist that his real object was to degrade and weaken the press, to drive the best men away from it. To those who had never carefully considered the matter, and who had been accustomed to regard anonymousness as the great vice of newspapers, of course this charge looked like a calumny; but events have proved that, however those who made it may have been mistaken about the design of the Emperor's policy, they were not in the least mistaken as to its result.

What this result has been, readers of the French newspapers know. Under the new *régime* the great newspapers which, whatever their faults may have been—and they were many—were for twenty years the glory of France—in the columns of which some of the ablest French writers first used their pens for the instruction of their countrymen, and in which great questions of politics, of finance, of history, and of literature were discussed with unequalled force, eloquence, and learning, and which exercised during the period between the downfall of the Bonaparte dynasty and its restoration an influence on French opinion such as nothing else ever did—have totally disappeared. As mere newspapers, the French press was always defective; as an instrument for working on the national mind, it has never been surpassed, if ever equalled, by the press of any other country. To be sure, it was not wholly anonymous. It is much less anonymous, for instance, than the English press, but it was sufficiently anonymous to enable any man who had convictions, and wanted to lay them before the world without dragging his own personality into the arena, to do so with the certainty of a fair hearing. A greater change than has come over it in the last fifteen years it would be difficult to imagine. The great writers—the men who cannot bear to speak only half their thoughts, or to speak at all with a police agent at their elbow—have abandoned the field. This, it is true, it would be unfair to ascribe wholly to the loss of anonymousness, as it may be accounted for by the nature of the political *régime* under which they were living; but nothing but the loss of anonymousness will account for the appearance of the breed who have come up in their stead, and for the relations in which even the better class of writers now stand to the public.

One of the most marked characteristics of the new system is the increase of personalities in the press, and personalities of the grossest and most offensive kind—the very thing which the signing of names was expected to render impossible. In fact, a class of papers, known as "la petite presse," has sprung up, which contains nothing but personal gossip, often of the most disgraceful description, in which club and saloon scandal is retailed with as much embellishment and distortion as may seem desirable, and in which, when real scandal is wanting, the writers publish inventions of their own, and, in doing so, respect neither age nor sex. This class of journals is conducted by men who abound in Paris, as in all large cities, and whose number is every day increasing—men without character, or education, or brains, or position, and whose whole stock-in-trade consists in facility in collecting "personal items" and putting them into "lively," slangy language, and in case-hardened indifference to the annoyance they may cause. Their one craving is notoriety, and in this way only, in default of the commission of remarkable crimes, can they attain it. In France, it is the fashion to punish offences against individual character, or privacy, by duel, but this is exactly what the writers of the "petite presse" like. Nothing delights them more than to sting a man of eminence into taking notice of their attacks on him and challenging them, for nothing else

would bring them into so much notice; and they are generally blest with a Frenchman's indifference to the pistol and dexterity with the small-sword.

Nor is this sort of indecency confined to the "petite presse." Men of the same stamp as most of its contributors of course often find their way into the columns of the higher papers, and there indulge their propensities in the same manner and with a similar result. An "affaire" with a well-known man, if they can only bring it about, makes them the talk of the town for several days, and makes their names more or less familiar to the public for long afterwards. Moreover, discussions between two journals on any topic, if the articles are signed, are almost sure to degenerate before long into personalities, and the result has been the shocking crop of duels by which the French literary world has of late been disgraced. The effect of the sight of an opponent, *in propria persona*, in rousing animal pugnacity and turning attention away from the real points at issue, is well known, and is recognized markedly in codes of parliamentary procedure. The rule which obliges all speakers in debate to address the chair, to speak of all other members by their official name, not by their own name, as "the gentleman from New York," "the honorable member for Birmingham," is simply an attempt to throw a semi-transparent veil of anonymousness over the parties to the controversy and thus avoid the notoriously irritating and bellicose influence on the imagination of the "you" or the "John Smith." In like manner, an unpersonal attack on a man by *The Times* or *Tribune* produces a very different effect on his mind from an attack signed "H. G." or "H. J. R." It may mortify or annoy him, but somehow or other it does not produce on him that burning desire to get at somebody and chastise him which is produced by an onslaught made by somebody whose face and figure appear between the lines and shoot out into full relief in the signature at the close. We have had in the press of this city abundant illustrations of what we are here saying. When any of its great warriors want to "handle somebody without gloves," they almost invariably lay aside the editorial robes and make their appearance in the simple character of indignant and outraged men. The long war between "H. G." and "T. W.," for instance, would have been a very colorless and tame affair if it had been carried on simply by *The Tribune* and *Commercial Advertiser*.

It is not only the relations of the writers of the press to each other which are affected by the use of their own signatures, but their relations to the public. The disuse of the anonymous, instead of rendering them and the editors of the papers for which they write more careful, has actually rendered them more reckless. Signing an article, in the first place, by limiting responsibility to the writer only, renders the other persons connected with the journal indifferent to what he says, and it renders him, if a vain or hot-headed man, more reckless and vituperative. His very appearance in person, while rousing the animosity of his opponents, rouses also his own animal courage and stimulates his love of notoriety, and fixes his thoughts more on the figure he will cut in the row which is to follow than on the truth or logic of his statements. The result is that men whom the French journalists criticise are apt to rank their criticisms as personal affronts, and the attempts made in Paris of late to bring these quarrels to a crisis have been a positive disgrace to civilization—all the greater disgrace as they have occurred in the most polished city in the world. The annals of the Natchez or Vicksburg press can, we venture to say, furnish nothing to equal in disgusting barbarism the spectacle which was witnessed on the Boulevards three weeks ago, of the son of one editor—a senator to boot—following another editor of a leading paper along the street, spitting in his face, and loading him with low abuse, and then publishing a full account of the blackguard performance in his father's paper; or that other, in which the two sons of the Minister of Public Instruction (!) had a bout of fisticuffs with the editor of a paper in his own office, in revenge for certain comments on their father's official conduct.

The anonymous has never been maintained in this country with as much rigidity as it has in England, owing mainly to the different constitution of society. The editors of the great papers are generally well-known public characters, although the authors of most of the articles for which they are legally responsible are unknown. But we think our readers will agree with us when we say that the tone of the press has suffered more from the personal prominence of its conductors than from any other cause. Whenever its columns are disgraced by vituperation, it is nearly always in some quarrel of the editor with which the paper as a paper has not and need not have any concern, and in which the public in most cases takes no sort of interest; and we think it will be found, on a careful examination, that all those papers which owe much of their position to the editor's personal reputation are apt to rely too much upon it, and admit matter to their columns which, if they had to stand on their own merits, they would not dare to publish.

Nor is this the only way in which the partial disuse of the anonymous affects literature and society unfavorably. It has originated, and is bringing into greater and greater vogue, the purchase of the names of distinguished writers as a means of passing off inferior wares on the public. As soon as a man has acquired a reputation nowadays which creates in the popular mind a presumption in favor of the productions of his pen, he is beset by the publishers of struggling or sensational periodicals with offers of large sums, not for good articles, but for any kind of articles with his name to them; the name being what is most wanted, everything else being of comparatively little moment. It is not in human nature for men, writing under the consciousness of this fact, to write well, even if they tried to do so; but, in most cases, they do not even try. They know that anything they write will be read, and that, whether they write or not, they are sure of their money and their employers sure of their profits; so they "strike off" in their leisure hours yards of maudlin sentimentality, milk-and-water philosophy, slip-slop politics, and trivial schoolboy reminiscences on all sorts of themes, which debauch the public taste, cheat the more ignorant and simple readers, and, what is worse than all, spread and develop amongst young men that fatal indifference to excellence, thoroughness, finish, and depth which is one of the curses of our time. When students leaving college read the bosh which doctors of divinity, "able editors," and "distinguished statesmen" print in popular periodicals, with their names and titles unblushingly written over it, we can hardly wonder if they do not place their own standard very high, and if the "sensational" branch of our literature be that whose growth most nearly keeps pace with the material development of the country. There is a want of conscience in this name-selling which calls for the reprobation of everybody whose reprobation has any influence. The public does not need to know what kind of matter the Reverend Dr. Chrysostom or the Honorable Jeremiah Boanerges can turn out once a week for ten thousand dollars a year; but it does need to have all the results of careful culture and sound and conscientious thinking which its ablest minds can furnish laid before it as often and as regularly as the resources of the press will permit.

The world will, doubtless, one day reach a stage of culture in which writers, no matter what their degree or antecedents may be, will be able to publish their opinions to the world in the press with the certainty that these opinions will be considered on their merits, and without any reference to the personal character of the utterers of them; but we are evidently far from that stage as yet. How very far we are, and how needful the anonymous still is, was illustrated curiously in the last number of the *North American Review*, in a critique on Mr. Edward Atkinson's pamphlet on the *Collection of Revenue*. The critical notices of *The Review* are generally its very best feature, and are not surpassed by those of any similar periodical in existence—a circumstance which renders this illustration we are about to draw from them all the more valuable. The writer of the notice was desirous of combating Mr. Atkinson's, as well as Dr. Walker's and Prof. Perry's, free-trade views, so finding the logical handling of their processes inconvenient or troublesome, he disposed of them, no doubt unconsciously, by what may be called the "biographical method," which is certainly novel in its application to scientific questions. Professor Perry he despatched by showing that being merely a scholar (the whole science has been built up by mere scholars), and not having any practical experience of "business," he was forced to get his political economy out of English books; Dr. Walker, by showing that, having passed his early life in the shoe trade, he got jealous of the cotton men and became a free-trader out of envy; Mr. Atkinson, by showing that, though bred a Webster Whig, on finding that he and the cotton manufacturers generally had feathered their nests under the tariff, he was now ready to throw it overboard. Had Mr. Atkinson not put his name to the pamphlet, it would, doubtless, have been discussed on its merits, though doubtless it would not have attracted so much attention.

PARIS GOSSIP.

PARIS, July 17, 1867.

GOSSIP has, of course, been busy with the Sultan during his stay here. We are assured that he never takes wine, and performs frequent ablutions, uses no other water than that of the Nile, cargoes of which have been brought over from Alexandria and emptied into the largest of the fountains of the Elysée Gardens, cleared out for their reception; that he always eats alone and hidden from the eyes of servants by a screen; that he is greatly enjoying his stay here, and is vastly impressed with the splendor, greatness, and glory of France, her capital, her sovereign, and her people. The fact which seems to have made most impression on his mind in connection with the latter is the superior style in which they are all shod;

whereas, in Turkey, the mass of the inhabitants wear nothing but wretched, worn-out slippers, affording no proper protection to the feet. The Sultan is an intelligent, thoughtful, and fairly-educated man, having had the advantage of European teachers. He has disappointed the Parisians by the simplicity of his appearance and doings, and the modesty of his purchases. It was expected that he would be tempted into laying out millions among the shopkeepers of the capital; but no such outlays have been ascertained to have been made by him beyond the small amount of seven hundred francs. It is, however, observed in his favor, that he seems to appreciate the charms of the French stage, and is fond of music. Among the anecdotes recalled by his presence here is one which tells how the well-known pianist, Leopold De Meyer, when visiting Constantinople in the days of the late Sultan, Abdul Medjid, was sent for by the latter, when, on being conducted into the sublime presence of the Commander of the Faithful, he found that the piano sent by him to the palace for the occasion had been deprived of its legs and placed on the backs of five slaves, who were supporting themselves under the heavy weight as best they could on their hands and knees. This singular proceeding, the pianist was informed, had been adopted in order that the magnificent mosaic floor of the gallery might not incur any risk of injury from the casters of the legs. The pianist, dismayed at the sight, pointed out to the Turkish equivalent of a master of the ceremonies that he could not perform on a piano whose keyboard was not level, and pointed to one of the corners which, as the servant supporting it was much smaller than his fellows, was considerably lower than the others, whereupon the official caused a cushion to be placed under the servant's knees, thereby restoring the equilibrium of the instrument. But the artist still protesting his utter inability to perform on a piano thus unsteadily supported, the legs were at length screwed into their places. The artist next demanded a chair, but was informed that it was contrary to etiquette for any one to sit in the Sultan's presence. At last De Meyer succeeded in convincing the official that he could not play standing, and the difficulty having been referred to his Majesty, the artist was finally provided with a seat, and proceeded to show off his powers, to the great satisfaction of his imperial auditor, who complimented him highly on his skill, and made him a handsome present. When Felicien David was in Constantinople, Abdul Medjid had him sent for to give singing lessons to the ladies of the imperial harem. But the composer's romantic visions of intercourse with those mysterious beauties were sadly dashed by finding, on his first admission to the palace, that he was not to be allowed to enter the presence of his illustrious pupils, but was expected to transmit his teachings to them through the chief of the eunuchs—a discovery which of course put an end at once to his visions and his engagement. The friends of one who is equally estimable as an artist and as a man will be glad to know that the prize of twenty thousand francs—to be given by the Imperial Academy of Music to the composer who, during the last twenty years, has done most for the lasting honor of the French school—has been unanimously awarded to the author of "Herculaneum" and "The Pearl of Brazil."

The theatrical world of Paris has been thrown into a ferment by the revival, after an interlude of twenty years, of Victor Hugo's "Hernani," and of Sardou's "Famille Benoiton" after a lapse of two. The friends and enemies of the gifted poet, who persists in remaining a voluntary exile, had fought their old battles over again, with almost the old ferocity, from the moment when it became known that the Théâtre Français was preparing to bring out "Hernani," until the night of its appearance, when the house was crammed from floor to ceiling, and the piece was received with the most enthusiastic demonstrations, every line being listened for with the utmost eagerness by an audience which evidently had the entire play by heart. At the occurrence of the line "Maximilian is dead!" a sudden shudder seemed to pass through the assembly; every one involuntarily thought of the brave Austrian prince struggling against adverse fortune beyond the seas, and something like a presentiment of the tragedy, of which we had then received no tidings, seized on the minds of all present. Unable to resist the temptation to drink in, with his own ears, the plaudits so especially dear to French vanity, the poet, notwithstanding his hatred of the Emperor, came *incog.* to this city, and assisted at one of the early performances of his play.

As for Sardou's portraiture of a "Fast Family," which was considered, when it first appeared, as a witty, but somewhat calumnious exaggeration of the social tendencies of the day, the world of Paris has been moving so rapidly forward on the path depicted by the author, that the play seemed almost tame in comparison with the facts about us. The "loud" toilettes, the slang, the bold opinions and independent doings of the Benoitons are actually distanced by their rivals and imitators of to-day; and all the quietoing portion of the public, seeing the enormities of dress and behavior now so largely patronized by those who might be expected to set a better example, hold up their hands in horror and wonder "what next?"

Mr. Sothern, in "Our American Cousin," is also decidedly successful. For a fortnight past every inch of wall or boarding not already occupied by the flaunting advertisements of "The Great American Circus"—showing men and beasts in the most impossible attitudes, adorned with all the colors of the rainbow—has been filled with large portraits of his eccentric lordship gravely counting on his fingers, eyeglass on nose. The English and Americans here, and the comparatively limited portion of the French public which is able to comprehend the humor of "Lord Dundreary," are flocking, night after night, to the Italian Opera-house, and heartily enjoying an impersonation absolutely unrivalled in its way. The American colony was to have had a celebration of the Fourth of July in the beautiful public gardens of the Pré Catalan—the scene of the brilliant and successful festival of last summer—but the project having been abandoned in consequence of the painful news from Mexico, the celebration of that anniversary was limited to a dinner, of about two hundred and fifty persons, at the Grand Hotel, and the subsequent handing over, by its managers, of the surplus fund raised for the dinner—about a thousand francs—for the benefit of the American church in this city.

The propensity of Frenchmen to decide the pettiest quarrels by a duel has led to the absurd and scandalous spectacle of a senator, angered by remarks made in a speech by another senator, sending to that colleague an angry demand for a "meeting," and getting publicly snubbed for his folly. It seems that certain reactionary inhabitants of St. Etienne, having recently discovered in the Public Working-Men's Library of that town a copy of Renan's "Life of Jesus," and one or two other works not in harmony with the fashionable dogmas of the day, sent a petition to the Senate praying for the removal of the obnoxious books. A member of the Senate, M. Lacaze, one of those obscure members whom accident occasionally brings to light in all such bodies, conceiving himself to be "insulted" by the eloquent speech made by another of its members, M. Sainte-Beuve (the well-known literary critic of the *Débats*), wrote to that gentleman requesting him to send two "friends" to arrange a meeting. M. Sainte-Beuve replied that he really knew nothing of arms, and must go through a course of training before he could meet M. Lacaze on the ground indicated. Lacaze, more angry than ever, sent a second and more violent letter, to which Sainte-Beuve replied by an epistle wise as witty, and witty as wise, showing the indecency and absurdity of attempting to settle moral questions by physical violence, and completed the pulverization of his adversary by publishing the entire correspondence. As duelling is forbidden by law, and punishable with penalties varying according to the circumstances of the offence, the affair has made no little hubbub, especially as the speech of M. Sainte-Beuve has been the innocent occasion of bringing the students of the Normal School to grief.

The students in question, all of them young men of special promise, and destined to the career of professors and teachers, are in the habit, every year, on the approach of the summer vacation, of getting up a lottery, a sale, a theatrical entertainment, or similar affair, in aid of some charitable object, and generally address themselves for help, on these occasions, to former pupils of the school. It so happens that these youths had just applied to M. Sainte Beuve, an old pupil of the school, for help toward a sale which they were organizing in aid of some charity, and had received from that brilliant writer a complete copy of his works. His bold and telling discourse in vindication of the rights of conscience and of literary freedom adding to the grateful enthusiasm excited by his handsome gift, one of the young men indited a somewhat high-flown letter of thanks to Sainte-Beuve, expressing the admiration with which the school had read the discourse in the Senate. This letter was signed by nearly all the students, and sent to M. Sainte-Beuve. Unluckily, one of the heads of this important institution, M. Etienne Arago, an intimate friend of the senator, getting sight of a copy of the letter, was so much charmed with the sentiments expressed in it that he forthwith published it in one of the papers of this city. As the law forbids all expression of political opinion by the students in the public schools, the youths who had been most active in getting up the letter to Sainte-Beuve were hauled over the coals and threatened with expulsion, on which the entire school proclaimed its sympathy with the incriminated students, declared that they considered the letter to be theirs, and demanded to share the fate of their comrades. M. Arago has taken on himself the entire responsibility of the publication of the letter, and has shown that the pupils had no intention of publishing it. But the university authorities are very angry; they ignore M. Arago's assumption of responsibility, and have brought the letter of the law to bear on the institution. The students have been dismissed *en masse*, and the school is closed until the middle of October, when it is to be re-opened with a new set of students.

As the pupils of the Normal School are mostly poor as well as exceptionally clever, the decision of the university is generally regretted. The greater number of these youths have pursued their studies at the price of heavy pecuniary sacrifices on the part of their friends, and have worked exceedingly hard, taking the highest honors in the course of their career; and it is hoped that a measure which destroys the hopes of so many families, and deprives the country of so valuable a body of trained instructors, will be rescinded, and the school reopened to the pupils who have just been driven from it.

Fine Arts.

THE YALE COLLEGE ART BUILDING AND EXHIBITION.

New Haven owes to Yale College, and Yale College to the late Augustus Russell Street, the best picture-galleries in the land. They are but recently finished. The building of which they form the most important part is not yet finished. They are now put to use for the first time. A few pictures belonging to the college occupy a part of one gallery, and the rest of the wall-space is occupied by a loan collection of rather higher average merit than is usual even in New York.

The building, which, for some reason, does not bear Mr. Street's name as a distinguishing title, but is called simply "The Yale School for the Fine Arts," occupies a good site at one corner of the College Green. It is very irregular in plan, and has a square tower and corner turrets. For some hidden reason these turrets have no caps or roofs of any kind, and the tower lacks its whole uppermost story and its high roof. The drawings and photographs of the drawings show a finished tower—which, as a central and ruling feature, the irregular building needs imperatively—and high pyramidal caps to the turrets. The expense of completing the building would not be great, and, as we have said, the reasons for leaving it as it is are unknown to us at least.

The architectural merit of the exterior is very much greater than that of any other building connected with the college. This is not high praise, for the old dormitories and lecture-room buildings are without any claim to be considered works of architecture at all, the Library is of a very insincere and made-up design, and the Alumni Hall is in every way execrable. Yale College has buildings no worse than those of Harvard or of other great American colleges, but also no better. The Art Building, then, as being not only excellently well built, but also rationally and intelligently designed, with an exterior in many ways truly expressive of the purpose and of the interior arrangement of the building, and with a little good ornamental detail, is a great thing for Yale College and for New Haven to possess. It is probable that future buildings of college and town will be better built and more carefully designed than before, and, if so, the new worth and interest of the city will date from the Street Art Building as from a sort of Hegira, or, rather, an Avatar.

This building does not compare in exterior beauty with the New York Academy of Design, also a work of Mr. Wight's, and the one by which he is best known. That building remains, with whatever faults or shortcomings, the most beautiful work of architectural art in America, and would gain an added beauty if all the sculpture were finished as intended, and the great mosaic set over the main door. The Yale building does not aim at any such richness and abundance of decoration; it is a plain brown-stone building, with no beauty of color and with almost no sculptured ornament. But, also, it has not that beauty of outline and of mass which the world had a right to expect from the architect of the Academy of Design. It is not a successful composition; it lacks concentration and unity; its many parts are not harmonized; it lacks all that would make it a *good design*.

But its galleries—two large ones lighted by skylights, with a corridor between lighted with north-windows, and a staircase-hall connecting with all three—are both better lighted and handsomer than the galleries of the New York building, and are, therefore, the best in the country. They are particularly effective by gas-light; and although the exhibition of pictures by the yellow glare of gas is wholly unwise and very unjust to the unfortunate artists, yet, inasmuch as evening "receptions" and evening exhibitions are always of the nature of social gatherings, with some pictures hanging by to afford subjects of conversation, so it is well to have pretty and brilliant rooms in which to hold these not wholly useless gatherings.

One such reception was held when the exhibition was first opened three weeks ago. Another was held on the evening of Yale Commencement Day, July the 18th. On that evening the pictures had been partly rearranged, and some had been added, and the exhibition had put on a somewhat permanent and finished look, as if settled for the summer. The rooms were full, the company in good humor, the evening not insufferably hot, and the music by the New York Philharmonic Society's band was delightful—excellent and most appropriate selections excellently performed. For the rest of the summer the exhibition will be open by daylight, with "receptions" on Wednesday evenings.

In the north gallery are some thirty pictures of the Trumbull collection. The others still remain in the little building so long known as the "Trumbull Gallery," but it is probable that all will soon be removed from that humble house, and the building itself torn down. Of these pictures we say nothing at present. Colonel Trumbull was, as the art-critic of *The Tribune* called him once, a good enough Connecticut Giotto to start with, and his pictures are worthy of a certain respect and attention, though, perhaps, there are too many of them—certainly too many square feet in the aggregate. So in the south gallery is the huge "Jeremiah" of Washington Allston, one of his least valuable pictures; and although every work of that painter has some marks of his power, as nearly a worthless picture as any not confessedly a sign or an advertisement. In the same room is a marble statue of "Ruth," a very feeble and false work of sculpture. Both this and the "Jeremiah" are recent gifts to the college.

The loan collection has this peculiarity, that there have been pains taken to get together the works of two artists, Mr. Farrer and Mr. Moore, and to hang them, with some works by followers and pupils of theirs, in one group. So far as this arrangement is concerned, of all the obtainable works of a certain artist in immediate juxtaposition, we have only commendation to offer. It is always right to hang a man's pictures all together. Whenever the time shall come that exhibitions of pictures are made for the sake of people who love pictures, and arranged by people who know pictures, then all the works of each artist will be shown and catalogued in sequence. In these galleries, if one should wish to study Kensett he must hunt for the three pictures by that gentleman, and it will be wholly by chance or else as the reward of patient toil if he find them all three. Then, if No. 165, "Almy Pond," please him as much as it ought to, and if he wants to compare its good points with the large picture, No. 102, he must walk a good way to get before it. Now, in this small collection there are only two or three pictures by any one man, except by the two painters above-named as having their pictures rightly together, and therefore it seems less strikingly necessary. But when, as often in our New York Spring Exhibitions, a painter sends six or eight new pictures, all of a certain importance, it becomes very needful for the proper study of each man's and of the whole year's achievement that the works of one author should be put together as the works of one author generally are in a library.

A large part of this collection is from New York, and fresh from the Spring Exhibition, which had just closed when this one opened. Thus Mr. Huntington's large landscape, "Chocorua Peak," a cold gray and brown lifeless abstraction of mountains and lake; Mr. Kensett's much pleasanter and more nearly truthful landscape; Mr. Nichols's hopelessly gloomy and inartistic "Osceola;" Mr. Gifford's deservedly popular "Sunrise on the Sea-shore;" Mr. Moore's glowing and fine though faultful "October Snow Squalls;" Mr. Johnson's noble picture, "The Pension Claim Agent;" Mr. Gray's trivial and meaningless "Geneviève;" Mr. Farrer's real success, the "Summer Flowers," and others that might be named, were among the noticeable and the noticed pictures in the Academy of Design galleries from April until July. Then there are some old acquaintances with which we renew acquaintance; as, for instance, Mr. Bierstadt's "Sunshine and Shadow," which is much more interesting and comes nearer to good art than his recent larger and more pretentious works; Mr. Neal's "Interior of St. Mark's," an approximate rendering of an architecture perhaps the most difficult in the world to render rightly—and therefore a picture of value; Mr. Lang's sentimental "Inheritance;" Mr. Church's "Morning in the Tropics," a picture in his hardest, most lifeless, most spotty and agonized manner; and the numerous pictures of former years by Mr. Moore, Mr. Farrer, Mr. Newman, and Mr. Pattison, of which, as we have said, a special gathering has been made.

This New Haven collection is fortunate in having, what New York collections seldom have, a fine drawing by J. W. Hill, and another by J. Henry Hill. Works of both these masters of water-color find their way into the Artists' Fund and other loan exhibitions in New York; but, as neither father nor son ever willingly exhibits his pictures, it is but seldom that a new drawing, and one adequately representing the artist's power at the time, is to be seen in public. The splendid drawing of fruit, No. 197, seems to us the finest work of the kind that has been produced by any American artist. It has a share of that strange beauty that invests the plums and pine-apples of William Hunt, a beauty that seems half a new discovered

charm in the fruit itself, half a delight in the mere expression of beautiful fancies of color. The moderation of this work, the noble quietness of it, the absence of any attempt to get projection and "force" at the expense of color and delicacy, the charm of the suggested detail of its background, are all parts of its excellence. It is within its necessary limitations a thoroughly great drawing.

"The Falls of the Hudson," No. 189, by Mr. J. Henry Hill, takes a higher flight, and with almost entire success attempts a most exalted and difficult landscape subject. There are great qualities in this man's work which other landscape painters do not show. What is that peculiar power which makes his best drawings as vivid and intense as sketches and yet elaborately finished and realized work? Of course this can only be said of his best work, but it is true of this drawing at New Haven. In one of the wonderful woodcuts of that great Japanese realist Oksai, is a mountain stream much like this one, without the glorious scarped rock crowned by trees, but as spirited and headlong a fall. It is a great thing that this picture, which gives color and shadows and partially perfected details, should still keep the simple energy and truth of line which one generally expects to see in sketches only.

Among Mr. Farrer's pictures we are glad to see again the picture of 1862, "Hudson River at Catskill," No. 144. It is, in our opinion, his best landscape in this exhibition, because it is the truest to the beauty of nature, because it has shortcomings only to mar it, and those the bearable shortcomings of truth not carried far enough, and beauty felt but not perfectly reproduced. It is a picture of value. No. 145, "Mount Washington," with the foreground of smooth pebbles heaped in the river-bed, is probably the second in value. It has strength and knowledge in it which the former has not; the mountain and sky are unmistakable. Let any one go from these pictures to one painted five years and one four years ago, to the "Street Scene in Northampton" by moonlight, of a recent time, and the just completed "Fawn's Leap," and he will probably wonder, as we do, what influences can be at work to cause such a change and such a breaking of promise to the hope. "The Fawn's Leap" is especially unfortunate; as mistaken a landscape as Mr. Farrer has ever painted, and as bad a painting of a waterfall and rocks as Mr. Hill's is completely good. Of the foreground studies, which are Mr. Farrer's greatest triumph, there are several here, the capital "Summer Flowers," from the New York Spring Exhibition, "May" and "June," studies respectively of dandelions and columbines, another and a better picture of dandelions, a capital study of "Clematis," none of them, indeed, excelling the picture of "Trailing Arbutus," which has never been exhibited except at Goupil's gallery, but reminding the spectator pleasantly of it and its congeners.

Mr. Moore's pictures at this gallery show us his course of study and his advance for the past three or four years. They have all been noticed at length in The Nation except "Pansies," 155, and "Study of an Orange," 156. The picture, No. 159, "Apples," three great ones on a Japanese tray, seems to us to contain the most perfect instance yet given of Mr. Moore's way of work.

PARKMAN'S JESUITS.

OPINIONS OF THE PRESS.

"To other most important qualifications for his task, Mr. Parkman joins a simple, forcible, pleasing style of composition, and uncommon skill in the grouping of the incidents which he has to relate."—*New Englander.*

"A work we can commend as one more absorbing than a romance, and equalled by few histories in graphic clearness and power of commanding the reader's sympathy and confidence."—*Round Table, N. Y.*

"The result of these painstaking efforts is shown in the production of a work which is likely to remain a standard authority. . . . The reader once beginning this narrative will read to the end. The picture is strikingly painted, and the interest always sustained."—*N. Y. Evening Post.*

"By this admirable volume the author has made all American readers more than ever his debtors."—*Philadelphia Inquirer.*

"A picture of the past, fairly rivalling the histories of Prescott, both in originality of research and admirable simplicity and purity of style. It has a charm of personal narrative about it such as few works of the kind possess."—*Philadelphia Ledger.*

"As we are borne along with the rapid movement of a narrative which kindles the blood, and fills the imagination as well as informs the understanding, we forget with what toil the materials for so consecutive a story must have been collected and arranged; but the research implied in every glowing chapter of Mr. Parkman's volume would alone have been sufficient to give him a deserved reputation."—*Boston Transcript.*

"Mr. Parkman's descriptions of Indian life are unsurpassed by anything of the kind. Few subjects are more attractive than the one upon which he is laboring, and, for the success with which he has thus far treated it, he deserves to be ranked with Prescott and Motley."—*Boston Advertiser.*

"M. Parkman possède un style pur et plein de charme; il narre avec chaleur, et trace les caractères de main de maître. En bien des endroits il rappelle l'écrivain américain Prescott."—*Journal de Quebec.*

A NEW VOLUME BY LOUISA MUHLBACH.

D. APPLETON & CO.,

443 AND 445 BROADWAY, NEW YORK,

WILL PUBLISH ON THE 10TH OF AUGUST,

Marie Antoinette and Her Son.

AN HISTORICAL NOVEL.

BY L. MUHLBACH.

1 volume 8vo, containing eight illustrations. Paper covers, $1 50; cloth, $2.

This novel—the latest production of Miss Mulhbach's pen—describes the most thrilling epoch in the history of France. The romantic career of the beautiful and unfortunate Marie Antoinette, and the Reign of Terror, are depicted with historical accuracy, and in the author's happiest style.

RECENTLY PUBLISHED BY THE SAME AUTHOR,

LOUISA OF PRUSSIA AND HER TIMES. An Historical Novel. By L. Muhlbach. 1 vol. 8vo, illustrated. Paper covers, $1 50; cloth, $2.

HENRY VIII. AND CATHARINE PARR. An Historical Novel. By L. Muhlbach. 1 vol. 12mo. Cloth, $2.

JOSEPH II. AND HIS COURT. An Historical Novel. Translated from the German by Adelaide de V. Chaudron. 1 vol. 8vo. Paper, $1 50; cloth, $2.

FREDERICK THE GREAT AND HIS COURT. An Historical Novel. Translated from the German by Mrs. Chapman Coleman and her Daughters. 1 vol. 12mo, 434 pages. Cloth, $2.

THE MERCHANT OF BERLIN. An Historical Novel. Translated from the German by Amory Coffin, M.D. 1 vol. 12mo. Cloth, $2.

BERLIN AND SANS-SOUCI; OR, FREDERICK THE GREAT AND HIS FRIENDS. By L. Muhlbach. 1 vol. 12mo. Cloth, $2.

FREDERICK THE GREAT AND HIS FAMILY. By L. Muhlbach. 1 vol. 8vo, illustrated. Paper, $1 50; cloth, $2.

The Week.

MR. STANTON has at last been suspended, General Grant taking his place *ad interim*. It is reported that the office has been offered to General Steedman, which is very likely; also, that it is to be offered to Governor Andrew, which is very unlikely. The President desires to be rid not simply of Mr. Stanton, but of the set of politicians to which Mr. Stanton belongs—that is, of all persons who side with Congress. The dismissal of Mr. Stanton—coupled with the Dunham revelations—seems to indicate that Mr. Johnson has completely lost his head, and that the advisers who, for the last six months, have been urging him into extreme courses, have at last vanquished his fears or his scruples. The public will now be curious to see the effect of all this on Messrs. Seward, Randall, and McCulloch.

If any justification were needed for the trial of the Lincoln assassins by court-martial, it would be furnished by the proceedings in the Surratt case. The jury, as most people expected, disagreed; but then the line which divided them is worth notice. There were four, it is said, for conviction, of whom two were Northern men, one a Scotchman, and one a German. There were eight for acquittal, all of whom were Southerners except one, and he was a New Yorker. It would not be fair, of course, to draw from these curious facts any inference as to the honesty of the majority of the jurors; but it is fair to draw from it an exceedingly unpleasant inference as to the condition of the Southern mind touching crimes arising out of or in any way connected with the war, and nine out of ten of our readers will draw it. If we were to judge, however, of the moral condition of the District from the judicial proceedings which take place in it, we should conclude that nothing could be worse. We doubt if any white man has been for many years, if ever, convicted in it for murder, particularly if the crime was notorious and excited much public interest. The moral condition of the bar, too, seems to be, if anything, rather worse than that of the public. In most of the great murder trials the counsel on both sides behave rather like "backers" at a prize-fight than professional advocates, and the judge is apt to be a model for a pugilistic "referee." In this last affair the bar seems to have outdone itself. The conduct of the prisoner's counsel throughout it is impossible to characterize without epithets which we do not care to use. In the middle of the trial he threatened to "thrash" the judge when he came down off the bench, and the judge, we presume, out of regard for the prisoner's interests, allowed him to go on till the close of the trial, when he most properly, most righteously, and for the credit, not of justice simply, but of American civilization, struck the attorney's name off the rolls, and was immediately challenged by him. To cap the climax, the bar has been holding a meeting "to enquire into the facts and circumstances of the disagreement between Judge Fisher and Mr. Bradley." A more comical euphemism than "disagreement" we have rarely met with.

Perhaps the funniest episode of the week was the revelations made on Saturday by the Acting Attorney-General, Mr. Binckley, of attempts made on the virtue of Charles A. Dunham, *alias* Sandford Conover, by Messrs. Ashley and Butler, the impeachers. Dunham, it may not be generally known, is one of the most distinguished perjurers of whom history makes any note, and swore right and left before courts-martial during the investigations consequent on Mr. Lincoln's death, in a way which makes Titus Oates seem a very insignificant personage. He was found out, however, convicted, and sentenced to the penitentiary for a practically interminable period. Being naturally desirous, however, of avoiding serving out his sentence, he got up a story that Mr. Ashley and General Butler, of all men in the world, had endeavored to induce him to furnish evidence that Mr. Johnson had been guilty of complicity in Mr. Lincoln's assassination, and for this little service they were to procure his pardon. The proof furnished by Dunham of this extraordinary performance on the part of these gentlemen is, that Mr. Ashley did sign a petition for his (Dunham's) pardon, and that he did write him four short notes, in one of which he says he is going to Philadelphia, and presses Dunham to send him his "statement;" in another, he acknowledges the receipt of the "statement;" in the third he advises Dunham to have his counsel act "as he (the counsel) deems best, taking advantage of every legal point that may be presented;" in the fourth, Mr. Ashley says he has just seen Mrs. Dunham, and he does not believe the "false, stupid reports" against Mr. Dunham, and that if this gentleman would send him "the originals," they should be carefully preserved. So much for the evidence against Mr. Ashley. Of proof against General Butler there is not a scintilla, except the assertion of C. A. Dunham, Esq., himself. One does not need to have a very high opinion of either Mr. Ashley or General Butler to have a hearty laugh over this story, although "the Acting Attorney-General" writes it out with much solemnity, and appends to it moral reflections which we all may read with profit. All we can say is, that for twenty-five dollars and a promise of indemnity three or more gentlemen connected with the administration of criminal justice in this city may be produced to prove on oath offences of the most startling character, not against Ashley and Butler only, but against any of the leading Radicals whom Mr. Johnson may desire to have brought to shame, commencing with their early Sunday-school larcenies, and running on through burglary, forgery, horse-stealing, and murder in the first degree.

General Butler's report on his connection with the exchange of prisoners during the war has not disappointed us in respect to the ability displayed by him in his negotiations, while it has made very clear the successive stages of those negotiations, and the attitude of all parties concerned. The original and lasting root of difficulty was the refusal of the Confederate authorities to ratify the paroles at Vicksburg and Port Hudson. Since the men thus set free had been reabsorbed at once into the Confederate armies, and since an equal exchange between prisoners actually held in custody, and about whom there was no dispute, would have still further recruited the rebel ranks at a critical moment in the final strategy of the war, General Grant, it seems to us,

was fully justified in preventing an exchange which the Confederates were anxious to effect. We fail to see, however, that he thus became responsible for the previous or subsequent barbarities of the Southern prisons, or should bear any part of the public odium in which the authors of so much misery are rightly held. Instead of seeking to make him an accomplice with Wirtz and Winder, General Butler might have explained why he himself entered so officiously into General Grant's views as to fabricate pretexts for not consenting to the unwelcome proposals for an exchange, and even to intrigue for putting an end to them. He might also have been content to point to his successful applications of the *lex talionis*, and to allege that if his earliest plan for wholesale retaliation in the manner of Belle Isle, which for a time was approved by Secretary Stanton, though overruled by General Grant, had been tried, there had been no further torture of Union prisoners. So it is creditable that through him that distressing delivery of some 12,000 sick and dying took place at Savannah and Charleston; that he shared General Grant's determination (if not method) to make the negro soldier when captured respected; and that he yielded his own preferences to those of his superiors. His report embraces a proposition on our part for the mutual support by the belligerents of their own prisoners in the enemy's country, which proves that there is no ground for the defense that the starvation in Southern prisons resulted from a real scarcity of food, and still less for the assertion that the Confederate prisoners at the North were equally maltreated with those at Libby or at Andersonville.

Mr. Benjamin Wade is, we regret to say, figuring in England as an "awful example," having recently been held up to the gaze of the British democracy, by the Earl of Shaftesbury, as a leveller and communist. It was, however, very disingenuous in the earl not to give Mr. Wade's own version of what he said in Kansas, which is that the working classes have not yet derived all the benefit to which they are entitled from labor-saving machines. If this be communism, Lord Shaftesbury may make the most of it.

If we understand the action of the Michigan Convention last Thursday, the liquor prohibition clause embodied by it in the new constitution already exists in the present instrument, and simply forbids the Legislature to license the sale of liquors. An effort was made to direct this body to pass a license law, but it was defeated, as was also a proposition to submit the subject separately to the popular vote. Another, and perhaps as efficient a provision against drinking-saloons, was the clause requiring a public library in every township, and one or more in every city, and making the crimes caused by ignorance contribute to their support. Considering the relation between intelligence and republican self-government, the free library may well be as compulsory as the free school. For neither can we depend on the occasional beneficence of uncommon Peabodys. Had the Eastern States been wiser, they could, with the money thrown away upon district-school libraries —never consulted, often unpacked, and always deficient—have founded a large number of public libraries, which by this time would have grown to respectable and useful dimensions.

The Chicago *Tribune*, commenting on what we said a fortnight ago upon the political value of good intentions, adds to the illustration of their worthlessness which we then cited the case of the whiskey tax. The politicians insisted that two dollars a gallon on it could be collected without difficulty. The "theorists" and "dilettanti" said it could not. The experiment has been tried, and the result is that about one gallon in four has paid the tax, while falsehood, perjury, fraud, and smuggling have been developed by it to an appalling extent. In fact, a more shocking example of the bad effects of the legislation of well-meaning, ignorant men it would be difficult to find in history. But there will be no end to this sort of thing till newspapers stop chanting hallelujahs over every "self-made man" who marches into Congress and boasts of his want of schooling and love of the poor, and stop calling people "grand public men," and "great statesmen," whose attainments, both natural and acquired, are barely equal to the requirements of a senior class in a Sunday-school or of a "young men's" debating club.

The Boston *Post* communicates the intelligence that it was the attempt of "President" Roberts and others to bring the Fenians into the Radical camp which drove General Sweeny, as well as many other valuable men, out of the organization, and which has since disgusted and alienated a great many of the rank and file. Not over a thousand or two are supposed to have voted the Radical ticket, in spite of the blandishments of Messrs. Banks, Chandler, and the New York *Tribune*, and now Roberts's flirtation with "the party of action" in Italy is thoroughly destroying the confidence of the pious Fenians in him. The British Government is, it is said, sending out troops for the protection of Canada against the great August invasion. That this movement will soon come off it would be useless to deny, for have not the Fenian organs announced it? and that it will be abominably bloody there can be no question, for have we not the Irish campaign, and the Canadian campaign of last year before our eyes? but still we think the Canadians would themselves be able to bear the brunt of it. The attendance of one of the Fenian "generals," who "commanded" in the Canadian foray last summer, to superintend the obsequies of Jeremiah O'Brien, an ex-Fenian soldier, who served under him—a rowdy, too, who had lived for years on the wages of a prostitute, and then murdered her in cold blood because she stopped his supplies, and was hanged for the crime—lights up the moral side of the organization in a curious way. We should never recur to this most disgusting chapter in political history if respectable politicians had not tried hard to persuade the moral and religious community of the United States that the Fenian swindle was a praiseworthy and efficacious undertaking.

The English Parliamentary Committee appointed to enquire into the matter of protection against fires have brought in their report. They trace fires to several sources—"gangs" who make a trade of defrauding insurance companies, and who were alleged, in the evidence, to be principally German Jews; persons who have been unfortunate in business and want to raise money; porters who have stolen goods and want to cover up the theft; and lastly, to malice. An elaborate system of enquiry is recommended; but we doubt whether any means of prevention would be so effectual as greater care on the part of insurance companies touching the moral character and pecuniary condition of the persons they ensure. The carelessness of some of the companies here on this point is often astounding.

The "easy divorce" business is being brought every day nearer and nearer perfection in the West. In Cincinnati, the other day, a man got a divorce without his wife's knowledge, upon a simple statement in his petition that she represented herself to be thirty-two years of age at the time of her marriage, when she was in reality over forty, and that she was "a common scold." No papers were ever served upon her, and the necessary legal notice was published in a "Price Current," or other paper of that class which no woman ever sees. Her character, too, was faultless, and she had a child fourteen months old, and the sole apparent motive of the husband was a desire to marry another woman. In this case the attorney, in person, supplied whatever proof was needed to make out the case, and appears to belong to a class of "divorce lawyers" who absolutely live by perjury and fraud. We have not as yet begun to see the effect on society of our present divorce laws, or of the moral condition of the legal profession in some of our large cities; but if something be not speedily done by way of reform, the next generation will both see them and feel them. It may not be expedient to make men live with women they do not like, but no society can with impunity suffer men to change their wives as often as they please, and leave their children unprovided for in the arms of those whom they abandon. Any community which, by its legislation, offers scoundrels facilities of this kind for their scoundrelism, deserves to suffer, and all friends of pure manners have the consolation of knowing that it will suffer. No good breed of men or women ever yet grew up in a country in which marriage was lightly dissolved. Men who shine in either war or peace have to be produced in homes, and homes rapidly disappear in regions where husbands can get rid of their wives by paying fifty dollars to a knavish attorney. First the scamps do it, and then the honest men, being used

to seeing it done by the scamps, lose their horror of it, and laugh over it, and finally they do it themselves, and the public ceases to look on it as a wrong, and then the children grow up to regard marriage as a simple mode of gratifying a temporary passion, and their mothers as simply the instruments of their physical procreation, or—to speak plainly—their dams.

The new constitution of Hayti is a great improvement on that of '46, which it supplants. The principal changes are in the powers of the Senate and the Executive, which are greatly reduced, and—if we may judge from the omissions in the summary of provisions—in the treatment of whites, who, under Geffrard, had no political franchises whatever, and could not even hold real estate on the island. They are now apparently reckoned among the naturalized Haytians, who must have been five years in the country before being allowed to vote, while formerly only Indians and Africans could be naturalized, and might voto after one year's residence in the republic. This explains, too, why ten years' residence, instead of three, is required of naturalized citizens before they can be chosen representatives. The penalty of death for political offences is abolished. Extraordinary and extra-legal tribunals cannot be created, especially under the name of court-martial. All terms of office are shortened—the President being chosen for four years instead of for life, and not being eligible for re-election until four years after the expiration of his term; the Senators for six years instead of nine; the Representatives for three years instead of five. In impeachment of the President, also, which was not a constitutional remedy in 1846, and in the limitations of the veto, the example of this country has been imitated; but during the trial the Cabinet is charged with the executive authority. One provision is retained which is worth considering: the Senate (no longer appointed by the President but by the lower House from the nominations of the electoral colleges) is a permanent body that may adjourn, but only on leaving a permanent committee of five Senators, with power to convoke either the Senate or the whole Congress. To the National Assembly, or union of both Houses, are reserved the choice of the President, declarations of war, war regulations, the approval or rejection of treaties of peace, alliance, neutrality, commerce, and other international relations, the raising of loans, and the commutation of sentence passed on political offenders. The free-school system is confirmed and enlarged. The exercise of political rights may be suspended, among other causes, for persistent refusal to serve on a jury.

The large proprietors in Jamaica say they are in a worse plight than ever, and are trying to sell out and leave the island, and it is to be hoped they may succeed. After the specimen of their political capacity with which they have furnished the world, in their manner of governing, both in freedom and slavery, their presence can hardly be of any great benefit to any community. Lord Derby told, in the House of Lords, the other day, the story of his first entrance into public life, and it illustrated strikingly the mental and moral condition of that remarkable phenomenon of modern society—the West India planter. A member of the body being, as they all usually were, very short of money, was in the habit of selling the nomination for a small borough in which his influence was supreme, and the young Lord Stanley was indebted for his first seat in the House of Commons to a gentleman who bought it from the West Indian.

The Mexican paper *Libertad* has been attempting a justification of the Mexican dislike of foreigners, to which Escobedo has recently been giving such brutal expression, and alleges truly that foreigners have been the cause of a considerable portion of the Mexican troubles, owing to the attempts of their governments to interfere on their behalf for the redress of their grievances of one sort or another. Now if the *Libertad* will consider a little, it will find that there is no such perfect guarantee against foreign interference, and against all troubles from the presence of foreigners, as good government, including a good police, sensible legislation, and a pure administration of justice. It is this, far more than physical strength—this, and not savage proclamations and decrees, plunderings and slayings, which preserves weak states from the meddling of powerful neighbors. Poland fell because she had one of the worst governments the world ever saw, and not because Russia and Prussia were greedy; Turkey is for ever under the thumb of the foreigner because she has neither police nor courts of justice; but Switzerland and Holland, though weak states, and surrounded by powerful ones, have never to complain of foreign meddling, or to propose to cut foreign throats. If Mexicans would put Escobedo to hard labor in macadamizing roads, hang her brigands, collect her taxes, and establish tolerable courts of justice, we warrant there will be little talk anywhere of regenerating her from the outside.

The principal English jurors at the Paris Exhibition, including such men as Professor Tyndall, Scott Russell, and Dr. Lyon Playfair, have concurred in an expression of opinion that England has declined relatively in inventiveness and skill since the Exhibition of 1862. The Exhibition of 1851 in London showed that she was very inferior to her Continental rivals in the decorative arts. English furniture and carpets, and woodware and glass and china and metal, were far surpassed by the French and Germans in form and color and both. The result was that schools of design were established in nearly every large town in the kingdom, and a museum of art was established at Kensington, and the most desperate efforts made to rise in the scale. In 1862 it was found that English design was fully a match for that of the Continent, and in some fields surpassed it. There has since then been a corresponding struggle for the supremacy on the part of the French, and the English are again confessedly left behind, while it is admitted also that in most branches of manufacturing industry Continental nations are rapidly gaining on the English, owing, it is believed, to the better means of technical training which their people enjoy. The French have, for instance, the "École centrale des Arts et des Manufactures," the "Conservatoire des Arts et des Métiers," and the Schools of Bridges, Roads, and Mines, all supplied by the Government, besides a great number of local schools in special branches in nearly all the great manufacturing towns.

The Cable newsman has been fearfully puzzled this week by the condition of the English Reform bill in the House of Lords. He apparently finds it very hard to bring his great mind down to reporting the simple news of the day, so he told us one day that the Lords had rejected one of the most important amendments and passed the bill without it, and the next, that the House of Commons was violently excited by the receiving of the bill from the Upper House with this very amendment in it. He appears, in fact, to hate narrating facts, and delights in picturesque description and accounts of his own emotions. Still we admit that within the last month he has greatly improved.

The rumors of impending war in Europe, which were very rife some weeks ago, appear to have subsided somewhat, although there is still great uneasiness in financial circles. France continues to change her armament; and as soon as the troops have all received the Chassepot rifle, which they are as yet far from having done—that is to say, about next spring—we shall probably hear of trouble with Prussia, which will go on getting worse till the parties come to blows on some subject which nobody has as yet ever heard of. The course pursued when two great powers are "spoiling for a fight" is usually to get up a correspondence on some trifling matter, and then, in the middle of it, No. 1 asks what No. 2 is arming for. No. 2 replies that it is not arming; on the contrary, it has observed with regret that No. 1 is arming, but did not like to speak of it. No. 1 rejoins that it cannot be deceived in a matter of this sort, and must take the proper precautions; No. 2 declares that it cannot possibly support the burden of the armament that the performances of No. 1 has imposed on it, and begs that it will at once disarm; No. 1 pronounces this most extraordinary language, and appeals to Europe to judge between them, sends in an ultimatum, and then No. 2 crosses the frontier, and the ball opens. A logical analysis of the despatches which have preceded the last four great wars, beginning with that which followed the breach of the treaty of Amiens, would furnish, if done by Whately or Bentham, most amusing reading.

Notes.

LITERARY.

Messrs. Sheldon & Co. announce a "Memoir of Dr. Wayland," by his son, and "Waiting for the Verdict," by Mrs. Rebecca Harding Davis.——Messrs. Hurd & Houghton will publish "Tiger Lilies," an American novel by Professor Lanier.

—The early painters and engravers of New England form the subject of a very interesting monograph by Mr. William H. Whitmore, originally contributed to the proceedings of the Massachusetts Historical Society, and now reprinted with additions. The chief figure is that of Peter Pelham, "the pioneer artist," whose engravings were superior to any produced in the Colonies till the beginning of the present century. He made, in 1727, a portrait of the Rev. Cotton Mather on steel, from one previously made by him in oils, and from that time on he continued the use of his brush and his graver, chiefly on portraits, and those mostly of the leading clergymen. He also kept a school where he "taught dancing, writing, reading, painting upon glass, and all sorts of needle-work." He had come over from England, where, as afterwards in Boston, he had issue by his first wife. At her death he married the widow of Richard Copley, tobacconist and mother of John Singleton Copley, the famous portrait painter, father of the late Lord Lyndhurst. Young Copley undoubtedly was instructed by his step-father in both painting and engraving. Among the associates of Pelham was one Nathaniel Hurd, who engraved principally upon gold and silver, but also made book-plates and coats-of-arms, with now and then a portrait. He was a native of Boston, and his sister married Thomas Walley, an ancestor of Wendell Phillips. The patriot Paul Revere engraved portraits and caricatures, and had the entire manufacture of the paper money issued by the Provincial Congress of Massachusetts. For a short time, in 1773, Copley had a studio in this city on the west side of Broadway, going abroad the next year, and dying in England in 1815.

—Among recent English publications are the following: "Sound," eight lectures, of remarkable interest and novelty, delivered by Prof. Tyndall, at the Royal Institution (Longmans); "Norway, its People, Products, and Institutions," by the Rev. J. Bowden (Chapman & Hall); Mr. George Catlin's "Description of O Kee Pa, a religious ceremony, and other customs of the Mandans," with thirteen colored illustrations (Trübner); the first volume of Mr. A. Leith Adams's "Wanderings of a Naturalist in India," *i. e.*, in the Western Himalayas and Cashmere (Edmonstone & Douglas, Edinburgh); a translation of H. Taine's "Italy, Naples, and Rome," the critical notes of travel contributed to the *Revue des Deux Mondes*, by J. Durand; "The Hebraist's Vade Mecum," a complete verbal index to the contents of the Hebrew and Chaldee Scriptures, arranged according to grammar (Groombridge). Macmillan & Co. have in press "New Poems," by Matthew Arnold, and "Essays on a Liberal Education," by various writers, edited by the Rev. F. W. Farrar.——Judging from the review of it in *The Spectator*, "A Week in a French Country House," by Adelaide Sartoris (Smith, Elder & Co.), must be an entertaining book of admirably sketched characters, comparable with Mrs. Gaskell's "Cranford," but surpassing that in its effect of a "single social whole" such as is not "to be found even in the most perfectly amalgamated English societies." Louis Blanc's "Letters on England," second series, translated by James Hutton and L. J. Trotter (Sampson Low & Co.), are the effort of a foreigner who has for many years had his home in England to convey just ideas of that country and its people to his own countrymen across the Channel. Like De Tocqueville's "Democracy in America," they have value for the nation which is studied hardly inferior to that for the nation which is addressed. They should be prized, too, by Americans for the judgments they contain, not least because in 1863 the author announced clearly the revulsion in fashionable English sympathies that would ensue upon the downfall of the rebellion.

—Some of the above-named books are to be found among the recent invoices of Scribner, Welford & Co., which embrace also "Anecdotes of the Upper Ten Thousand, their Legends and their Lives," by the Hon. G. F. Berkeley, who figures as at least one upper-ten-thousandth in his gossiping chapters and two octavo volumes; Guizot's "Last Days of the Reign of Louis Philippe" (Bentley). On the same shelf are Lord Dufferin's "Irish Emigration and the Tenure of Land in Ireland," and "The Irish People and the Irish Land," being a letter to Lord Lifford, with comments on the publications of Lord Dufferin and Lord Rosse, by Isaac Butt. Sampson Low, Son & Marston send "The Book of the Hand," or the science of modern palmistry, with some account of the gipsies, by A. R. Craig, M.A. "Tell people," says the author, in his chapter on "The Hand as affected by Marriage," "who boast of their descent in a direct line from the great warriors of the ninth century, and who at the same time pique themselves on possessing a fine-pointed hand, that these are two pretensions that destroy each other. Every gentleman descended from the old nobility of the sword has necessarily the spatuled hand." The spatulous hand "has confidence in itself," it is "the hand of liberty." Charlemagne and Cæsar, Dædalus and Prometheus had it, Machiavelli also, and Peter the Great, and Diderot. The Yankee of course has it, being "reserved, selfish, and suspicious," but independent and free as well.——"Photographs of Eminent Medical Men of all Countries, with brief Analytical Notices of their Works," edited by T. Herbert Barker, M.D., will apparently make several volumes. The best-known names in Vol. I. are those of Prof. Owen, Sir James Clark, Dr. Acland, who accompanied the Prince of Wales to America in 1860, etc. The only foreigner mentioned is Prof. Donders, of the Netherlands. The photographs are finely executed.——In "Lancashire Folk-Lore," by John Harland and T. T. Wilkinson, are given the superstitious beliefs and practices, and local customs and usages, many of which are of feudal origin, in the "county palatine."——Rear-Admiral Slade (Musâver Pasha) contributes his portion to the history of the "balance of power" in "Turkey and the Crimean War," which deals gently with the Turks, accuses Napoleon of using England as a means of restoring France to the hegemony of Europe, and complains that the power of Russia has steadily broadened since her defeat at Sebastopol. The admiral prefers the continuance of the Ottoman rule in Turkey, and is jealous of a French establishment on the Nile.——Trübner publishes for J. Talboys Wheeler the first volume of his "History of India from the Earliest Ages," containing the Vedic Period and the Mahábhárata. There are 534 pages of text, besides a copious index.——Much may undoubtedly be learned from the two volumes, "Ti-ping Tien-kwoh," or history of the Ti-ping revolution, including the personal adventures of the author, Lin-le, who was on the inside of the Ti-ping lines, and bears strong testimony to the high character of the rebels. They constitute, he says, an incredible psychological phenomenon, a moral revolution; sprung from heathendom and casting off its worship and its vices, acknowledging the authority of the Christian Bible, abolishing slavery, and raising the status of women to almost that of civilized nations. They admit polygamy, but sanctify the marriage relation, allow divorce only for adultery, forbid the sale of young girls for concubines, forbid prostitution, forbid cramping the feet of women, instruct the young, and observe the Sabbath with the closing of shops, etc. They are the miracle of the century, the divine interposition to regenerate their native land.

—Why women do not "propose" to men, or why it is thought unnatural and improper that they should do so, is a question more easily asked, perhaps, than answered. A pleasing and illustrious example of what will, perhaps, one day be the fashion, when women have as independent support as men, is narrated of herself by no less a personage than Queen Victoria, in her new work, "The Early Years of his Royal Highness the Prince Consort," of which the first volume has just appeared in London, and which the Harpers are to republish at once. Prince Albert's letters are translated by the Princess Helena, and in one of them he writes:

"The Queen sent for me alone to her rooms a few days ago, and declared to me, in a genuine outburst of love and affection, that I had gained her whole heart, and would make her intensely happy if I would make her the sacrifice of sharing my life with her; for, she said, she looked upon it as a sacrifice. The only thing which troubled her was, that she did not think she was worthy of me."

The Queen reproaches herself with having previously entertained the thought of postponing their marriage, which had been talked of for them, for three years, and speaks feelingly and creditably of her loneliness when lifted from a life of seclusion at Kensington to the responsibilities of the throne. "A worse school for a young girl, or one more detrimental to all natural feelings," so she writes, "cannot well be imagined than the position of a queen at eighteen without experience, and without a husband to guide and support her." It is consolatory to reflect, however, that only very few girls are exposed to this misfortune. But it is the unreserved and informal display of her natural feelings which has made the character of Victoria so respectable, and which lends such a charm to the story of her courtship.

—We shall guess again, but this time merely from the internal evidence, that it is W. M. Rossetti who reviews Mr. Longfellow's "Dante," in *The Chronicle* of July 27. For even he, we think, can modestly and truthfully say that "it cannot be denied that the expressly poetic form of translation is higher and better than the expressly faithful form." Of those who have attempted the former he awards the chief praise to Cayley as fairly indicating and nearly approaching "the ideal of Dantesque translation." In the

latter class he names Pollock, himself, "whose preface shows that he believes Mr. Pollock not to have exhausted the maximum possibilities of faithfulness," and Mr. Longfellow. His general verdict is, "that there are very few works of poetic translation, in any language or of any period, which can compare for fidelity with this of the American poet," which, after all, "is not conspicuously more poetical than those of some predecessors in the form of blank verse." The use of such words as *benedight*, *misericord*, *tristful*, and the like, is censured, and some inaccurate renderings pointed out. The reviewer objects also to the "very lavish use of eleven-syllable lines," preferring his own ten-syllable. Mr. Longfellow, he finds, has mixed the hendecasyllabic with the decasyllabic in the proportion of two to five, or even three to six, imparting "a very prose-like sound" to the verse, and suggesting that the additional syllable was needed to get in the whole meaning of the text. With all these defects, of which the rhythmical is the most unexpected, "it is emphatically a fair and sound translation, and a good one, and eminent in point of usefulness."

—Opera-goers are familiar with the turning-point of the plot of "Linda," and the beautiful scene in which the heroine is restored to reason by hearing the melody she used to sing with her village mate. A similar incident has been powerfully employed by an English dramatist, Mr. W. G. Wills—also known as the author of a remarkable novel, "The Wife's Secret"—in a play called "The Man o' Airlie," of which *The Spectator* gives a gratifying account. We say gratifying, because the London stage seems floundering in the same depths with our own, or, as *The Spectator* phrases it, relies upon "carpenters and pretty women" for its audiences, as do our managers with their Black Crookery. But here comes a tragedy "in which there is no plot, in which the action does not turn upon love, in which there is no first-class female part, in which there is no room either for the comic or the farcical, and in which the main interest is of a kind the mass of play-goers necessarily cannot appreciate, yet which produces on the majority of them the most overpowering effect"—in other words, may become popular and successful. It is the story of an humble Scotch farmer-poet—perhaps suggested by the career of the English poet, John Clare—who loses his money and his wife in the city where he attempts to get his "sangs" published, and goes insane in consequence. Twenty years elapse, his songs become household, and the poor lunatic is present by accident at the inauguration of a statue to himself beside the loch of his childhood. The recital of one of his ballads forms part of the ceremony; his memory and reason awake together, he adds the final verse, "is recognized, recognizes, and dies a beggar at the foot of the statue raised to celebrate his glory as a poet."

—Paris, as it appears to the eye of the German tourist, has been described recently in a volume edited by Julius Rodenberg, in connection with several other journalists, *à propos* of the Exhibition. The book professes to give not a dry and complete enumeration of the curiosities and sights of Paris, but a perfect picture of the social and political life of the French metropolis. This end is attained with German conscientiousness and accuracy of observation, and with elegance, clearness, and vigor of expression. Herr Rodenberg, in the first chapter, sketches in outline "The Twenty-four Hours of Paris"—the buzz and bustle, the inner and outer life of the city; in the second chapter, Mr. Woltmann treats of "Art in Paris;" in the third, Mr. Marelle, under the head of "The French Mind, and Brain-work in Paris," gives a very clear description of educational centralization in France. In 1866, there were, in Paris, 500 ward schools, attended by from 70,000 to 80,000 children. Though nearly every village has an elementary school, every capital of each department its normal school, imperial or municipal *lycée* (preparatory college), and a few of the larger cities some academies, the higher educational institutions are centred at the capital. As soon as a professor has made a name in the provinces, he aspires to a chair in Paris, and thither the best pupils of the provincial colleges stream also, sometimes direct from their lycées. The remaining chapters discuss "The Men of the Bourse and Men of the Blouse," "The Misérables of Paris," "The Public Life of Paris," "The Parisian Journals," and "The Feuilleton"—the theatres, opera, concerts, Thérésa, etc. One of the most interesting features of the book is the statistics of crime, as stated by the Prefect of Police. There are about 10,000 criminals in Paris, and about 9,500 policemen ("sergens de ville"). The former are thus classified: Six thousand are always ready to take a man's purse from his desk or table, in the opera-box or in the café; three thousand would not mind searching his pocket for that purpose—without his knowing it; two thousand would not mind forcing his door, if it cannot be done otherwise; one thousand or twelve hundred would not be ashamed to disturb his nightly repose, by entering through the window or in any unusual way; six hundred only would be ready to murder him if he offered resistance, or tried to call for help, and so to betray them. Altogether the book is a very entertaining and readable one.

—"A singular epoch this of ours," says a French writer, "in which a Western emperor, seated beside the Grand-Turk, distributes medals of honor to the Pope and to the Czar, in an area filled with spectators from every corner of the earth." The Sultan, in fact, is only a conspicuous instance of the universal restlessness and desire for travel which the new routes and closer relations of the continents both stimulate and satisfy. Chinese, Japanese, and Arab jugglers go coursing round the world and perform at the door of every people. New York is nearly as much visited as Paris. When the Aïssaoua have abandoned the Théâtre International, they are as likely to come here as to go back to Algiers. It will be the arrival, however, not of a tribe or a profession, but a sect. They play with serpents, eat of them, pierce their hands with tapering swords, walk on the edge of scimetars, take red-hot coals and iron upon their tongues, and endure other frightful ordeals, and still they are really a sect. To the sound of barbarous music they dance like dervishes, with all manner of contortions, and finally fall to the ground in an ecstasy, foaming at the mouth, and limbs twisted and rigid. Their patron saint was the marabout Sidi-Mohammed-ben-Aïssa, who lived in Morocco about three centuries ago, and was the object of many favors on the part of Providence. Théophile Gautier wrote about him and his disciples in the *Revue de Paris* while that journal still lived. We remark that a daughter of Gautier (who translates herself for a *nom de plume* into "Mme. Judith Walter") has just published a French version of small poems from the Chinese, entitled the Book of Jade.

—A system of spiritualism and a science of ghosts are sought to be established by Professor Daumer in his work, "Das Geisterreich" (2 vols. Dresden, 1867; L. W. Schmidt, New York). The author, in the course of his long life, has passed through many changes, having been by turns a nihilist, deist, atheist, rationalist, till he became pious and more pious, went from the Protestant over to the Roman Catholic Church as the warmest of proselytes, and finally settled upon his present belief in ghosts and spirits. He introduces quite a new theory, to which originality of invention cannot be denied, and which strives to give some hold to the hitherto untenable. Spiritualism in Germany has, however, fewer confessors than in any other European country, decidedly less still than in ours, though it cannot be denied that even there it has lately gained accessions, to which Herr Daumer would fain add by his work. From the faith, ideas, and traditions of all nations and of all times, from Homer and Plato down to Shakspeare, Swedenborg, and Schopenhauer, he derives the raw material of his system. His chief sources for quoting opinions which he thinks corroborate his theory are not philosophers or naturalists, but poets. The "evidence of facts" he obtains chiefly from the following works: "Le Spiritualisme au dixneuvième siècle," Johnston's "Accredited Ghost Stories" (Lond. 1824), and "Memoirs of the Swabian Medium of Prevorst"—the most celebrated "medium" in Germany. The Professor asserts that ghosts are neither bodies nor souls, but a third entity which he calls *eidolon*, by which he understands the direct self-manifestation and representation of the *psyche* (soul). The soul is restricted to the corporeal exhibition only so long as it animates the body. Once released, by the death of the latter, it can manifest its immanent reality in any way it pleases. It can even reproduce whole episodes from its former life, including any number of figures of itself or of other persons. It can also produce sounds, and perform other material acts.

—"Sermons in stones" are proverbial. Czar Alexander I. would have none preached in his universities unless from Genesis. Nevertheless geology has not always taken its texts there. The professor, whatever may be said of his chronology, has devised an independent order of creation that cannot easily be controverted. But what a poor discourse of the world-history is that a coal shale yields, with its imprint or actual crust of fern or other vegetable, compared with that elicited from an Egyptian brick by Prof. Unger, and repeated to the Imperial Academy of Sciences at Vienna. The brick came from the pyramid of Dashour, and was shaped from the mud of the Nile 3,300 or 3,400 years before the Christian era. These are some of the heads of its sermon: Two sorts of grain, the pea, flax, wild radish, chrysanthemum, euphorbia, chenopodium, bupleurum, the vetch; chopped straw—a chapter from Exodus; fragments of pottery; a piece of twine spun from flax and sheep's wool; remains of fresh-water shells, insects, fishes, etc. The philologists have recovered much of the primitive manners of our race by analyzing words and roots, but here is a new process which has not only the weight of scientific exactness, but the allurement of a never-ending variety, since probably no two bricks would tell the

same tale. So the pyramid reared by slaves may be demolished by *savans*.

—The *Revue des Cours Littéraires* for May 11 gives specimens (of course in French) of the songs of Modern Greece, meaning by that Greece since the ninth and tenth centuries. These have been collected by Fauriel ("Chants populaires de la Grèce moderne," 1824) and, still more fully, by Passow. Those quoted in the *Revue* are taken from an Italian journal, *Il Gerdil*, and are not found in Fauriel, nor the first in Passow. The second, "The Fall [or Capture] of Constantinople," is among the Kleptic and popular songs which the late President Felton printed in his "Selections from Modern Greek Writers," 1856. These ballads have, in general, a decided flavor of brigandage, in which trade alone, perhaps, the spirit of patriotism could be preserved, and the most imaginative of them differ markedly from the poetry of Italy or Spain. We subjoin the beginning of the song called "The Recognition" (A.D. 962?):

"The Saracens plundered, the Arabs plundered; they plundered Andronicus, and carried off his wife, who was near her time. In prison she gave birth to a child, and nourished him in her chains. The mother nourished him with crumbs and milk; the princess nourished him with crumbs and honey. And the mother said to him as she nursed him: 'O my son and son of Andronicus!' and the princess said to him, 'O my son and son of thy prince!'"

In his version of "The Burial of Demos," Prof. Felton preserved the metre of the original, of which the conclusion runs:

"Build me a broad and spacious tomb, and let the mound be lofty,
That I may stand erect and fire, then stoop and load the musket;
And on the right hand of the tomb, a window leave wide open,
That swallows in their flight may come, the early spring announcing,
And nightingales of lovely May, in morning song, may tell me."

HISTORICAL NOVELS.*

THAT this species of composition still retains its hold on the popular taste may be inferred from the fact that two New York publishing houses have constituted themselves agents for the supply of the commodity. One of these houses offers a series of translations from the works of a prolific German authoress, which unveil to our democratic gaze the *vie intime* of a dozen monarchical courts, from that of Henry VIII. downward. The other deals in the historical tales of the author of "Mary Powell," a writer of extraordinary fecundity, of a most comprehensive range of information, and of a degree of "reconstructive" skill upon which Mr. Andrew Johnson may look with envy. We have not read the novels of Madame Mühlbach, and are unable to discuss their merits; but we have a sufficient acquaintance with those of the second-mentioned lady to warrant us in saying that they are neither so good nor so bad as they might easily be. We take it that they belong to the large class of works designed for the use of "young persons," and that if their purpose is to be commended, their effect, on the whole, and considering the abuse that is made of them, is rather to be deplored. They attempt to give the reader an idea of a given phase of the past in a degree less abstract than the manner of professed historians, and less rudely and dangerously concrete than that of the original documents of which text-books are composed. The result, of course, is somewhat anomalous. Histories are very long and dull; chronicles, memoirs, and reports, besides being inaccessible, are far too heavily charged with local colors. So the writer extracts the moral from the one source, and expresses the story from the other, and shakes them up together into a gentle and wholesome potion. The common expedient is to rescue from oblivion a supposititious diary or note-book, or collection of letters written in troublous times by some one of the supernumeraries of the play. The great novelists, Scott, Bulwer, Victor Hugo, Dumas, boldly lay hands on the principals (Elizabeth, Mary, Rienzi, Louis XI., Richelieu, etc.) and compel them to serve their unscrupulous purposes. But the author of "Mary Powell" wisely approaches the famous persons through the medium of their relations and dependants.

Sir Thomas More, as we all remember, had a daughter, a Mrs. Roper, of whom he was extremely fond, and who bore him company during his imprisonment. Our authoress accordingly takes this lady for her heroine, and relates—*à grand renfort* of capitals, italics, terminal *e*'s, and other simple antiquarianisms—the history of her early days. The effect is sufficiently pleasing, even if it is somewhat insipid, and it would seem that if the shades of Sir Thomas and his daughter exhibit no signs of offence, we disinterested moderns might allow the harmless device to pass without protest. A protest addressed to the author, indeed, we have no desire to make: we take it rather that the reader should here be put on his guard. Young girls divide their reading, we believe, into two sharply distinguished provinces—light and heavy; or, in other words, into novels and histories. No harm can come to them from the most assiduous perusal of our authoress so long as they read her books as stories pure and simple. They will find some difficulty, doubtless, in doing so, but the sacrifice is no more than a just one to the long-suffering historic muse. It requires some strength of mind on a young girl's part to persuade herself that a book with red edges, with archaic type, and with the various syntactical and orthographical quaintness which characterizes the volumes of which we speak—a book, in short, in which the heroine speaks familiarly of "dear old Erasmus"—does not possess some subtile and infallible authority with regard to the past. This, of course, is not the case. Such books embody a great deal of diligence and cleverness and fancy, but it is needless to say that history is quite a different matter. The reader who bears this in mind may spend a pleasant half-hour over the fortunes of Mrs. Mary Powell and her various companions.

If the books in question are extensively read, slight as are their merits, it is logical to suppose that people are still kindly disposed toward the real historical novel; and that if in these latter days it has had but few representatives, the fault is rather among writers than readers. The study of history has in recent times acquired an impetus which would greatly facilitate the composition of such works. We know very much more at present than we knew thirty years ago about manners in the Middle Ages and in antiquity. Novel-writing, too, has taken a corresponding start. For one novel that was published thirty years ago, there are a dozen published to-day. But, on the whole, the two streams have kept very distinct, and are, perhaps, not destined to be forced into confluence unless the second half of the century turns out a second Walter Scott. Both history and romance are so much more disinterested at the present moment than they were during Scott's lifetime, that it will take a strong hand to force either of them to look upon the other with the cold glance of the speculator. The great historians nowadays are Niebuhr and Mommsen, Guizot and Buckle, writers of a purely scientific turn of mind. The popular novelist is Mr. Anthony Trollope, than whom it is certainly difficult to conceive a less retrospective genius. It is hard to imagine minds of these dissimilar types uniting their forces; or, rather, it is hard to imagine a mind in which their distinctive elements and sympathies should be combined; in which a due appreciation of the multifold details of human life and of the innumerable sentiments and passions which lie in ceaseless fermentation on its surface, should coexist with the capacity for weighing evidence and for following the broad lines of progress through the almost irreclaimable chaos of political movements and counter-movements. Historians and story-tellers work each in a very different fashion. With the latter it is the subject, the cause, the impulse, the basis of fact that is given; over it spreads the unobstructed sky, with nothing to hinder the flight of fancy. With the former, it is the effect, the ultimate steps of the movement that are given; those steps by which individuals or parties rise above the heads of the multitude, come into evidence, and make themselves matters of history. At the outset, therefore, the historian has to point to these final manifestations of conduct, and say sternly to his fancy: So far shalt thou go, and no further. A vast fabric of impenetrable fact is stretched over his head. He works in the dark, with a contracted forehead and downcast eyes, on his hands and knees, as men work in coal-mines. But there is no sufficient reason that we can see why the novelist should not subject himself, as regards the treatment of his subject, to certain of the obligations of the historian; why he should not imprison his imagination, for the time, in a circle of incidents from which there is no arbitrary issue, and apply his ingenuity to the study of a problem to which there is but a single solution. The novelist who of all novelists was certainly the most of one—Balzac—may be said, to a certain extent, to have done this, and to have done it with excellent profit. At bottom, his incidents and character were as fictitious as those of Spenser's "Fairy Queen;" yet he was as averse from taking liberties with them as we are bound to conceive Mr. Motley, for instance, to be from taking liberties with the history of Holland. He looked upon French society in the nineteenth century as a great whole, the character of which would be falsified if he made light of a single detail or episode. Although, therefore (if we except his "Contes Drolatiques"), he wrote but a single tale of which the period lay beyond the memory of his own generation or that preceding it, he may yet in strictness be called a historical novelist, inasmuch as he was the historian of contemporary manners. In Balzac's day and in Balzac's country, there was a fixedness and sacredness about social custom and reputation which furnished his critics with a measure of his fidelity. This fixedness and sacredness are daily growing less, but they will always exist among civilized people in a sufficient degree for a novelist's purposes. The manners, the ideas, the tone of the *moment*, may always be seized by a genuine

* "The Household of Sir Thomas More. By the Author of 'Mary Powell.'" New York: M. W. Dodd. 1867.
"Jacques Bonneval; or, The Days of the Dragonnades. By the Author of 'Mary Powell.'" M. W. Dodd. 1867.

observer, even if the moment lasts but three months, and the writer who seizes them will possess an historical value for his descendants.

These remarks, however, will be thought to confer an undue extension upon the meaning of our term, and we hasten to restrict it to those works of fiction which deal exclusively with the past. Every one is familiar with the old distinction among historical tales into those in which actual persons are introduced, and those in which actual events are transacted by merely imaginary persons, as is the case, for instance (if we are not mistaken), with Charles Dickens's "Tale of Two Cities," in which a very vivid impression is given of the French Revolution without the assistance of any of the known actors. Novels of the former class are certainly the more difficult to write (for a man of conscience, at least), and novels of either class are more difficult to write than works which require no preparation of mind, no research. But story-tellers are, for the most part, an illogical, loose-thinking, ill-informed race, and we cannot but believe that this same research and preparation constitute for such minds a very salutary training. It is, of course, not well for people of imagination to have the divine faculty constantly snubbed and cross-questioned and held to an account: but when once it is strong and lusty, it is very well that it should hold itself responsible to certain uncompromising realities. There are a number of general truths of human nature to which, of course, it professes itself constantly amenable; but in many cases this is not enough, and particular facts of history are useful in completing the discipline. When the imagination is sound, she will be certain to profit; and so, on the other hand, history will be likely to profit. We speak, of course, of a first-class imagination—as men occasionally have it, and as no woman (unless it be Mme. Sand) has yet had it; for when the faculty is weak, although the practice of writing historical tales may strengthen it, it will be almost certain to dilute or to pervert the truth of history. George Eliot's "Romola" is a very beautiful story, but it is quite worthless, to our mind, as a picture of life in the fifteenth century. On the other hand, Thackeray's "Esmond," although it may abound in those moral anachronisms which a historian proper may almost as little hope to avoid as an historical novelist, yet, on the whole, is almost as valuable as an historical picture as it is as a work of sentiment. Of the two writers, one would hardly have said, *à priori*, that in an attempt of this kind the latter would have been more likely to succeed. He, doubtless, owes his success in a great measure to the fact that he did not venture too far from the shore. He, too, would have made poor work of the days of the Medici. In treating of Queen Anne's times, he only humored a natural predilection. At the present time men of literary tastes may be said to be born with historical sympathies and affinities, just as men are said to be born Platonists or Aristotelians. Some of us find an irresistible attraction in the Greeks, some in Feudalism, some in the Renaissance, some in the eighteenth century, some in southern and some in northern civilizations. To *humor* these sympathies, as we say, and still to respect them, may be an act fruitful in charming results. Let men of imagination go for their facts and researches to men of science and judgment, and let them consult the canons of historical truth established by the latter, and both parties can hardly fail to be the better for it. Proof of this has already been offered more than once in English letters. Mr. Charles Reade's "Cloister and the Hearth" is an historical panorama to which no intelligent man, however learned he may be, need be ashamed to attach credit. This writer has extraordinary powers of divination—we can't express it otherwise; and the most judicious historian, we sincerely believe, cannot read the tale in question without confessing that there is a light there thrown upon the past which is eminently worth being thrown, and which it was not in his own province to produce. He will return to his own more austere labors with a renewed sense of their dignity, and both parties will thus be the wiser.

TWO BOOKS BY MRS. CHILD.*

The friends and admirers of Mrs. Child are likely to miss, in the ingenious and generous novel before us, none of the fine or endearing qualities of heart or brain which, during a literary lifetime of little less than half a century, have made them her friends and admirers. The "Romance of the Republic" can boast of graceful fancy, ready resource, lofty conscientiousness, and a most catholic liberality and charity.

In one respect, the author labored under a disadvantage. If she has conquered it, as the reception of the public will probably bear witness that she has done, it adds to her triumph. She had, namely, a lively book to make out of a dead subject.

For slavery, as slavery, is dead in our republic. Its ghosts, no doubt, may long haunt the unhappy South in the forms of mutual jealousies, of attempts at unjust and tyrannical State and town legislation, of the frauds of employers, and of irregular outrages committed by bullying whites upon helpless blacks and occasional attempts at revenge on the part of the blacks. But slavery has lost the omnipotent sanctions of national law and national religion. Overseers can now no more be lawfully and piously required to lash black *Toms* for telling the news; nor are accomplished and beautiful Misses *Flora* and *Rosa* in danger at present of finding themselves unexpectedly set down in the inventory of bankrupt fathers' household goods. Such fantastic iniquities as the latter especially seem to fly with a jerk far back into the past, to take their natural place by the side of gratuitous dentistry bestowed upon close-fisted Jews and the consumption of free-thinkers for fagots.

One theme, however, suggested by both of the works before us, is doomed to force itself upon public attention more and more while time wears on, and the lately subject race grows, as all Christian souls must wish that it may, in culture, prosperity, and consequent consideration. That theme is the social and domestic relations to be sustained hereafter between our innumerous freemen and our numerous freedmen. Professor Petroleum V. Nasby's famous matrimonial question is not likely, indeed, to come up very often in polite life quite so broadly as he put it. We hardly expect even far-eyed posterity to see the parts of Desdemona and Othello enacted in earnest in the drawing-rooms of New York and Boston. But in instances where the admixture of Ethiopian blood is so small and so remote as to have become a mere matter of tradition, wealth and intellect in man, and wealth and beauty in woman, may cast their wonted, not impotent spells over Hymen, and, in the struggle to betray caste into *mésalliances*, may call up a little black blood sooner or later in hearts of the purest European origin.

Either we are particularly obtuse, or the plot of the "Romance" is particularly artful in the episode of the exchanged Fitzgeralds. In reading of the period wherein it took place, we wondered somewhat that the writer should, as we supposed, overlook or spurn so tempting an opportunity to embarrass and confound the children of her imagination; and we scarcely thought of it again until the explanations brought about by the meeting of the mature Rosa and her son. A peculiarly happy tact is to be seen in the management of this portion of the story. While it does not fail to show how of its own nature crime multiplies itself into crime, it involves the poor, distracted Rosa in no transgression that unsexes her; and it is even made a means through her repentance and atonement of exhibiting to us her lofty and delicate moral sense.

The moonlight military encounter of the strange brothers may remind the reader of De la Motte-Fouqué of a similar surprise in the "Zauberring." But the treatment of the incident is so different in the different stories as to leave room for a doubt of so much as the one story-teller's acquaintance with the other; and, at any rate, if we recollect right, we have Sir Joshua Reynolds's authority for saying that to borrow an old idea and make it over into a new one is not plagiarism.

Whether, in real life, habit would have prevailed over nature as in the case of the "Lily-mother," or whether the octoroon (or sexdecimroon) son would have carried the day against the mulatto daughter-in-law, we can hardly conjecture. Probably that would have been decided in any case by the idiosyncrasy of the individual, unless it was the case of an individual of higher principles than Mrs. Fitzgerald's. The question is decided here in much apparent conformity to her superficial nature. As long as her world looked upon the supposititious son as her own, so long, at least, she was glad to look upon herself as his mother.

The author, we think, gives a hint that deserves attention when she makes Mr. King withhold from his young Eulalie the dark pages of the history of her family. We do not believe that much knowledge of the evil that is in the world can be in general wholesome knowledge for persons who have not yet reached an age to meet and to cope with the evil that is in the world. Accordingly, it strikes us that the "Romance," pure and noble as it is in its own tone of thought and feeling, may scarcely be fitly classed under the head of lessons for the school-room.

The same observation applies to some, though not to all, of the tales in "Fact and Fiction: A Collection of Stories," whose copyright dates so far back as 1846. Of these, it may be a sufficient recommendation to say that though by no means childish, they are eminently Childlike. "The Neighbor-in-law" is, on the whole, perhaps the best. Two or three pages of the wild fantasy, "Hilda Silfverling," incline one to wish that the narrator had

* "A Romance of the Republic. By L. Maria Child." Boston: Ticknor & Fields. 1867.
"Fact and Fiction. A Collection of Stories. By L. Maria Child, Author of 'Letters from New York;' 'Philothea;' 'History of Women;' 'Flowers for Children,' etc," New York: James Miller. 1867.

oftener entered the lists of gramarye with Hans Christian Andersen. By the way, we hope and strongly suspect that that exquisite fairy story, "The Fountain of Beauty," in one of her former compilations, sprang out of her own inkstand. Finally—but we have discovered no reason for bidding good-by to Mrs. Child. Let us merely echo her beautiful heroine's "*Hasta luego*," and conclude with the apposite remark of Apollo:

> "What a wealth it would bring to the narrow and sour
> Could they be as a *Child* for but one little hour."

CARLYLE'S "FREDERICK."*

WHOEVER has read the author's "French Revolution" will, perhaps, not be amazed that the last style of this man is even worse than the first. The reader must, in fact, wade through the familiar pluralizing of abstract nouns; through "wisdoms" and "pedantisms" and "rumorings;" through the also familiar vagueness of sounding phrases—"a wild congeries of electric simultaneities," "circumambient thunder-clouds of Tolpatches," and "the Diplomacies, the vaporous Foreshadows, and the general Dance of Unclean Spirits, with their intrigues and spectralities;" through, in short, pages strewn with obscure allusions and capital letters in the German fashion, to the medley of Teutono-Anglo-Saxon and Romano-Gallo-Norman words, forms, and turns, and Hoch-deutsch, Platt-deutsch, and semi-barbarous Friedrich's-deutsch—all capriciously used, sometimes charmingly, but to the unlearned reader mostly confusingly. Carlyle's historical writing is largely indebted for its graphic qualities to a persistent repetition of the traits with which he originally invests a character—traits which are generally symbolical, often satirical, and always pictorial. This peculiarity tends to become wearisome, and we have a good example here in the description of Kaiser Albert, of whom it is first said that he "was by no means a prepossessing man;" of "ugly character and face to match;" "big-nosed, loose-lipped, blind of an eye—not Kaiser-like at all;" then, on the authority of Pope Boniface, "est homo monoculus, et vulto rustico; non potest esse Imperator," and this translated again into "a one-eyed fellow, and looks like a clown; he cannot be an emperor;" and, after all, a recurrence to "the same Albert of the unlovely countenance," "that same one-eyed, loose-lipped, unbeautiful Albert." We are glad by this time to turn to another portrait.

But these blemishes need not be dwelt upon. They must be forgiven, as they occur interspersed with anecdotes plentiful and wittily told, and with a great number of fine historical or biographical sketches, by turns gentle, brilliant, masterly faithful—of Hochmeister Albert, for instance; of the Great Elector and his ride from Carwe to Gilge; of Frederick I.'s death; of Sophie Charlotte; of Frederick II., the child (Fredkin, Fritzkin), compared with old king grandpapa; of the same Frederick's intellect, character, and appearance when old; of Louis XV.'s sickness; of the battle of Prag (year 1757); of Frederick after the battle of Kolin; of the French Revolution; and many others like these. Some may be finer, many are less fine, some very tedious. Will a diligent reader's patience carry him through the "Cleve Heritage" business, for instance—through the "Double Marriage" affair—the "Affair of Herstal"—and enchain him to "Frederick Preparing for a New Campaign" (Dec. 1744)? Will he stand all the talk of "ruffian Trenck," "Jenkins's ear," the "Spanish Termagant," "Baby Carlos," Wilhelmina, Grumkow, Seckendorf, Bellisle, Valori, Maupertuis, "the divine Emilie;" of Czar Peter's and Saxon-Polish Augustus's "unspeakable," yet too much and too frequently spoken of "pollutions," besides many other cynically indecent and profane things and utterances, of which Clio may not blush, if she can help it? Does scrupulous historical fidelity demand such sacrifices of an otherwise venerable votary of hers? Or does he, too, submit to the dictates of a depraved vulgar taste, or cease to brave the temptation of being highly sensational? And what unexplainable rudeness of language is there in that story of "Margaret with the Pouch-mouth," poor soul!

Exaggerative, like himself, this narrative of Carlyle's is the largest, and you might say, also, the grandest of his productions, if you had read it through. Thirty-two hundred pages on that Teutsch but un-Teutsch-looking, un-Teutsch-speaking, by turns Voltaire-worshipping and Voltaire-trampling, admirably just and stupendously violent, sublimely philosophical and royally feeble ruler and conqueror of peoples, cultivator and divider of countries—thirty-two hundred pages on him and, by way of introduction, on his predecessors, and almost all, omitting digressions, in praise of him and them! All that is good in him and them—thrift, solidity, truthfulness, heroism, piety, genius—extolled beyond measure before admiring mankind, extolled as chiefly Hohenzollern-Prussian virtues; all that is mean, ignorant, flagitious, profligate, inhuman, in him and them, passed over rapidly though not silently, judged leniently, extenuated, and—if that be possible—excused or justified! All unproved accusations spurned with utmost contempt and almost furious vehemence! Is there against Friedrich a *corpus delicti* unspurnable? Dead or alive, it will be trampled under foot, mangled, dragged through the mire, and hooted over, even were the victim not a "ruffian" Trenck, but a Poland, a nation torn in pieces by the hero and two sovereign accomplices, though the hero himself, when *he* is similarly assailed by three, writes to "dear sister" Wilhelmina: "If, in common life, three citizens took it into their heads to fall upon their neighbor, and burn his house about him, they, very certainly, by sentence of tribunal, would be broken on the wheel."

There remains the zealotic, exaggerative partiality for things Protestant, Puritanic, royally heroic (even when not nobly heroic), and against things mutinous, anarchic, "chaotic," democratic, parliamentary, (palaverish), progressive, and also things Jesuitic, Austrian, non-Teutsch (non-Teutonic, though "poor England," too, gets her share of rebuke). And yet we counsel those who have leisure, to read with patience, and also with delight and to their benefit, these thirty-two hundred pages on the life of Friedrich, or a large part of them; for there is much brain and soul in them, and no stupidity. "On the life," we say, not on "the life and reign," for what you have before you here is a biography, not a history. You look on Friedrich, his kindred, his friends, his enemies, his generals, his warriors, his fights, his struggles, his marches all, his vigils, his triumphs, his defeats, his joys, his griefs, his rages, his labors, his relaxations, his Voltaire—all grandly resuscitated in vivid, well-illumined, strikingly-executed life-pictures. But where is the people, its life, manners, condition, its country and towns, its sweats, tears, and industries, its beliefs and hopes, its thoughts and mental creations, its Teutsch literature, its Kant, its Lessing—all ignored by Friedrich? Neither these, nor vestiges of these, appear in the text or in the copious, carefully prepared index; on the battle maps—also carefully prepared—perhaps they may appear.

In the Year '13. A Tale of Mecklenburg Life. By Fritz Reuter. Translated from the Platt-deutsch by Charles Lee Lewes. Tauchnitz edition. (New York: Leypoldt & Holt.)—This is the era of novelties in novels. Mr. Schuyler inaugurates our acquaintance with the popular Russian writer, Turgenef, by his translation of "Fathers and Sons," while Mr. Lewes gives the public the first one of Reuter's novels ever done into English—Reuter, the fashionable author of the day in Germany, as we mentioned last week in one of our literary notes. The translator says in his preface of this story, "It is one of a series to which Reuter has given the name of 'Olle Kamellen,' literally 'old chamomile flowers,' by which he means 'old tales and old recollections, useful as homely remedies.'" The scene is laid in Stavenhagen, or Stemhagen, Reuter's native town. The characters introduced are all real people, even to their names.

"The story opens"—we may as well quote again from the preface—"at the moment when the German people was at length beginning to rise against Napoleon, and it gives a vivid picture of the state of feeling which then prevailed in Germany toward the French. The Germans were in the galling position of being forced to treat the French as allies, whilst hating them with an intense and unconquerable hatred. And this hatred, widespread over the whole country, is shown in the expressions of detestation ever bursting forth at the mention of the French name."

Unless they are written with a biographical intent, sketches from real life are not apt to have heroes. In the true history of a little town there are many parts played, and each is important in its own way. There is not always a wooing going on, around which the interest centres, and to whose development all events, favoring or adverse, contribute. So in "In the Year '13" the tender passion has a very subordinate *rôle*. The love of Ficka and Heinrich is only a pretty rill of sentiment which runs through the broad field of the story; it makes the grass a brighter green, to be sure, but it is almost hidden under it. The chief personage is the Herr Amtshauptmann Weber, whom the author pictures with a humorous affectionateness that is very taking. The old man was one of Reuter's four godfathers:

"He used to wear a well-brushed blue coat, yellowish trousers, and well-blacked boots, and his face was so marked by the small-pox that it looked as if the devil had been threshing his peas on it, or as if he had sat down upon his face on a cane-bottomed chair. On his broad forehead there stood written, and in his eyes, too, you could read, 'Not the fear of man but the fear of God.' And he was the right man in the right place.

"About eleven o'clock in the morning he might be seen sitting in an arm-chair in the middle of the room, whilst his wife fastened a napkin under his chin, put the powder on his hair, tied it behind, and twisted it into a neat pigtail.

"When the old gentleman walked up and down under the shade of the chestnut-trees at noon, his little rogue of a pigtail wagged merrily, and nodded over the collar

* "History of Friedrich the Second, called Frederick the Great. By Thomas Carlyle." 6 vols. New York: Harper & Bros. 1864-66.

of his blue coat as if it wanted to say to any one who would listen: 'Yes, look, old fellow! What do you think of me? I am only the tip of his hair, and if I can wag so comically out here, you may fancy how merry it must be inside his head.'"

Then there was the Herr Rathsherr, who was stout and red and otherwise magnificent to behold. He was Fritz's uncle Herse; and at the supper in celebration of the return of himself and some fellow-burghers from the clutches of the French, as he sat at the head of the table complacently appropriating to himself all the glory of the occasion, and crowned with laurels by a doting wife, Fritz admired him and thought him like Julius Cæsar, only handsomer. The Herr Rathsherr's forte was mystery. He was in everybody's business, and full of secrets. The difficulties that he gets into are made a good deal of, and seem to us a little dull, but are not the only "situations" of trifling substance which are redeemed by the gusto with which they are portrayed. The lively personal interest which the author takes in drawing his characters creates a sympathy between him and the reader that procures even for the trivialities of his tale at least respect if not a warmer feeling—that with which we listen to histories of the past from the old folks at our own fireside. To children and to the old especially, his style will be charming. Poor Mamsell Westphalen's troubles with that naughty boy Fritz Sahlmann, who was unscrupulousness itself where sausages were concerned—"Fritz Sahlmann and Truth are as far asunder as the Cuckoo and the Seven Stars," she used to say; the same good lady's complications with the small and inoffensive Herr Droi; the wonderful rumpus kicked up by a few French chasseurs in the quiet town; the drilling of the little volunteer force by the old Herr Amtshauptmann, who drove to the field in a carriage in which he permitted "his children" to lay their pikes as they returned from rehearsing battles, until his innocent vehicle "looked like an engine of war, like some scythe-chariot out of the Roman and Persian times"—all these incidents are narrated and, to be enjoyed, must be listened to in the spirit of home and of love. Outside of that, a spirit of criticism will find a few mannerisms to object to, such as the headings of the chapters, which are constructed on the principle of conveying the least possible idea of what is to follow, and which, though funny at first, grow exceedingly wearisome. But we merely mention them.

The Man with the Broken Ear. Translated from the French of Edmund About, by Henry Holt. (New York: Leypoldt & Holt.)—Our readers will recollect that Colonel Fougas, the hero of this story, was once before the subject of some remarks in THE NATION. He was the man who was desiccated in Herr John Meiser's laboratory in the year 1813, reposed there in a threefold-box until the death of the postponer of his being (if he may so be called), and was knocked around as a mummy in various places from that time until 1859, when he was purchased for twenty-five louis by a young fellow-countryman, in whose house he was resuscitated by the learned Dr. Nibor, in the presence of many witnesses. All this, if not quite true, is almost as good as true in the hands of M. About. He tells the story with such delightful circumstantiality and scientific gravity, that all one can say is, that if it isn't veracious, then it ought to be. On this clever substratum M. About goes on building his dramatic satire—the First and the Second Empires laid cheek by jowl—the beginning and middle of the nineteenth century suddenly confronted with each other. Colonel Fougas is not enough of a progressive to enjoy the world as he finds it on his resurrection; or perhaps it would be more correct to say, that not finding it progressed in certain pet particulars in the way he had planned it should, he is not amused at all. A wiser man could not have afforded scope for half the fun that this very short-sighted, very human fellow does. M. About does justice to all the comically touching points in the picture afforded by the aged-youthful condition of his hero; especially that where, joyfully anticipating the arrival of his commission as brevet-brigadier, he is handed an official letter stating the necessity of placing him on the retired list on account of his age (which is 70 years), the limit for brigadiers being sixty-two!

"I know, Monsieur," the letter goes on to say, "how little this measure is justified by your apparent age, and I sincerely regret that France should be deprived of the services of a man of your capacity. Moreover, it is certain that an exception in your favor would arouse no dissatisfaction in the army, and would meet with nothing but sympathetic approval. But the law is express, and the Emperor himself cannot violate or elude it. . . There is not even an office in the civil administration in which, even by special favor, a man seventy years old could be placed. You will very justly object that the laws and regulations now in force date from a period when experiments on the revivification of men had not yet met with favorable results. But the law is made for the mass of mankind, and cannot take any account of exceptions. Undoubtedly attention would be directed to its amendment if cases of resuscitation were to present themselves in sufficient number."

Suicide is the not unnatural conclusion of a man whose occupation is so wholly gone as was this one's; for the Emperor's permission for him to be an exception came too late. M. About is not very quotable, except in long passages, the wit generally depending on a knowledge of what has gone before; otherwise we should be tempted to transcribe the dream of Léon Renault, whose methodical madness is the vehicle of more cleverness than any invented dream ever carried before. It should have many readers. Mr. Holt's translation is vivacious and natural, but would be improved by the correction of the Middle-States vulgarism that uses "like" for "as."

Mrs. Brown's Visit to the Paris Exhibition. By Arthur Sketchley, author of "The Brown Papers." (London and New York: George Routledge & Sons.)—One may get a good deal of amusement out of Mrs. Brown if careful to take her a little at a time and that seldom—to use her own method of expressing it. Mrs. Brown is her own spokeswoman, and in a garrulous and sometimes tedious narrative she gives an account of the haps and mishaps—chiefly mishaps—that befell her and her party in their visit to Paris. The party is eminently British; but when we have said that there were two fat women, Mrs. Brown and Mrs Archbutt, and two thin ones, Miss Tredwell and Mrs. Wells, and three husbands, all equally ill-natured, we shall have individualized them almost as much as Mr. Sketchley has done. The chief fun of the book is Mrs. Brown's unpunctuated and unlimited flow of language, after the style (but not the wit) of "Sairey Gamp." Paris she "know'd was a dressy place. . . . I would n't 'ave no scarcity of clothes, so took my large 'air-trunk, as is a useful size, and did once 'ave brass nails all round, as was nearly all picked out by a cockatoo with a yaller top-knot, as was brought from sea by a captain as once lodged with me, and was kep' on a perch with a chain to 'is leg, jest long enough to reach that box, only one night, and not a nail in the top on it as he had n't picked out afore mornin'."

This "'air-trunk" contained most remarkable "muslings," which were paraded at the Exhibition. "Me and Mrs. Archbutt was a-settin' a-talkin', and if there wasn't a lot of them French a-makin' remarks on us and a-grinnin', as I says a set of grinnin' baboons—that's what I calls 'em, tho' certainly Mrs. Archbutt is one of them parties as looks conspicuous, as the sayin' is; for she's as broad as she's long, and a face that red as flambeaus is a fool to it, and will dress that showy, a-sayin' as blue becomes 'er and made her look young, as is 'er fancy, poor thing, as nobody with a 'art would n't contradict 'er in, as is a 'armless delusion as ever I know'd." The two ladies marched about looking at the show, till, as Mrs. Brown said, her "feet was that hagony as I could 'ardly abear to put 'em to the ground." They lose Brown—"not a westment on 'im was n't visible nowheres." So Mrs. Brown stops one of them police and says to him: "'Brown—passy ici,' as I know'd was French for 'pass here.' He stares at me, and then jabbers something about 'passy,' and I say, 'Yes, passy. Brown, ... as is a fine-figgered man in a dark surtoo, with drab pants, and a bend in 'is back like a magistrate, as many 'as often said to me, 'Miss Brown, mum, to foller your good gentleman any one would take 'im for a Royal Family behind, as is a noble forehead with a commandin' nose, and any one could tell in an instant among a thousand, with a eye like a 'awk a-beamin' on you.' So I says, 'have you seen 'm anywheres about?' If that idjot did n't say as he couldn't comprehend."

This style of talk keeps itself up without much brain-work, and Mr. Sketchley is often obliged, in default of better humor, to make old ladies fall down, tumble about, knock wigs off, brandish umbrellas, and get into innumerable scrapes of the low farcical order. The people who enjoy this kind of "experience" in others will best like Mr. Sketchley's production.

Beet-Root Sugar, and Cultivation of the Beet. By E. B. Grant. (Boston: Lee & Shepard.)—This little book presents, in good, direct style, the history of the article in Europe, proofs of its adaptation to the soil of the United States, its value compared with corn and wheat, cost of production in Illinois and elsewhere, and hence the author's conviction of its profitableness even in competition with the tropical beet or our own cane sugars. The profit on crops in Illinois is over 80 per cent., besides the fertilizing of the land and the fattening of the cattle. The book concludes with an exhaustive description of the various kinds of beet, and the whole art of its cultivation.

The Mineral Waters of the United States and Canada. By J. J. Moorman, M.D. (Baltimore: Kelly & Piet.)—The author discusses the medicinal value and application of mineral springs generally, describes those of his title-page more or less particularly, and dwells chiefly on that of the White Sulphur, in Virginia. The general discussion seems sensible, the descriptions of Northern and Western waters are fairly analytic, that of the White Sulphur seems exhaustive chemically, topographically, artistically, and socially. The style is common, except in the chapter on White Sulphur society, where it gets "highly charged" with the native Virginian "high-faloot."

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

PERSONAL REPRESENTATION.

THE growing feeling in favor of the representation of minorities, both here and in England, is one of the many proofs that, however attached people may be to the principle of democracy, they are not yet satisfied that they have hit on the best mode of applying it.

The people, even of New York city, really want a good government, they really want good men in office; if they did not, we should be ready this moment for Mr. Cushing's "man on horseback." But they have no power to secure a good government and good men in office, because they possess no adequate control over the nominations made by party leaders. A nomination once made is a finality—fit or unfit, it must be sustained at peril of the odium of "treason to the party," or the more real and serious responsibility of "giving aid to the enemy." Once overthrow the oligarchy of wire-pullers, make it possible in some way for the people to withhold their approval when incompetent or dishonest men are put into nomination, and other political reforms would speedily follow.

It would appear, at first sight, that a power which, like that under discussion, is exercised by wholly irresponsible private citizens, is of a so purely moral nature that it cannot be reached by legislation, but must be left to the good sense of the people to deal with. But this is precisely what we have been doing now for many years, and with only the result of seeing party despotism grow stronger and stronger. And the reason is that our political organization, being based entirely upon local districts, and multiplying to excess the number of officials chosen by popular vote, affords every facility for the manipulations of wire-pullers. If it is possible, either by statute or constitutional provision, to remove these peculiar opportunities and temptations, the evil will, in a great measure, come to end of itself. It is not desired to interfere in any way with the legitimate action of party organizations. These are an indispensable instrumentality in enabling like-minded men to combine their scattered forces and bring them to bear upon definite objects—thus converting latent power into active power. But what we do need is to give individual opinion a chance to make itself felt upon these organizations, and render it possible to "scratch" a bad nomination without practically voting for the opposite candidate.

Mr. Hare's plan of personal representation, to which attention has been so widely directed of late years, promises to accomplish this object; and we wish to suggest what seems to be a feasible way of adapting the leading principle of his plan to our American community and institutions. It is certain that, in the form in which he has developed it, it is so complicated and tedious that, whether intrinsically good or bad, it never could obtain approval or even serious consideration among our people. Whether the fact is to our credit or not, we may make up our minds at the start that no plan has any chance of adoption among us which is not easily and readily understood, and which does not provide for ascertaining the result of an election as early as the day after it takes place.

The undue stress laid, as well by Mr. Hare himself as by all who have advocated his plan, upon unessential details, which concern merely the method of putting it in practice, has had the effect of drawing the attention away from the essential principle of his scheme. This essential and fundamental principle is simply this—that it is the *people* who are represented, and not the *place;* and that, therefore, constituencies should be *personal*, and not *local*. According to this plan, if a citizen of Syracuse wished to vote for Horace Greeley for Congress, or a citizen of Brooklyn for Millard Fillmore, he would have the right to do so; his vote for this candidate would count for him with those cast in every other section of the State; and the constituency of the successful candidate would be those who voted for him, wherever they happened to reside.

This is the simple and philosophical feature of Mr. Hare's plan, which has obtained the unqualified commendation of Mr. Mill and other thinkers; the rest of his scheme consists of devices for obtaining an absolutely equal representation of a community upon this general plan; devices adapted, perhaps, to the English people, but so utterly foreign to the character and habits of our people that they may be passed over without description. It is very certain that a community which has almost universally adopted the principle of plurality in elections for the sake of the speedy result, will not enter into an elaborate calculation of quotas and potter over the "distribution of the surplus," in order that the canvassing of votes may be theoretically fair and every minority exactly represented. What our people want is a legislature representing them fairly in the main, and composed of honest and able men; and whatever plan will secure this result is so far a salutary reform, even if not theoretically perfect. Indeed, Mr. Hare himself confesses in his last (third) edition, that "a perfect uniformity in the number of the quota of votes for every member" is "really important." This surrenders the whole point at issue.

If the proposition went no further than this, if every man throughout the State voted for his favorite candidate without regard to his place of residence, and the required number at the head of the list were declared elected, there would probably not be much more inequality than at present. A great disparity would, of course, exist between the number of votes received by the first on the list and the thirty-first; but so there is now between Mr. Ward's 17,000 votes and Mr. Morrissey's 9,000. An enormous vote for any candidate would, under this system, be only a natural, and, to a certain extent, proper tribute to his popularity. Still it would no doubt be wise to establish a definite *quota* which every successful candidate must obtain, as a security against the accident of persons elected by a mere handful of votes.

Supposing the principle once adopted, the details would be very easy to arrange. The most difficult point to decide would probably be the filling of vacancies, whether occurring by death or resignation, or by the failure of a sufficient number to obtain the quota. It would seem that in these cases the best way would be to let the legislature fill the vacancy, taking as candidates the two or three highest names left upon the list. Party organizations would find a legitimate and very useful sphere of action in assigning candidates to the voters of different localities, and thus preventing votes from being thrown away. It would be easy to calculate the number of members which each party in the State would probably be able to elect, and divide the State roughly into districts for these various candidates, taking due account of the natural and healthy local feeling. Most persons would, as a matter of course, vote for the candidate thus assigned, provided he were personally acceptable; but it would no longer be possible, as it is now, to force an unfit candidate upon an unwilling constituency. Such a candidate would be so sure to run behind his ticket, and fail of an election, that the committees would find it their only safe way to put up their best men.

Another way of preventing the loss of votes would be by letting the election continue ten days, as in England. This was suggested by Mr. J. T. Fisher, of Philadelphia, who proposed a plan for personal representation, independent of Mr. Hare, without Mr. Hare's favorite feature of endorsing a second choice upon the ballot, and distributing the surplus votes. At the end of the first day it would be ascertained that certain candidates were surely elected, and certain others in doubt, and the voters of the second day would cast their votes where they seemed most needed. Mr. Fisher's other proposition for meeting the same difficulty, by allowing successful candidates to assign their surplus to other candidates who fell short, can hardly be considered practicable or desirable. By the adoption of this principle we should secure the chief advantage which the English system possesses, of allowing the choice of non-resident representatives, and thus remove one of the greatest hindrances to the development of a superior order of public men. A member would no longer be afraid to offend local prejudices or go against the opinions of his district, and a man of weight and character might be reasonably sure of always finding a constituency to support him, scattered through the State, but able to unite upon their man, and make every vote count for him. Thus local feeling could still be gratified, but without depriving the State of the services of a valuable servant, as is now often done.

It has seemed most natural to speak of members of Congress, as these are the most important and prominent representatives elected by the people. The system can, however, be easily applied to any representative body or board of commissioners of sufficient importance to interest the mass of the people, as the Legislature of the State or the Common Council of the city. A board of aldermen, composed of a very small number, as proposed in The Nation of May 30, would be especially adapted to this mode of election. It may be remarked that, for a legislative body within the limits of a State or city, it might not be necessary to have any fixed number. There is no peculiar virtue in the number 120 or 240.

It cannot be expected, nor should it be desired, that so fundamental a reform as that proposed should be introduced at once upon a large scale solely in virtue of its apparent theoretical advantages. It seems as if an election held in this way could not fail to give us a vastly superior body of legislators to the present, while every portion of the community would be fairly represented. The Republicans of New York City and the Democrats of the western counties would now have their rightful share of power. No minority, indeed, not too small to be relatively insignificant, would need to be unrepresented, and no man of power would need to search for a constituency.

THE POLITICAL FUTURE IN ENGLAND.

Whatever course the House of Lords may take with regard to the Reform bill in the present session of Parliament, its passage, in the shape in which it has left the Commons, is now simply a question of months. It is folly to suppose that, in the present state of the public temper, and in the present position of the Upper House in the popular estimation, any restriction placed on the franchise by the peers alone will be submitted to. So that we may, in speculating on the political future of England during the next twenty years, safely consider the bill as passed. In fact, its fate has long ceased to occupy the minds either of its friends or its enemies. For nearly two months back the main subject of political discussion in England has been its probable effects on legislation, and on the constitution of Parliament.

As to the amount of the extension it will give to the suffrage, opinions vary. The highest estimate of the number of new voters it will create is 1,200,000; the lowest we have seen is 800,000, or more than double the number of voters under the law as it now is; and these new voters will, of course, be drawn from an entirely new class—and that the laboring class. It may seem at first sight as if this would amount to a complete transfer of political power to new hands; but the first effect will not be by any means so serious as this. The great towns will return very much the same class of men they now return, though probably the few Tories who still represent large boroughs will be dismissed—a result strikingly foreshadowed by the recent total defeat of the Conservatives in Coventry, naturally one of the most conservative towns in the kingdom. In the small boroughs the laboring classes will, we fear, for a while, vote as they now do in blind submission to the shopkeepers and landlords, or for such candidates as pay most money and furnish most and best beer on election day. In the counties the only class enfranchised by the new bill will be very small, and it is at present too much under the influence of the farmers and the great landholders to render any marked or sudden change in the county representation at all probable. Nevertheless, after making due allowance for all these things, there can be little question that even the first reformed Parliament elected under the new law will differ materially from the old one, if not in *personnel*, in spirit. It will be much more subservient to the popular will, much more progressive in its tendencies, much less enamored of the "ancient ways," much more chary about acquiescence in the old arguments against change, and much less confident of the value of the existing system in church and state. How great this change in spirit will be, even if there should be no change whatever in *personnel*, has been strikingly illustrated in the history of the Reform bill itself. The measure, when first introduced, was hardly a reform bill at all. It bristled with distinctions, restrictions, and precautions; but after it had been debated a week or two, and the real feeling of the members began to leak out, it became apparent that nobody had any real expectation that a great and radical change could any longer be resisted; and from that moment there was a race between the ministry and the majority in the direction of democracy, and the bill, when it was passed, established household suffrage pure and simple.

What, then, being thus changed, will the reformed Parliament do? Much that is good, but vastly less than most people on this side of the water expect. In estimating the rate of English progress, Americans nearly always leave out of sight the elements by which their own progress is least affected—such as habit and tradition—and yet few influences in England are more powerful. Logical legislation this generation will certainly not witness in England, no matter of what materials the House of Commons may be composed. Take, for instance, the distribution of landed property, on which so much of the peculiarities of English society depend; people here commonly expect that a reformed Parliament will make some very sweeping changes in this, or at least make such alterations in the law as will inaugurate sweeping changes. But this is because the majority of the public suppose that English estates are kept together by the law of primogeniture and a rigid system of entails. Even such a man as Senator Ferry, of Connecticut, showed, in his address before the Phi Beta Kappa Society at New Haven, last month, by the awful terms in which he spoke of English primogeniture, how little he knew of its working. The fact is, that the English law only enables a man to tie up his property one life longer than the law of New York, and that the law of primogeniture only affects real estate, and real estate only in cases of intestacy; so that, practically, we venture to say, a case of its application does not occur once in fifty years. In other words, the owner of real estate nearly always disposes of it by will, or dies without having the power to dispose of it at all, its descent being regulated by his marriage settlement. It is true that this settlement almost always secures it to the eldest son; but this is because families like this arrangement, and not because the law controls them. Most Englishmen prefer being "well-connected" poor devils to having a small share of their father's estate, and no "great house" at their backs, and this state of mind no legislation could change. The only thing the reformed Parliament could do to break up the great estates would be to compel an equal division of property at the death of the owner, as in France. But this is not likely to find favor in England any more than it would find favor here, as it would involve what would be to the Anglo-Saxon mind a very repulsive interference with the liberty of bequest. Moreover, it must not be forgotten that the way was prepared in France for the legal division of property amongst each generation by the fact that landed property was very minutely divided before the Revolution. Wendell Phillips, and large numbers of other well-informed persons, are under the impression that it was the Revolution which split up landed estates in France, but we showed, some weeks ago, that they were mistaken. The habit of division was well established at the Revolution, and the spectacle familiar, and there was, therefore, nothing shocking or novel in the provision of the Code which made it compulsory. One thing the reformed Parliament in England might, and no doubt will, do to promote the greater diffusion of property in land, and that is, to establish what Cobden called "free trade in land," by removing the legal obstacles to its transfer, such as the expense and difficulty of searching titles, the intricacy of the conveyancing laws, and the absence of a registry of deeds, all of which render the acquisition of land in small parcels almost impossible; or, in other words, the expenses of its sale are so great that it only pays to sell it wholesale. An assimilation of the English real estate law to that of this country would remove the whole difficulty without in the least affecting the security of existing titles.

As regards popular education, the reformed Parliament will probably very soon get rid of the obstacles which have hitherto prevented the establishment in England of any good system. The greatest of these obstacles has been the sectarian bigotry of the different religious denominations. The clergy of the Established Church have always violently opposed any state interference which promised to take the education of the children of their parishes out of their hands, on grounds with which everybody who has followed the educational controversy between the Catholics and the rest of the community in this country is familiar. The Dissenters, on the other hand, have

opposed all attempts to have schools provided for them by the state, because their war against the Church establishment has committed them to a thorough support of the voluntary system in everything, and to thorough hostility to all Government aid. The result is that the state connection with popular education is restricted to the distribution of a small sum of money amongst the different denominations, and the exercise of a modified supervision of the teachers; and it is hardly necessary to say that there is in England no system of popular education, and that the bulk of the population is brutally ignorant. The new popular element to be introduced into the government by the Reform bill will, it is certain, not be affected either by the Episcopalian or Dissenting scruples, and will probably before long establish a system of free schools at state cost, and, we venture to predict also, will couple with it compulsory education.

The Irish Church Establishment will probably be amongst the first of the great abuses to go by the board, but mainly because it has few friends in England who support it for any better reason than because they fear the effect of its fate on the Church Establishment in England. It is true that the great argument now used by the enemies of the Irish Church is that it is the church of the minority—and this argument will probably be the one most effectual in bringing about its overthrow—and the Church of England is not the church of the minority; but then if the theory of the right of the state to interfere with church property—which English Churchmen strongly deny—be once not only asserted but put into practice in Ireland, the friends of the English Church fear that its application to it also would not be very long delayed. Neither the High Churchmen, however, nor yet the owners of church livings, are a sufficiently powerful body, politically, to make their opposition of much avail in a case in which they cannot allege their own interests to be directly concerned. Moreover, the breach between the two great parties in the English Church is becoming every day wider and wider, and it is safe to say that it is wide enough already to make united action on any great ecclesiastical question hereafter impossible.

In the army the sale of commissions, and with it the whole system of aristocratic officering, will probably be abolished at a very early period, and with them the "Horse Guards," which is simply a contrivance for exempting a large portion of the military administration from the control of Parliament, and keeping it in the hands of the crown. The commander-in-chief, an irresponsible appointee of the crown, presides at the "Horse Guards," and keeps the aristocratic interest in the military machine under his care, while the Minister of War, to whom the working-details—the feeding, the clothing, and so forth—fall, and who is answerable to the House of Commons, finds his way blocked at every step by the prejudices and tastes of "good society" acting through the Horse Guards or the "illustrious duke," as it is the custom to call the Duke of Cambridge, the commander-in-chief.

These striking features of the old conservative system changed, it is not, we venture to say, likely that the reformed Parliament will go much further in the direction of uprooting. In the imperial policy—properly so called—with its large navy, multitudinous foreign colonies and posts, and its great Indian empire, no great change is likely to come from the radicals any more than from the conservatives. The ear of the English workman still loves, full as well as, and even better than, the ear of the lord, to hear the roll of the imperial drum following the course of the sun round the globe. The aristocrat draws his claims to consideration from other sources than the national power and strength, but the working-man draws his from the fact that he is the citizen of a great empire. The most marked tendency of the new régime will, in our opinion, be in the direction of greater governmental interference, or, in other words, in the direction of construction or organization rather than of destruction or removal. The *laissez-faire* policy—in everything but trade—seems to have spent its force in most of the free countries of the world. It was due to a natural popular reaction against the excessive government of the aristocratic and monarchical systems of the seventeenth and eighteenth centuries; but now that the people are everywhere more or less in control of their own affairs, there is a strong leaning once more in the direction of governmental help or interference. The Government is being urged to take possession of the railroads, of the telegraphs, as well as of the post-office; to supply schools, as it is supplying savings-banks in England; and to take legislative precautions against overwork on behalf of adults, as it has already taken on behalf of children. How far this tendency will carry us it is hard to say; but if it be not accompanied by a great increase of education, and particularly of politico-economical education, and a great improvement in the character of the periodical press, the world will probably, fifty years hence, be filled with as many complaints of the pestilent meddling of the majority as it has been during the last fifty years of the pestilent meddling of kings and nobles. In other words, nothing but knowledge will ever save individual freedom from the perils by which it is, under every system of government, surrounded.

HINTS FOR CONSTITUTION MAKERS.

BY A JUDGE.

I. — The Instrument.

A constitutional convention I should define to be "a lawful revolution." Generally revolutions and conventions do not come without immediate and pressing causes and without a clear idea of wrongs to be righted and remedies to be applied. But in the present instance the convention which may overthrow the old and establish a new government was called twenty years ago, and while the citizens of the State are agreed that the present organic law is often defective and sometimes wrong, that our constitutional system is weak, and, in common phrase, "has worked badly," there is an extraordinary dearth of opinion as to what should or can be done. When the people leave such questions wholly to their delegates, they may be assured that their delegates will act feebly.

The first measure of reform may be in the instrument itself. When the great Convention of 1787 framed the Constitution of the United States, they cared sufficiently for language and form to appoint a committee on style. Whatever differences of opinion the Constitution of the United States may have occasioned, few have arisen from the obscurity of its language. A beautiful simplicity and clearness run through every article and section, so that the farmer, the mechanic, or even the upper class of the public school, rarely doubts as to what the Constitution means. The present constitution of New York is neither clear nor simple nor concise. Its style indicates many and different workmen. It has that excess and jumble of words which is the usual earmark of an ill-considered statute. Comparing it with the Constitution of the United States, a stranger would infer that civilization had gone backward.

But apart from form and language, the present constitution contains a mass of errors which, it is to be desired, though hardly hoped, the convention will eradicate. If there be any constitutional lesson taught by the last twenty years within this State, and by the last seven years throughout the country, it is the worthlessness of those paper bulwarks which are called constitutional restrictions. Has there been any great measure of reform under either government which the constitution has not been invoked to prevent? Has there been one instance of error where the constitution has restrained and controlled the turbulent and unscrupulous of either party? Has it not always been appealed to by the worst part of the political community rather than the best? Have we not turned our faith into idolatry, and allowed the question of constitutionality to expand into a superstition? Look at the solemn farce just played in Washington, wherein nine respectable gentlemen and most learned judges have been solemnly pressed to control the army and navy of the United States and to enjoin a great nation from making its own laws. Look at the city of New York, where for the last ten years hardly an act of the Legislature has been allowed to take effect until it has been approved by five temporary, constantly changing, and politically elected judges! If any man supposes that these decisions upon political (using that word in its higher sense) subjects are legal and not political, he must have shut his eyes to the whole history of our constitutional law. Hardly was the ink dry upon the present State constitution when the constitutionality of the canal loan came before the Court of Appeals. It was argued at great length, it was carefully weighed and considered, it was conscientiously and solemnly decided. And what was the result? That the seven judges trained in one political school voted one way, and the one judge, trained in another political school, voted the other way, and that each side of the court rendered reasons absolutely conclusive to the two political schools whose scholars they were. It was so in the Dred Scott case; it was so in the recent test-oath case; it has been so in every case where the point to be determined is political and not legal. The questions might as well have been referred to a board of surgeons, and, under like political conditions, they would have been decided with precisely the same result and by precisely the same votes.

Yet this is not the chief evil. When a nation abandons the guardianship of its constitution to the judiciary, the people insensibly grow indifferent to and then restive under its obligations. In this State, where the judiciary have gradually assumed a final veto power, the evil has become painfully apparent. There has been a steadily increas-

ing effort on the part of the people to evade and cheat this constitution which was ordained and established for their protection. And in this game of evasion, the bad and the unscrupulous ever excel. If we place in the one scale the benefits derived from these special restrictions, and in the other the host of unworthy subterfuges and the immense mass of litigation which these same constitutional restrictions have produced, it is not every one who will be ready to say that we have not lost more than we have gained.

The Constitution of the United States, apart from the amendments, contains little more than a frame of government and a few safeguards for civil rights. Remembering that it is not made for one government, but for many, and that it establishes, and defines, and rules at least two ever-conflicting powers—the General Government and the several States—it is marvellously free from minor particularities and restraints. Were it constructed on the system of petty restrictions which is the system of the State constitution, there would be no end to the constitutional cases arising, and no one court would be able to decide them, though it sat through the three hundred and sixty-five days of the year. Yet even the Constitution of the United States has thrown upon the judicial department the entire responsibility of protecting the Constitution. This responsibility the judiciary is least able to bear, and its errors are the most difficult to be corrected. The body of the people, moreover, have instinctively known that these political decisions were political, and not legal; and while upon matters of law the Supreme Court of the United States has ever been heard with profound and undoubting respect, its decisions upon matters of political power have been received with constantly growing contempt; so that if things go on as they are going, no distant day will see an amendment adopted cutting down the powers of that tribunal, and declaring that no statute properly enacted by the people through their lawful representatives shall ever be adjudged unconstitutional and void. Sooner or later the people of the United States must learn that there are no real constitutional safeguards beyond their own integrity, and that neither written constitutions nor an independent judiciary can guard their liberties or maintain their rights.

Amid these constant conflicts which are ever denying to American legislatures ordinary legislative powers—indeed, I may go further, and say, which are ever denying to the American people the right to make their own laws through their own lawful representatives—it is refreshing to look across the water and see an unwritten constitution jealously guarded and maintained by its natural guardians, the people and the parliament. It is a relief to take up the English law reports, and find them unladen with the cumbrous heading, "Constitutional Law," and to learn from them that at least one people have been able to preserve their constitution and to trust themselves. There is but one power which can maintain a constitution, and that is the power which ordains and establishes it—the people. If that power fails, written instruments, and pledges, and judicial guardians, and all other supports must go down with it. Whatever inventions come between the people and this their proper responsibility tend only to weaken and destroy the constitution. That responsibility cannot be transferred to any delegated authorities, be they ever so learned, upright, or just. The question of constitutional infringement upon all political subjects must be fought out by the people themselves, and they, feeling the obligation which is upon them, must look always with jealous eyes upon their representatives, nor seek to evade a responsibility which no one else can really bear. Should our present system continue twenty years more, and move on as it has been moving, one may well doubt whether the judiciary will not become the supreme power of the State, or whether a law will be regarded as morally binding until it has been approved by this council of revision. If the Convention of 1867 does no other work, let it at least leave the people of this State hereafter free to make their own laws.

SOUTHERNERS AFTER THE YANKEES HAVE WITHDRAWN.

WHAT ARE THEY?

After the troops are withdrawn, after the States are once more in the Union, after the authority of local law and local opinion is re-established, what will the Southerners do? To answer this question with even a probable guess, we must look a little to see what they are.

To a stranger, the most striking feature of the Southern character is its provincialism, its want of nationality, as exhibited in its strong local affections and prejudices and in its deficiency of information concerning whatever is beyond its geographical limits. A good Southerner is first for his district, then for his State, and lastly (if at all) for the Union. A good Southerner of the average culture is as much surprised to see a well-bred, honest, courageous Yankee, as a dog would be to see a cat whom he felt bound to respect. A wealthy South Carolina farmer, introducing a Northern officer, who had won his approval, to a friend, did it with the recommendation, "Now and then, Smith" (here a patronizing slap on the military shoulder)—'now and then you see an *honest* Yankee." Another officer, having confessed that he was born in Connecticut, has been comforted with the pitying remark, "Well, I've understood that the Connecticut people *ain't* so powerful bad." Another has been afflicted with the compliment, "Sir, we are not accustomed to see men of your character and intelligence from your section of country."

Natives of every Northern State have marched by armies over every Southern State, and still it is the common belief at the South that the Union soldiers were mainly Irish and Germans. To the statement that in the ratio of battle mortality per thousand of men furnished, Massachusetts ranks third among the Northern States, an intelligent Georgian replied, "I suppose that that was because the Massachusetts troops were principally foreigners." Four years of war, many defeats, conquest, have hardly shaken the old belief that "Yankees can't fight."

The Sand-hillers who applied to the United States commissary at Columbia for food to save them from starvation, addressed him respectfully as "the enemy." Many a Bureau officer engaged in distributing rations has heard the Northern States referred to as "those foreign States."

This provincialism is minute in its subdivisions. The low-country people of South Carolina look upon the up-country people with contempt; and the feeling is reciprocated with a mixture of three parts contempt and one part anger. The mountaineers of the Dark Corner view the fat farmers on the slopes beneath them as proper subjects for black-mail, and the farmers retorted during the war by seeing that the mountaineers were well hunted with rifles and bloodhounds. Representative men of Black Hill County dare not venture, except by night, into Red Bottom County, for fear of being bushwhacked. When the Unionists get control of any district, their first vague idea is to "clear out the rebs," so as to have all the neighborhood comfortably alike. Meanwhile the rebs watch their leaguer acquaintance with angry eyes, and would be very apt to "hunt them" but for the garrisons.

It is not only a land of prejudices, but a land of pugnacity. Great there is the man who will fight, and greatest of all is the man who whips. We have heard a Southern attorney-general talk with enthusiasm of the old militia trainings, where "there would be more than thirty fights in a day, sir, and ever so many broken heads, and all good friends as soon as it was over." When Brooks beat Sumner senseless in reply to a rhetorical philippic, nine Southerners out of ten thought that he had triumphantly closed the discussion. Almost any cause is sufficient to justify blows or pistol-shots. "If I should kick another man's dog," said a respectable South Carolinian, "I should expect to have a fight on my hands." "If my cousin should call my brother a liar," said a charming and religious Virginian lady, "of course my brother would be bound to shoot him."

It is just to say that along with its old-time vices this population has its old-time virtues. It is impulsive in kindness as in violence; it is ardent, it is generous, it is heroic. Bankrupt planters who are at the last crust will share it with grey-headed negroes who cared for them in childhood. Within three miles of Pickens Rigdon, the drunken and brutal bushwhacker, lives Calhoun Burden, the magistrate, who cannot see it his duty to arrest Jim, but who will haul corn thirty miles in his own wagon for the poor of his beat, and will issue every pound of it scrupulously, although he is not sure of feeding his own family until harvest. The multitudinous paupers of the South—the aged negroes, the widows and orphans of the war, and even those worthless vagabonds "the low-down whites"—are mainly supported by the charities of people who are living to a great extent on corn-cake and bacon. It is curious to see the finest flowers of humanity flourishing amid its coarsest weeds. Under favorable circumstances, the South can furnish more Washingtons and more Lincolns.

Hitherto we have looked at the Southerners in the mass; we have surveyed them through a rough and compendious average; we have seen them somewhat as they were. But to understand their present condition we must inspect four large classes which are sure to play important parts in the immediate future. We must consider the old oligarchy, the white Union men, the negroes, and the moderate Southerners.

The old oligarchy comprehends the once great planting families, the bygone political magnates, the leading merchants and professional men. Being aristocratic, it is of course supported by every Southern female who has any pretensions to position, including Governor Perry and the "lovely woman" who wrote him a letter. This class, reinforced by the bomb-proof heroes, and a considerable number of boys who did not fight, and deducting a number of its own who did fight and thereby learned wisdom, constitutes the two million "implacable rebels" of *The Tribune*. Its social influence, notwithstanding its political disabilities, is enormous. The bourgeoisie, the cross-road storekeepers, the farmers, and the poor whites, although secretly doubtful of its wisdom, do not quite like to say so. It heads the non intercourse movement; it makes it "bad style" to know a Yankee or an officer.

It has a horror of the national flag, and smiles on those who refuse to salute it. When ordered to show the stars and stripes from the public buildings on the national holiday, it says half sneeringly, half tearfully, "I *used* to believe that the brave were magnanimous." It is antiquated, hopelessly prejudiced, vindictive, treasonable. We rejoice that it is to a considerable extent debarred from taking part in politics during the process of reconstruction.

Of the Union men, nine-tenths are small farmers who can barely write, or poor whites who cannot read. Mountaineers in large part, they were loyal during the war very much out of hostility to the lowlanders; and they are too much governed now by the vote-yourself-a-farm sentiment and by projects of personal vengeance. Ignorant, unaccustomed to political action, blinded by that hate which is so characteristic of Southern dissension, they will not weaken their enemy by accepting any considerable number of deserters from his ranks. Their uncultured chiefs are jealous of the accession of a man of wealth and capacity, fearing lest he should usurp the leadership. They have no adequate conception of the difficulty and grandeur of the task before them. Inconceivably local in their knowledge and ideas, their plans usually cover only their special neighborhood, and they will be jubilant if their county goes Union though all the rest of the State goes copperhead. Nevertheless, aided by the immense negro vote, they will probably carry several Southern States for the Republicans, at least once. Whether they can obtain a lasting victory without wider views and a more liberal acceptance of penitent rebels, is very doubtful.

The negro! The Sphynx! He has never spoken except in riddles which no man has understood. He is hard pressed now for corn and bacon, and is cautious about talking politics to his employer. When you have asked him if he belongs to the Union League, and he has told you "No," you are less informed in the matter than you were before. Where the mountaineer or the Northern "emissary" cannot instruct him by word of mouth, he may vote for his old master as being the best man he knows. But at heart he is a Republican; he is sure that Congress is his friend; he will support it if he knows how; he believes in Yankees. Perhaps the most hopeful sign in him is that he is crazy to have his children go to school.

The moderate Southerners—millions strong, and the most attractive portion of the Southern people—are, in general, the old Confederate soldiers, well represented always by Lee, Johnson, and Longstreet. The sentiment of the Northern soldier inclines toward these men, and he would fain clasp hands with them in a new patriotic compact. They are somewhat bewildered; they are a little bullied and humbugged by the old aristocracy; they feel as if Congress were unnecessarily suspicious of them; they are disheartened by the inhospitality of the Union Leagues; but in general they bear their troubles and await their fate nobly, and confidence in them would be well bestowed. It seems paradoxical—it would be contrary to all received custom—but still it would be wise to enfranchise and enable for office all men who fought under the Confederate flag.

Such is a rapid, broadly drawn, and, of course, imperfect view of what the Southerners are. We are now ready to enquire,

WHAT WILL THEY DO?

Ah, yes! good heavens! and what won't they do? what have n't they done? If we can predict the future from the past, it will be sensational. After the Southern representatives are in Congress, their constituents will still furnish Wendell Phillips with plenty of texts.

Of what will happen in the reconstructed States during the first years of that millennium we can probably form a fair idea from what is now going on in some of the so-called Border States. Where the Unionists carry the elections, it will be Tennessee; where the Democrats hold the ballot-boxes, it will be Kentucky. If the leaguers get the victory in Boone County, they will want all the rebs to remove to Big Lick County, "whar they belong"—the latter having gone solid for the candidate of the old-line Democracy. The South will have as many riots and rencontres as the North, not merely in proportion to the population, but in proportion to the number of square miles, Alabama will still be troubled with intermittent desires to banish *Harper's Weekly*, and *The Charleston Courier* will occasionally warn Southern booksellers not to pollute their shelves with Yankee novels.

As in other lands, bad citizens as well as good ones will obtain office. John Morrissey, the sterling Democrat from our commercial emporium, will play into the hand of Major Simon Suggs, the heretofore bushwhacker of Eastern Texas; while P. T. Barnum, if then a member, will make a happy family with that lately reconstructed but fervent Unionist, the Hon. Christopher Sly, of New Orleans. There will be silly efforts toward reaction, and rough, blundering pushes toward progress. In demagogism, appeals to local prejudice, and election trickeries, the representatives of the old oligarchy will vie successfully with the rougher leaders of the Republicans. It will be an era of confusion, and will seem to be an era of demoralization, and yet it will glow with real progress, because all men will be equal before the law, and speech will be free.

An urgent question is, Whether the spirit of reaction—the spirit which hates Yankees, and keeps down niggers, and runs off Union men—will not, within two years, recover possession of the South? Without the colored vote, it might; with that, it probably will not. It must be remembered that the ordinary Southerner does not know that he is prejudiced, and that he has not been able in a few months to shed the beliefs and passions of a lifetime. He has given up secession because he has learned that he cannot have it; and slavery, because he has seen it to be a source of poverty and weakness. But he still holds himself to be the man of men—the most eloquent, the most generous, the most chivalrous, the bravest—miles above Yankees, and separated by an impassable gulf from niggers. He believes as firmly as the Irish Democracy that this is a white man's government, and that it is wrong to let black men vote in it. He looks upon the Abolitionists as indisputably malignant fanatics, and upon the Republican party as a sink of selfishness, despotism, and iniquity. He has no other idea of the present Congress than that it is a pack of swindling and tyrannical demagogues. Such are the honest opinions of at least three white Southerners out of four.

At present the Southerner is quiet under what he regards as monstrous oppression and unconstitutional injustice. Why? Because he has been beaten, because he is struggling for bread, because he has learned that resistance only makes the yoke heavier, and because the garrison is within summons. Moreover, he has been accustomed to obey illegal power. The orders of the commandant of the post, or of the officer of the Freedmen's Bureau, are no more extra-civic than were the directions of the bygone political juntas who saw that slavery received no injury on the visits of Jeff. Davis's recruiting parties. The file of soldiers does not seem an unbearable messenger of authority to men who have been called on by the vigilance committee and the agent of the conscription bureau. Yes, the Southerner is very quiet and obedient, especially since the passage of the military bill. A man in blue uniform, or a United States civil agent, can impose on him to almost any extent. The lonely bureau lieutenant, without a garrison or even an orderly, rules peacefully over a region as large as Rhode Island or Connecticut; and at his summons a planter—once perhaps owner of a hundred negroes or colonel of a Confederate regiment—drives thirty miles to explain the alleged violation of a contract. This planter has even come to look askance upon his declared but injudicious friend, President Johnson, and to wish that he would hold his unlucky tongue. His whole political mind is set upon the one idea of getting back into the Union, careless how it is done provided he saves his land and that vague possession which he calls his honor. No people could be more patient under a military government than is the Southern people. But when this despotism is gone, will not the old one return? When the file of soldiers has sailed for Behring Strait, shall we not again see the vigilance committee?

Last summer many Southerners who wished to accept the constitutional amendment were hushed by the stares of the political grandees, or by the friendly whisper, "If you don't look out, you will get yourself run off." The reactionary party trusted that the President would run off the "Rump;" that at all events he would triumph in the summer and fall elections; that he would restore the South, with its negroes all represented and none of them voters; then unite with the Northern Democrats and rule Congress; pass this, repeal that, and repudiate the other; at home, apprentice the niggers. The reactionaries did not talk aloud, but they whispered hope and authority. The victory of Congress was a terrible blow to this conceited and stupid and malignant party. The enfranchisement of the negro has probably ruined it, and so has perhaps saved us from a new insurrection within twenty years. We assert positively that, before this fact of colored suffrage was accomplished, the South was full of small whisperings that the lost cause might be regained, and that now these whisperings have died out in despair.

Yes, hereafter that bane of the republic, a united South, is impossible. If Red Bottom County is sternly Democratic, that is to say, reactionary, Black Hill County, its next neighbor, will act as a counterpoise by being fiercely Republican, and thus liberty of speech and conscience will have a foothold. But, as in Tennessee and Kentucky, there will be throughout the South some anger and vengeance in their dissensions. The poor and uncultured mountaineers, who were hunted as deserters during the war, will long to confiscate the lands of their old persecutors, even if they do not themselves receive an acre. The old aristocracy will not easily give up its habits of physical domination, and leading Republicans will be marked out for mob law as dangerous agitators. Between the whites and blacks

there will be no war of races; but there will be much misunderstanding and bickering. To the negro as a nigger, that is, as a humble dependant, the Southerner is friendly and even kindly; but to the negro as a voter, a juror, a man, he is at heart more unreconciled than a New York Fenian or a Connecticut Democrat. In multitudes of single scrimmages, and in more than one compendious riot, this feeling will be expressed as an Irishman would express it; for in his self-control, his cold-blooded rationality, and his lack of pugnacity, the white American of the South is wonderfully like the child of Green Erin. The Bureau officer, if he then exist, will no longer perform his duties in tranquillity. Legal obstructions will be thrown in his way; his Yankee soul will be damned to his face from time to time; he will be tormented into forwarding his resignation. And long, among the genteel, will be the sway of the non-intercourse idea. The Yankee will be desired as a capitalist and business manager, but evaded as a member of society. He will have to cast in his lot with the plebeian Republicans and share their unfashionable dishonor, certain that no amount of copperheadism and fawning will make amends for the unhappy accident of his birth. Here and there a woman of the brahminical race will marry him, and that woman will be converted, but not her companions.

And yet the state of things will not be intolerable either to bear or to witness. It will be incomparably better than what we endured for those ten or fifteen years during which no Northern man at the South dared say that his soul was his own. There will be a vigorous germ of progress and betterment in it, instead of a dominating barbarism growing more potent day by day. Amid many fisticuffings, and some riots and some bushwhackings, liberty of speech and belief will generally flourish, and will steadily increase. Governor Perry (let us do him justice) will still be the advocate of venerable law, and vindicate the smallest and most oppressed party, whatever it may be. The superior men of the South will accept the new régime, and will struggle with more or less success to humanize it. The social hostility will slowly perish. Parties will become national. The united South having gone to its grave, the united North will happily follow it. The manufacturers of the Carolinas will make common cause with the manufacturers of Massachusetts and the wool-growers of Illinois. Men of all States will turn their attention from moral to financial questions, and will forget to charge each other with being "mischievous fanatics" or "the sum of all villanies." The solidarity of the nation, the fact that one section cannot be oppressed without more or less damaging every other, will become an axiom of national politics. And with the recognition of this physical unity will arrive a sufficient intellectual and sentimental unity.

While this change is slowly working in the reconstructed States, the North, it is to be hoped, will let progress flow within its re-established legal channels. After South Carolina is in the Union, we must pass no statutes which apply to it any more than to New York or Illinois. We shall be greatly tempted to interfere; we shall want to amend the Constitution at every session. We have got into an exclusive habit of criticising and correcting and governing the South, considering its misdeeds as more important in the sight of Heaven than our own. We are in danger of being insupportable Pharisees because we have known this poor publican.

Is it not time for that greatest of revivalists, Wendell Phillips, to tell us of our own sins, instead of dwelling so gratefully on the sins of others? Why will he not begin such a preaching at the South? He would be listened to with respectful attention, because the Southerners adore great orators, and have a regard for enemies of the first magnitude. If anybody shoots at him in memory of old times, it will be some bomb-proof hero who will be sure to aim badly. Probably he will be perfectly safe; yes, even if he should rehearse all his old speeches, he will be safe; and if not, what of it? He will certainly be less threatened and assaulted than he was fifteen years ago in that North which is now a model of obedience to law, and a teacher of toleration. Seeing this he may hope of the Southerners, and judge them worthy of joining him in an ethical crusade against the slatternly morality which nominates Barnum in Connecticut, and elects Morrissey in New York, and endures the New Jersey railroads.

ENGLAND.

LONDON, July 26, 1867.

WE have made another step in the Reform bill since I last wrote to you. It is the last step of any considerable interest, and it is the one which, without the least spirit of prophecy, I told you would be taken when I wrote to you a month ago. The House of Lords has passed the second reading of the bill without a division, and will reserve it for alterations of detail. I do not believe it will venture upon any really important ones. The debate on the occasion was a very good one, though it contained far too much discussion as to the merits and demerits of the two parties who have hatched the bill between them to be of general and permanent interest. Lord Cairns, who was the first of the three Attorneys-General whom the Conservatives have appointed in the course of their year's tenure of office, made, perhaps, the best speech that was made. He certainly had the satisfaction, if such it was, of proving conclusively that there really was no choice about passing the bill, and that when you were about it there was no use in making two or more bites of a cherry. No one has shown much statesmanship or anything to call courage, and the Conservatives have shown an utter want of principle and consistency which I think will, in no long time, destroy their credit with the public at large—not that it would take much to do that.

We shall have a quiet year after all this excitement, I fancy. There are questions of detail, and especially the question of settling the boundaries of the new boroughs, to be arranged before Parliament can be dissolved, and, of course, the present government will not dissolve Parliament a day before they are obliged to do so. I think, therefore, that 1868 will be a year of peace, and that we shall not have to try the temper of our new tool till 1869. It is like to a short halt on an odd journey. I am not very old, but I well remember when the name of Chartist was a word of terror, and when educated men would have shrunk with horror, for the most part, from the charge of holding Chartist opinions. Yet, of the five points of the charter—universal suffrage, annual parliaments, vote by ballot, no property qualifications for members, and equal electoral districts—one, the abolition of property qualifications, has been carried unconditionally, and almost without notice and without result; one, the most important of all, universal suffrage, is obviously only a question of time; one, equal electoral districts, is also a result to which we are gradually approximating in a more or less blundering and unsettled way; and the other two, the ballot and annual parliaments, are coming to be regarded as unimportant, principally because of the triumph of the principles to which they were intended to act as safeguards. So much for the Reform bill. If I wrote for ever about it, I could add very little to the two old proverbs, "Needs must when the devil drives," and "Don't look a gift-horse (it should be a white elephant, perhaps) in the mouth." Many people, if honest, would add a third, "Grin and bear it."

For the last few weeks we have all been in a state of unusual display and hospitality. Such a piece of work as there was with the Sultan and the Viceroy of Egypt I have seldom seen. There was volunteering. There was a great naval review, or, rather, an attempt at one, which was frustrated by the bad weather; for St. Swithin was terribly out of temper this year, and protested against being buried at Winchester in the most emphatic manner by keeping up continual rain and squalls for a fortnight together—as if anybody wanted to meddle with the irritable old creature! There was to have been a grand review in Hyde Park, which was put a stop to by your friend Juarez's exploit in the matter of Maximilian. There was a banquet at the India House, and another at the Guildhall, to our illustrious guests; and, as if that was not enough, we have been invaded by a good many hundred Belgian volunteers, who came over to see our shooting at Wimbledon, and to express general philanthropic sentiments. I have seen few things so odd as the enthusiasm excited by the Belgians. I do not exactly know why anybody should care very much about them; but the whole nation was disposed to be vivacious. They were received with enthusiasm in every direction, even in parts of the country where it seemed odd that any one should know anything about them. I happened to be at Derby when a party of them marched into the town to look about them, and amongst other things to go to luncheon at Chatsworth, the Duke of Devonshire's palace. There was a regiment of volunteers drawn out; there were endless Belgian banners in every window; half the population descended into the streets and got to high jinks with each other, catching every one's hat off his head and chucking it about till it fell to pieces, like so many school-boys. I should guess there were about thirty Belgians in all, and they were cheered, had their hands almost shaken off, were speechified, feasted, and walked about the streets arm-in-arm with the volunteers, till I thought their heads must fairly swim. I wonder some of your volunteer regiments don't come over here to the next Wimbledon meeting. If they did, I believe you would be received with an ecstatic kind of welcome which would give you the notion that love of Americans was the most powerful of all English passions. I hope we may be good friends, and a great deal of this sort of thing is perfectly genuine; but I own it appears to me that our present temper is such that, if a deputation came to fraternize with us from the dullest town in Central Germany, or from an outlying part of Spain, we should suddenly discover that we loved them dearly, and that their history was one standing continuous illustration of all the great principles of, etc., etc., etc. I hope we are not such fools as we sometimes look; but I really would not like to be sure. We managed

our hospitalities better than might have been expected. The India House feast was splendid, and the same may be said of the dinner at the Mansion House. I believe—for I only read about them in the papers—that there was terrible quarrelling about the chief performance of all.

One of our latest developments is a taste for grumbling at the Queen. No doubt, since Prince Albert's death, she has lived principally in retirement, and has altogether given up her position as a court leader, which, according to the old theories on the subject, it is one of the principal duties of a sovereign to perform. How far this is a fault—how far it is a misfortune, I do not pretend to know. It has been said, with an appearance of authority, that the Queen's health is such that she cannot stand the excitement of receptions and society; but be this how it may, poor lady, she gets lectured up hill and down dale by her affectionate subjects in a manner which, I must say, seems all the harder because it is all done in terms of the most profound respect and sentimental loyalty. *The Times* and *The Saturday Review* are constantly taking opportunities to let her know, in a pleasant way which is peculiar to them both, that she is not up to her work; that she does not earn her wages; that she is throwing off the mask and destroying the illusions connected with her position in a most imprudent manner; that, as she is a mere idol and sham, she ought, at least, to be a graceful idol and plausible sham. This, of course, is a free translation; but I really do believe that this is the fair net meaning of some of the articles which have lately been published in terms of the most orthodox and devoted loyalty. Besides this remarkable development, there has been of late an outbreak of a much coarser kind of anti-regal talk, of which I will only say, that I wish with all my heart that the blackguards and blackguardesses who propagate it in various walks of life could be put in the pillory and get as many rotten eggs as they deserve. I have no reason to believe that there is any foundation for their stupid and cruel gossip about various members of the royal family; but there has always been a certain gentle current of lying on such topics running through the world, which every now and then swells and becomes unusually noisy for a short time and then subsides again. Just at present one of its freshets is going on.

Very little has been stirring of late in the literary world. I seldom, indeed, remember a duller year in that line. There are, however, one or two noticeable books brought out, besides the usual crop of articles of commerce made to sell. The best new book I have read for some time is Mr. George Lewes's "History of Philosophy." It deserves to be regarded as a new book, though it professes to be no more than a new edition of an old one published in 1844 or 1845—a much similar performance indeed to a biographical history of philosophy. The new edition is in substance a new and very elaborate book. It consists, first, of prolegomena, giving Mr. Lewes's own views on philosophical subjects, and, next, of two ample volumes, of which the first traces the history of ancient, and the second that of modern, philosophy. The old plan of the original work is so far preserved that each volume consists of reviews of systems founded upon more or less careful biographies of their authors. The first article is on Thales, and the last on Comte, towards whom Mr. Lewes stands in the attitude of a disciple. He is not, however, a thorough-going disciple, as he agrees with what you would call that wing of the Comtist party which believes in their leader's philosophy while it repels his religion and his polity. Towards those later developments of the one philosopher whom he owns as a master Mr. Lewes occupies, as he tells us, the position of a respectful heretic. I believe, by the way, that of the five or six people who, more or less, profess the religion of Comte, all but two are heretics, and whether they agree upon all points I am not quite sure. The main object of Mr. Lewes's book is to explode all ontology. He regards the attempt to arrive at any higher or other knowledge than that which is composed of a classification of the impressions of the senses as an attempt to jump off our own shadows, and this he not unnaturally regards as an injudicious way of employing time and thought. It is very interesting to follow the steps by which he tries to make out his proposition. His method is to give a summary of the principal opinions which have been advanced by the different schools of philosophy, to show how they all attempted by various devices to grapple with the same difficulties in different ways, and how every such attempt was defeated by the difficulties which it vainly tried to conquer. His moral is, that we ought to desist from a struggle in which no victory is possible, and to address ourselves to the object of arranging our real knowledge, the information which we derive from our senses to the world without and to the world within. Neither the lesson nor the moral is very new, but the way in which the lesson is taught is most remarkable. In clearness, in vivacity, and, above all, in perfect candor, and quiet, cheerful good taste and good sense, Mr. Lewes's book leaves hardly anything to be desired. I do not think he has been sufficiently appreciated in this country, and I hope he will be so appreciated in America. He did not enter the list of learned men by the orthodox road. He was neither at Oxford nor at Cambridge, and he has written a number of comparatively slight performances in periodicals and elsewhere, hence his solid merits have been greatly underrated. Yet his "Life of Goethe," his work on Aristotle, and his "History of Philosophy" are far better and more considerable works than many which support much wider-spread reputations.

DR. PETERS'S NOTES ON CHOLERA.

SECOND EDITION OF

NOTES ON THE ORIGIN, NATURE, PREVENTION, AND TREATMENT OF

ASIATIC CHOLERA.

By JOHN C. PETERS, M.D.

1 vol. 12mo, cloth.....$1 50.

THIS DAY PUBLISHED BY

D. VAN NOSTRAND,

192 Broadway.

*** Copies sent free by mail on receipt of price.

A NEW AND VALUABLE WORK.

JUST PUBLISHED:

The Principles and Practice of Disinfection.

By ROBERTS BARTHOLOW, M.D.,

Professor of Materia Medica and Therapeutics in the Medical College of Ohio, etc.

1 vol. 16mo, cloth.....$1.

This valuable little work is written in a plain and readable style, and contains full information on the important topic which it treats, while the author's high standing as a physician gives his opinions weight and authority in the medical profession.

Sent by mail, post-paid, on receipt of price.
For sale by booksellers generally.

R. W. CARROLL & CO.,

PUBLISHERS,

117 West Fourth St., Cincinnati, Ohio.

The California Teacher:

A MONTHLY JOURNAL OF

SCHOOL AND HOME EDUCATION;

Official Organ of the Departments of Public Instruction in the States of California and Nevada.

RESIDENT EDITORS, SAN FRANCISCO:

JOHN SWETT, JOHN C. PELTON, SAMUEL I. C. SWEZEY.

TERMS: $1 50, coin, or $2 currency per year.
Volume V. commenced with the number for July.

The general circulation of THE TEACHER among teachers and school officers makes it a most desirable advertising medium, both for Eastern and home publishers, and other business men. It is the only journal that enters every town and every school district in the States of California and Nevada. The new volume commences with an assured circulation of nearly twenty-five hundred copies, and will probably exceed three thousand before the end of this year. No advertisement counted less than half a page. Yearly advertisers have the privilege of changing four times per year.

Address all communications and remittances: "CALIFORNIA TEACHER, Box 1,977, San Francisco, Cal."

RATES OF ADVERTISING.

One page: One Month, $12; Three Months, $30; Six Months, $55; One Year, $100.

Two pages: One Month, $20; Three Months, $50; Six Months, $80; One Year, $150.

One-half page: One Month, $7; Three Months, $20; Six Months, $35; One Year, $60.

Harvard Memorial Biographies.

2 vols. crown 8vo, price $4.

In order to place this valuable and interesting work within reach of all who desire it, this new and much cheaper edition is now issued at a price just sufficient to cover the expense of publication.

For sale by all Booksellers, or sent free by mail, postpaid, on receipt of the price, by

The Week.

GENERAL GRANT has allowed himself to be made the instrument of removing General Sheridan. This is but a fresh illustration of the small value of great influence to a man who has not been gifted with discretion enough to keep it. The thing the public has most admired in General Grant, next after his great military ability, has been the singular and admirable persistence with which he has kept out of politics. We considered this, for our own part, so good a quality in a republican General, that we were willing in consideration of it to forgive even his failure to support Congress openly in its conflict with the President. But he has now chosen to abandon the vantage-ground of neutrality, and has thrown the weight of his character and services into the Presidential scale. He has helped the President to diminish the odium of removing Mr. Stanton by consenting to take the vacant place, and has by the same act weakened Mr. Stanton's determination to resist. General Grant is now suffering himself to be made the political medium for transmitting orders which he well knows have no other object than the gratification of Mr. Johnson's spite, and the frustration and delay of the plan deliberately made by Congress for the restoration of peace and harmony. To us the loss of Grant's chances of the presidency is the smallest and least important of the consequences of his mistake. The victor of Missionary Ridge and captor of Vicksburg and Richmond has a place in history to which his accession to the presidency could lend no new lustre; but we confess we could wish that his claims to the gratitude of his countrymen were not weakened, as they are sure to be, by this most unfortunate dip into the troubled waters of politics. Still there is no question, in spite of the abuse that is heaped upon him, either as to his honesty or his loyalty; and in all but the effects of the change on the Southern imagination, Thomas will do as well as Sheridan in Louisiana.

The time has come when we can freely express our appreciation of the service which Mr. Stanton has rendered to the country by remaining in office, without doing any injury to him or to the cause which he has so well served. For many months past he has been exposed to the most offensive suspicion which can attach to a public man—that he sacrificed or smothered his convictions of principle and duty for the mere sake of holding office. Of course, he would not correct misrepresentations himself—no sensible public man does this. But other public men are set right by their friends. Mr. Stanton's friends were forced to be silent. Not that he put any pressure upon them, further than to give his advice in favor of such a course, but that their own judgment told them that to correct misrepresentation would be the surest way to bring about his removal.

Mr. Stanton has not remained in the War Department through the last eighteen months from any motives of ambition or self-interest. His abilities would have gained him an income at the bar vastly greater than his official salary, while his bitterest enemies dare not charge him with a shade of corruption. No one certainly will suspect him of the absurdity of hoping to gain any political advancement by remaining in office under Mr. Johnson. But by simply remaining quietly at his post he has been able to thwart a thousand schemes of mischief, and to put the military force of the Government practically upon the side of Congress, while it was nominally commanded by the President. Sustained by Mr. Stanton, General Howard has made the Freedmen's Bureau a power for good; and the colored people have been helped through trying times into comparative independence. Officers of the army generally are dependent upon the Secretary of War for twenty favors where they can get one from the President, and they have in most cases comprehended this fact, and acted upon it without putting Mr. Stanton to the trouble of reminding them of it by practical instruction. And with all the doubt that has been felt as to the Secretary's position with respect to the President's policy, no one was in any doubt as to his determination to see justice done to loyal men of all colors so far as lay within his legitimate sphere. And thus the power of the administration has really been on the side of justice throughout the South, where alone that administration had any real power. Exceptions there have been. New Orleans and Memphis suggest horrible recollections. But the country owes it to Mr. Stanton that the number of such memories is limited.

It was for the sole purpose of preventing Mr. Stanton's removal that the House of Representatives insisted upon including cabinet officers within the protection of the Civil Office Tenure act. The Senate was willing to leave these officers to the discretion of the President; but the House persisted in restricting his power over them, and the Senate finally concurred. Mr. Stanton has therefore simply complied with the wishes of Congress in refusing to resign, and accepting the extremely unpleasant position of a suspended officer. The action of Mr. Johnson towards the Secretary affords no ground *in itself* for vehement censure; but, as an indication of his stubbornness, his unwillingness to submit to the will of the people, and his intention to take the first opportunity, consistent with his safety, of obstructing the operation of laws which he believes to be unconstitutional and unjust, it deserves emphatic condemnation. It is, of course, very humiliating for the President of the United States to be compelled to execute a policy diametrically opposite to one which he has devised, and to the establishment of which he devoted all his powers. But if he is not willing to accept this position, his remedy is easily found. Let him resign a station so irksome. If he prefers (as of course he does) not to adopt that course, true manliness would dictate a full and unreserved submission to the law and a thorough execution of it. He cannot make his situation any less humiliating by venting his spite upon subordinate officers whose only offence is that they have cheerfully executed laws to which he only grudgingly submits.

As was not wholly unexpected, the Democrats of the West have raised the standard of repudiation, and propose to conduct the next political campaign under its folds. Their plan, as propounded even by such a man as Mr. Pendleton, is to pay off the five-twenty bonds by a fresh issue of greenbacks, which is very like paying them off in draughts of spring water, so as to relieve the country of the burden of the interest. The beauty of the plan is, that it would relieve the country of the burden of the principal, too, as the probabilities are that after the operation the outstanding greenbacks might be bought in at the rate of one cent in nickel for each dollar bill. The advantages of such a conversion must, therefore, be apparent to the most obtuse financier. However, we would go far further than Mr. Pendleton. We see no good reason why the Government, when issuing greenbacks for the payment of the five-twenty bonds, should not also present each head of a family with five thousand dollars in the same medium. In this way every man would be placed in possession of more money than nine hundred and ninety-nine out of every thousand ever had before, and much discomfort and discontent be removed, and the forebodings of the European aristocrats as to the future of our working classes be for ever silenced. The Democratic party has, during its career, supported slavery, secession, and foreign interference. It only remains for it to become the advocate of polygamy in order to have sounded every known depth of political infamy.

Harper's Weekly, in replying to our comments on Mr. Phillips's assertion of the negro's claim to office, alleges that we "asserted the inferiority of the negro race." This is a misapprehension. We predicated nothing whatever as to the natural capacity or status of the negro race. What we did predicate of it was inferiority of achievement. In other words, we asserted not that it was capable of less, but that it had accomplished less; and we maintained that inasmuch as no white man receives the prizes of life for anything short of performance, it would be unfair, as well as inexpedient, to give them to the black man for mere promise or aspiration, and would injure nobody so much as the black man himself. We advocate, and shall always advocate, equality for him before the law, and shall do what we can to remove all social prejudices which throw obstacles in his way to social success which the white man has not to encounter; but we shall always oppose, in his interest as in that of public morality and good government, the bestowal on him, as a matter of charity or because of his lowly condition, of public honors and rewards which white men have to win with hard labor of hand or brain.

The Presidential exposures of the Radical plots get every day more and more amusing. The last phase of the affair consists of affidavits from Benjamin Wood and Roger A. Pryor, denying all connection with it. We recommend Mr. Johnson to systematize the business, and establish a "Bureau of Exposure," with a Chief Perjurer and two assistants, a Concocter of Damaging Statements, and a Forger of Letters, with the necessary clerks, errand-boys, and supernumeraries. At present the work is bungled through the imperfect distribution of its duties, and the Radicals are laughing in their sleeves.

Gen. Pope has at one stroke weakened the strength of the reactionists in his district, and helped in an equal degree the party of Congress. Loyal newspapers had already the Government advertising; now they are to get State and municipal too, which are taken away from "newspapers which are, almost without exception, opposing reconstruction and obstructing and embarrassing civil officers appointed by the military authorities in this district in the performance of their duties, by denunciation and threats of future penalties for their official acts." The punishment is not too severe, even if some of the papers go under for it, and it is well deserved. To a few obstinate, short-sighted, and tolerably malignant editors we are indebted for most of the delay in settling the terms of readmission, and they have suffered, perhaps, as little as any class at the South in the overthrow of the Confederacy. They have, on the contrary, received immunity denied to braver men who fought us once and for all, and who are now, though disfranchised and beggared, submissive, orderly, and unrepining. The Southern press has ever been a proof of the mischievous qualities of an instrument of progress when wielded by demagogues without principle, in a community not half enlightened and unable first to obtain the truth and then to distinguish it from falsehood.

Professor F. W. Newman has been calling attention in England to the danger of a general revolt against marriage on the part of women, unless their social and political disabilities are removed. The movement has, it appears, begun here. He says he has "private information from Americans, who state what they know," that "in some cities of the North—nay, in accomplished and pure-hearted circles, free from any perturbations of religious fanaticism—the essential injustice of the marriage laws is driving women to defiance of them." "A high-minded lady," he says, will, in these cities, tell her lover she will be his, if he pleases, but marry him she will not, because she will not incur the legal yoke. Professor Newman, we regret to say, has on several occasions of late given evidence that he is the victim either of some enterprising and plausible American wag or impostor. He was afraid a year ago that Mr. Johnson would order Grant to disperse Congress, and would call Lee to Washington at the head of the Confederate troops to support him, but this last vision far surpasses that one in absurdity. There is doubtless considerable dissatisfaction with their condition "amongst the women of simple and pure-hearted circles" in Northern cities, but it is not so much from hostility to the institution of marriage in itself, as from the difficulty of entering into wedlock at all with the right sort of men and the right kind of prospects. That there is in any decent circle in any city a leaning in favor of concubinage, is an hallucination. The number of divorces unquestionably increases, but they are mostly obtained at the instance of the husband, or through his bad conduct. A little reflection would convince any intelligent man, one would think, that women will always be, in every civilized country, for physiological reasons, on the whole opposed to anything which tends to make the sexual relation uncertain or precarious, because they find it, once dissolved, more difficult to renew satisfactorily than men do, owing to the earlier and more rapid loss of their personal attractions. When marriage fell into disuse in ancient Rome, it was because the men, not the women, had grown tired of it.

We are bound to admit, having since received a full report of Mr. Curtis's speech on female suffrage in the New York Convention, that he did not advocate female suffrage as a natural right, and that, on the contrary, he confined himself strictly to grounds of expediency, in a very clear and able summing up of nearly everything that can be said on the *pro* side of the question. Anybody who read the replies made to him must be devoutly thankful, as we are, that Mr. Curtis is in political life—we were going to say, no matter what he advocates.

The Reform bill has at last passed in England, the Lords having surrendered all their amendments except one—which establishes a kind of experimental representation of minorities, by allowing voters in places having three or more representatives only to vote for two out of three, or three out of four, of the members. Mr. Bright and the extreme Radicals are violently opposed to this experiment—first, because it is pretty certain to cause a Radical loss in all the cases in which it is to be tried; and, secondly, because he considers the non-representation of minorities a sentimental grievance, and believes that representation, far from doing them any good, will simply enable them on important occasions to paralyze the majority. There is no question that this last objection has more force in it than any other that is made to minority representation. Fancy the Democratic minority fully represented in Congress during the late war. Of the effect of the bill on the constitution of the House of Commons or the character of representation, nothing will be known till 1869. It is now no secret that Mr. Bright and many others of the leading Radicals are greatly dissatisfied with the whole bill, strange as it may seem, not because it does not go far enough, but because it goes too far. Mr. Bright's idea was to enfranchise

for the present only the intelligent artisans; a measure of household suffrage he did not contemplate, inasmuch as this introduces a large body of persons whom, in their present state of intelligence, the Conservatives and the rich will be able to buy or influence. He and his fellow-laborers are now satisfied that the Tories have stolen a march on them, and that the design of the present bill is to create a large voting rabble to be led to the polls by the landlords or bought up by the "new men." The chances that any education likely to be immediately available, will produce much effect for some time to come, the Liberals do not consider very great.

The rumors of war between France and Prussia are stoutly contradicted by the *Moniteur*, which ascribes a strictly normal character to the military preparations in France of which the Cable newsman has been telegraphing us such alarming accounts. But there can be little doubt that both France and Austria do anticipate, and perhaps at no very remote date, a struggle in which Prussia and Russia will probably be ranged on one side. The Pan-Sclavist demonstrations in Russia during the past year have been nearly as alarming to Austria as her Christian demonstrations during the past forty years have been to Turkey. Emissaries are hard at work in Servia, Bulgaria, and among the Austrian Croats and Bohemians, spreading the idea of Sclavonic brotherhood, and deputations from Sclavonic societies in each of these countries have been received and entertained with great cordiality in St. Petersburg. The prospect which probably looms up awfully in Austrian eyes is the triumph of Russia on the Danube and the Bosphorus, and the absorption of all Germany and Hungary in Prussia, and the relegation of the Hapsburgs to Switzerland as private gentlemen. Hence the meeting of the French and Austrian Emperors, and, what is of even more significance, of the French and Austrian Empresses. The Kings and Emperors have hitherto visited Louis Napoleon very freely, but the ladies have kept aloof; but Eugénie has now at last made her way into really exclusive "court circles."

A number of "Garibaldian" volunteers, who went to Crete some months ago, have come home, and have been publishing dismal accounts of the character and conduct of the insurgents, with whom they advise their countrymen solemnly to have nothing more to do. They say they are robbers and murderers, and have no political feeling whatever. Mr. Skinner, a correspondent of the London *Daily News*, however, who was for some time in the Cretan camp, and has come home, tells a different story, and insinuates that the Garibaldians are humbugs. It is a great pity somebody from the United States has not visited the scene of action and sent home trustworthy accounts of what is going on. We know the Cretans are suffering terribly; but what we want to know is what are their chances of success, and on this point we have no information worth mention. All our news of the war consists of rumors picked up in Canéa and Athens, which are about as valuable as the news brought in in the early part of our own war by the "reliable gentleman" and the "intelligent contraband."

It is calculated that the wages of skilled mechanics in the various towns of France range from one to two dollars a day. The general rate of wages in France has increased about forty per cent. in the last fifteen years, while the rise in prices has not been over thirty per cent., leaving the laborer a real advance in wages to the extent of about ten per cent., and this advance, it is confessed, is largely due to the laborer's persistence in demanding, through strikes and combination and other modes of agitation, a larger share in profits. It may be, no doubt, readily shown that the immediate result of any one strike is loss, just as it might be shown that the immediate result of the War of Independence was loss; but in the long run there is no question that strikes affect both public opinion and the rate of wages. Yet it is only within the last three years that combinations to influence the rate of wages have been lawful in France—a striking illustration of the small amount of connection there may be between equality and individual freedom. In aristocratic England such combinations have been lawful ever since 1825. Co-operation in France is proving more and more of a success. The association of masons, for instance, has done remarkably well, but it is found, as might have been expected, that the great difficulty with all these associations is want of capital. Therefore saving must precede co-operative production, and nothing helps saving so much as co-operative consumption through co-operative stores.

The Mexican Government is still holding Maximilian's body, it is said, for a ransom. We have always thought this a peculiarly appropriate mode of replenishing the treasury, and have little doubt the finance minister, whoever he is, will adhere to it. In this way the state makes as much out of Maximilian as if his life had been spared, and at the same time is freed from all anxiety about him. Low as the condition of the "Latin race" is, it still retains some sparks of originality.

The wretched fate of the Jaffa colonists, about which there has been some conflicting testimony, is clearly established by their piteous appeal forwarded through the American consul at Alexandria. One of the first announcements by Atlantic telegraph was the arrival of these Maine farmers in Syria, and it seemed as if the laying of the cable had somehow made the earth revolve contrariwise, and the new course of the sun affect the course of empire. The enterprise naturally sprang from religious fanaticism, but that shrewd, well-to-do Down-East Yankees should turn their backs on the rich plains and productive mines of the West, to invest their savings in an agricultural venture in Palestine, would have been predicted by scarcely anybody. They are vouched for by our consul at Jerusalem as honest and industrious folk, and appear simply to be defective in intelligence; at least, one cannot help thinking that common-school wisdom would have saved them from being duped, both spiritually and materially, by so unscrupulous a pretender as the Rev. Mr. Adams.

Mr. Bowen of *The Independent* denies very emphatically that he attempted to "blackmail" Messrs. Lockwood & Co. by threatening to publish an article condemnatory of the St. Paul and Chicago Railroad bonds unless these gentlemen consented to advertise them in his columns. He alleges that the proof of the article fell into their hands before publication by accident, and was published two months after the advertisement was solicited. As we commented on this transaction at the time, we cheerfully give him the benefit of this correction. But he does not deny what we consider the weightiest of the charges against him: that he offered to insert an editorial puff of the bonds on condition they were advertised in *The Independent*—or, in other words, to advise his simple country subscribers to invest their savings in them—although he at that time knew absolutely nothing of the character of these bonds and had made no enquiry about them. A month later he found out, but only by accident, that they were worthless, so that had Messrs. Lockwood & Co. given him the advertisement when he first asked for it, he would, on his own showing, have recommended his readers to put their money in a species of security which he now declares is and always has been a swindle and delusion. We confess frankly that we look on the issuers of worthless stock or bonds as occupying very much higher moral ground than the publisher of a newspaper who offers for pecuniary consideration to come forward and advise those who trust him to buy them, without making any investigation into their character. *The Independent* is not the only offender in this matter, but it has been one of the worst—and a more detestable offence against the ignorant and unwary we do not know of. The nuisance can only be abated by the public itself. We earnestly urge all insurers and investors not to pay any attention whatever to advertisements of stocks or bonds or insurance companies to which they see even a veiled allusion in the editorial columns of the same paper. Readers ought, the minute they perceive that an advertisement is accompanied by an editorial puff, to button up their pockets as carefully as if they found themselves hustled by a suspicious crowd on the platform of a street-car.

Notes.

LITERARY.

A WORK of more than local value, and which should be in the possession at least of every Congregational church in the country, is the volume of Minutes, etc., of the Maine General Conference for 1867. To the usual reports, tables, and items will be added a record of the churches and ministers of the State, connected with the Conference, from 1672 to 1867, with occasional references from 1643 to 1672. Of the more than three hundred churches thus catalogued the name of each will be given, with the date of its organization. To the names of the one thousand pastors will be joined the principal dates of their ministry, their present or latest known residence, and the particulars of their decease and age. To complete this historical sketch a list of churches will be arranged in the order of organization, and an index of names will facilitate reference. The record and minutes together will make about 140 pages, and orders are solicited in advance to defray the increased cost of printing. Exclusive of postage, fifty cents will procure one copy, one dollar two copies, two dollars six copies, if addressed to Rev. E. F. Duren, Bangor, Maine.——Messrs. Routledge & Sons announce already some of their Christmas publications: a new volume of poetry, "The North Coast," by Robert Buchanan, illustrated handsomely by Dalziel Brothers; "Original Poems for Infant Minds," reprinted uniformly with the "Little Lays for Little Folks," which appeared last year; "Froissart's Chronicles," with the original illuminated plates; a revised edition of "Hogg on the Microscope," with colored plates; a new edition of "Men of the Time," to be edited by George Townsend; a new work on billiards, by William Dufton; "Studies of Shakespeare," by Charles Knight; and a "Robinson Crusoe" in monosyllables, with thirty-six colored plates. ——Messrs. A. Simpson & Co., publishers for the Agathynian Club, apologize for the delay in the appearance of "The Proverbs of Erasmus," for which Mr. Philes's introduction is still wanting, and announce "The Works of the Famous Antiquary, Polidore Virgil," which the title-page of Simon Miller's edition (London, 1663) avers to contain "the original of all arts, sciences, mysteries, orders, rites, and ceremonies, both ecclesiastical and civil," and, naturally, to be "useful for all divines, historians, lawyers, and all artificers." The actuary of the Agathynian Club, Mr. B. W. Bond, has removed to 60 Duane Street.

—We are reminded by the pamphlet of the "Associated Alumni of the Pacific Coast," which held its fourth annual meeting at Oakland, California, June 5, 1867, how real and how increasingly firm is the bond between California and the eastern half of the Union. This organization was happily devised to unite the graduates of colleges, universities, law, medical, and theological schools, and the national military and naval schools, who happen to be brought to the land of gold. The members are almost exclusively American, but the catalogue enumerates several graduates of European universities. On the above-mentioned occasion the Rev. Andrew L. Stone, D.D., well known as the once popular pastor of the Park Street Church, Boston, was the orator, and was subsequently chosen president for the ensuing year. His theme was "The Relation of the College to the State," and it was treated with so much force and eloquence that we wish it might have a larger and a separate circulation. For it was a "plea for culture" against the irreverence of a new, ambitious, and self-confident community, proud of its growth and a little forgetful of what it owes to the past—its true ancestor, however obscured—a plea against materialism and in favor of the ideal, whose court is the college; and an argument for the college as the guardian of republican principles, lifting the poorest citizens to opportunities of usefulness and honor, the conserver of peace, in which alone letters can flourish, the trainer of patriots who "are not enfeebled by philosophy," but rather strengthened to lead in the defence of their land, the teacher of the practical arts and the fruitful methods of all industry, the systemizing support of popular education, which it "stimulates and elevates, drawing up the general level toward its own crested summits." One paragraph so well expresses our own thought in speaking recently of the political value of good intentions that we must quote it here:

"It would be a grand omission in this argument if we failed to remark that the element of light alone is insufficient to establish and ensure public tranquillity. One other element must be added. *Light and Love must be in partnership for this work.* Light without Love is but archangel ruined —the baleful flame of a mighty but malign intellect. *Love without Light is blind, and may do the work of Hate.* Love to prompt, Light to guide— these together do their work well, and make it permanent and abiding. Associate them in human enterprises, and they are strong as God is strong. Light and Love come into bridal union in the Christian College."

—Miss Jex Blake was careful to entitle her book "A Visit to *some* American Schools and Colleges," but her reviewers have not all remembered the partitive. Thus, one who writes in *The Pall Mall Gazette* of July 16 concludes that in American colleges "the religious element is very prominent—far more prominent than in any of our universities, though perhaps not more so than it is in some of our Dissenting colleges." But, using the word in its primitive signification, it was precisely *our* dissenting colleges—Antioch, Oberlin, and one or two further West—that Miss Blake visited. A more remarkable statement ensues:

"This prevalence of religious exercises is a characteristic of their colleges in contrast with ours, as is the almost entire absence of physical recreation. *Athletic exercises and sports appear to be almost unknown to the youth of America.* For boating, cricket, rackets, football, and all the gymnastic exercises in which the boys and young men of this country delight, they appear to have no taste."

We cannot answer for "rackets," though perhaps the people of Worcester can, but the other sports mentioned we seem to have heard of in connection with "the youth of America," especially collegians. Where both sexes are educated together, there may be a tendency to renounce exclusive sorts of amusement and exercise: "the utmost physical recreation which the students of Oberlin indulge in is a country walk, and this"—though we very much doubt it—"is of rare occurrence." This, says Miss Blake, gave the students a "general under-baked look," but their manners she highly approved. Speaking of our public schools, the reviewer caps the climax of naïveté by repeating gravely Miss Blake's remark, that "it is very common to see the children of *members of Congress* and of the richer classes learning side by side with those of laborers and artisans"! And we only wish it were universally true, as it is in some States, that "every child of a certain age is compelled to go to some school or other."

—One swallow does not make a summer. Nevertheless, human capacity is measurable only by its extraordinary and exceptional manifestations. Shakespeare, Socrates, Newton, Bonaparte, Beethoven, are the outposts of human achievement, and each people has its representative man or men to mark the possibilities of development for the humblest individual. This rule applied to the negro race would procure it greater justice than it has yet received. Pushkin for poetry, Dumas for fiction, Douglass for oratory, Toussaint for generalship and administration, Banneker for science, are some of the examples of first-rate ability shown by men of African descent, often with small enough opportunities. To these may be added the late Ira Aldridge, the player, whose return to his native land after the European distinction which he had gained was much to be desired, and was but a few weeks since confidently anticipated. As *Othello* he would undoubtedly have surpassed all his competitors, who resort perforce to burnt cork and black gloves. Both in comedy and in tragedy his talent was conspicuous. He was not without honor save in his own country. With no peculiar gift of language, he traversed Europe from the Volga to the Irish Sea, performing generally if not always his part in English, and yet satisfying his audiences by his action. Bayard Taylor saw him play in perhaps as *bizarre* surroundings as could have been contrived for him: "a mulatto Macbeth, in a Russian theatre, with a Persian and Tartar audience!" This was at the great fair at Nijni-Novgorod, described by Mr. Taylor in *The Atlantic Monthly* for January, 1865. Aldridge he represents to have been—

"A dark, strongly built mulatto, of about fifty, in a fancy tunic, and light stockings over Forrestian calves. His voice was deep and powerful; and it was very evident that Edmund Kean, once his master, was also the model which he carefully followed in the part. There were the same deliberate, over-distinct enunciation, the same prolonged pauses and gradually performed gestures, as I remember in imitations of Kean's manner. Except that the copy was a little too apparent, Mr. Aldridge's acting was really very fine. The Russians were enthusiastic in their applause, though very few of them, probably, understood the language of the part. The Oriental auditors were perfectly impassive, and it was impossible to guess how they regarded the performance."

In the dagger-scene, Mr. Taylor goes on to say, Mr. Aldridge was "quite equal to Forrest;" and "he certainly deserves an honorable place among tragedians of the second rank." Perhaps in more favorable circumstances a higher opinion might have been expressed.

—An humbler but more remarkable illustration of negro capacity is to be found in the person of Said, of whom Mr. Swinton writes from Charleston to the New York *Times*, styling him "a negro pundit." The history of this man is certainly curious. He is a native of Bornou, a Mohammedan kingdom in Central Africa, and was the son of a cavalry chief in the royal army, who was killed in war with a neighboring nation. The boy Said was kidnapped at fourteen by Bedouins, carried to Tripoli, sold to a trader, and by him sent to Constantinople. His first position was that of pipe-cleaner to

Reschid Pasha, minister of foreign affairs. Some years later, in 1852, he was transferred to Prince Menzikoff, then Russian minister plenipotentiary at the Sublime Porte, and on the breaking out of the Russian war he returned with the prince to St. Petersburg, and remained in his service for about two years. Again transferred to his son, who was making the grand tour, he visited almost every country in Europe till 1859, when he came to the United States. A short visit to Hayti satisfied his curiosity in regard to that country. In 1863 he enlisted in the Fifty-fifth (colored) Massachusetts regiment as a volunteer, serving in South Carolina till the close of the war. Being then destitute of employment he hired himself out as a plantation hand, till discovered by persons who appreciated his attainments, and who secured him a school on one of the Sea Islands—St. Andrew's apparently—in which he has had great success. Said knows, more or less perfectly, his native tongue, Arabic (which is learned by the better classes in Bornou), Turkish, Russian, Greek, German, French, Italian, English, and Hebrew. The last-named is his latest acquisition, made a few months ago with the aid of a grammar, dictionary, and Bible procured him by his friends. He reads and speaks most of the languages enumerated, and with all has a more thorough acquaintance than by ear alone, his practice being to study the grammar of each as opportunity offered. While in the army he became a convert to the doctrines of Swedenborg, and has eagerly read all of his writings within his reach. There is no mistake about his race. "He has the thoroughly marked African type of face and skull, with woolly hair and black skin, and he shows the savage aspect the more pronouncedly from the fact that his face is covered with the tribal marks." He is yet young, not forty, and may live to be, if not vice-president, at least minister or consul to foreign parts. It would be touching to witness an examination for the post at St. Petersburg between Said and a competitor like Minister Clay.

—The London *Publishers' Circular* for Aug. 1 repeats the announcement that Charles Dickens will shortly visit this country and give readings from his works in our principal cities. By way of exchange for Artemus Ward, Mr. Arthur Sketchley, whose humor is invested, so to speak, in the Brown Family, and more particularly in Mrs. Brown, is to leave for America in the course of the present month with a view to lecturing in public. It is possible that a clever delivery may render tolerable an hour's discourse from that rather unreadable "British female."——There are but two or three notable publications for the latter half of July as recorded in *The Circular*. One is Col. Churchill's "Life of Abd-el-Kader," compiled partly from French military memoirs and partly from the ex-emir's own dictation (Chapman & Hall). Macmillan publishes the first volume of Prof. Goldwin Smith's course of lectures on the political history of England—"Three English Statesmen." Prof. John Dawson edits, from the posthumous papers of Sir H. M. Elliot, "The History of India as told by its own Historians," the first volume embracing the Mohammedan period (Trübner).——Mr. Murray's list of fall publications is, as usual, rich in valuable and standard works. Among them are a sixth and cheaper edition of Earl Derby's translation of the "Iliad;" a "History of the French Revolution, 1789–1795," by Prof. Von Sybel, of the University of Bonn, translated by Walter C. Perry, of which only two volumes out of the four will appear this autumn; "The Variation of Animals and Plants under Domestication; or, The Principles of Inheritance, Reversion, Crossing, Inter-breeding, and Selection," by Charles Darwin; "A History of the Massacre of St. Bartholomew," based on a personal examination of documents in the archives of France, by Henry White, who professes to have removed many obscurities and misconceptions; "The Huguenots, their Settlements, Churches, and Industries in England and Ireland," by Samuel Smiles; volumes 3 and 4 of "The United Netherlands," by Hon. J. Lothrop Motley, completing the work, and including an index—from the death of William the Silent to the Twelve Years' Truce, 1609; "Studies of the Music of many Nations," by Henry F. Chorley; "A Dictionary of Christian Antiquities," "Classical and Biblical Atlas," and "The Student's Manual of Ecclesiastical History," edited by William Smith, LL.D.——Messrs. Sampson Low & Co. are to reprint Dr. Holmes's "Guardian Angel," Mr. Beecher's "Norwood," a condensation (much needed) of the Rev. J. Doolittle's "Social Life of the Chinese," and Ross Browne's "Land of Thor." They will also publish Prof. Agassiz's "Life and Explorations in Brazil," in two volumes, with illustrations, and "A New Story of American Life and Adventure," by George Catlin, with numerous illustrations.——Messrs. Hurst & Blackett are to publish the Countess Guiccioli's (Mme. de Boissy's) "Recollections of Lord Byron."——Mr. Edward Dicey, whose work on America, written during the rebellion after a personal visit to this country, showed him to be a careful observer (not entirely accurate, though; for in a recent review of Mr. Hepworth Dixon's "New America" he ventures to assert of the Mississippi Valley that it is so uniformly level that a man set down in Colorado could not tell from the landscape whether he was there or in Kentucky), has made into a book some late letters to *The Telegraph*, and called it "A Month in Russia during the Marriage of the Czarevitch" (Macmillan). It contains, among other things, an account of his trip to Moscow and back, and, we are sure, must be eminently readable, and not a little instructive.

—M. Alfred Maury, in a recent lecture drawing a parallel between France and England of the *ancien régime*, sums up the present difference between the two countries, not inaptly, as follows:

"Are you, then, rich, are you strong, are you sufficient unto yourself, without asking help of anybody?—go to England. If you are condemned to earn your bread by the sweat of your brow, by painful exertions, in dependence upon others, go to France. In France all griefs are understood and comforted. It is best to be rich in England and poor in France."

Readers of "The Initials" will remember a similar judgment at the close of that story, where Hamilton says to Hildegarde in their new English home: "After all, a poor man really can enjoy life in Germany: it is only a rich one who could do so in England."

—M. Littré ("Études sur les Barbares et le Moyen Age," Paris: Didier) shares M. Guizot's depreciation of the importance of the German element in French civilization, but far surpasses him in attributing to the Church the sole agency in developing modern society from the ruins of antiquity. Even feudalism is denied to the conquest of Gaul by the Teutonic tribes, whose migration is regarded by the author as an unmixed evil. It was, in his view, the aristocracy of wealth which had already paved the way for feudalism before the arrival of the barbarians. He advances also the singular opinion that the ages of faith ought to be described by Catholics, the approach of the Reformation by Protestants. This would be like crowning Napoleon's "Life of Cæsar," or adopting in Northern schools Confederate text-books on political geography, or M. Duruy's Maximilianized *Carte mexicaine* in the capital of Juarez. Besides, the contrast between the two periods exists only in the perspective of centuries, since the transition covered the space of years. To which, for instance, will belong the work on which Cesare Cantù is now engaged—the Italian heresies and heretics?

—The hymns of peace inspired by the Great Exposition, including that for which Rossini composed the music, performed before the distribution of the medals, have been published, and do not differ in wretchedness from those which great events in all countries are sure to engender among the poetasters. A French journal is reminded by them of a comical incident which happened years ago. In 1811, Monsieur Gérin, who for forty years was director of the *caisse* of secret funds, received orders to pay five thousand francs to a poet who had written a cantata on the birth of the King of Rome. The refrain of this cantata was: "We swear to conquer or to die for the noble King of Rome!" In 1821, at the birth of the Duke of Bordeaux, the same poet sent in the same cantata, having only altered the name to be celebrated by it. This time Gérin had to pay only three thousand francs. But when the Count of Paris was born, the same cantata appeared for the third time, except that now it swore to conquer or to die for Helene's son. Louis Philippe economically granted only two thousand francs. A few days after the February Revolution the immortal cantata was on hand again, swearing, with admirable flexibility, to conquer or to die "on the ground of the fatherland." The republic also paid a thousand francs. Unfortunately M. Gérin died before the birth of the present Imperial prince, so that it is not known if the ode has not on this occasion also done duty and reaped its golden reward.

—Château-Gaillard on the Seine, in Normandy, is perhaps unrivalled for the variety of associations attaching to it: as a military fortress of remarkable strength and admirably chosen position, as a well-preserved relic of mediæval architecture on which M. Viollet le Duc has bestowed the most patient and faithful researches, as the work of Richard the Lion-hearted, and as a favorite subject for Turner's pencil. All these points are elaborated very agreeably by a writer in *The Saturday Review* for July 27, who dwells particularly on the causes which led to the construction of the fortress contrary to the plighted word of its royal builder, on its importance in the chain of the defenses of Normandy against Philip Augustus, and on the consequences of King John's failure to relieve it when besieged by the French monarch, who finally took it. The first consequence was that Normandy slipped from the English grasp into the hands of its rightful possessors. The second was, to use the writer's own words, "the ruin of a system as much as of a camp. From that dark donjon, from those broken walls, we see not merely the pleasant vale of the Seine, but the sedgy flats of our own Runnymede."

THE LIFE AND DEATH OF JASON.*

No narrative poem comparable with this in scope of design or in power of execution has been produced in our generation. By this work Mr. Morris wins a secure place among the chief English poets of the age. The production of such a poem is not only proof of a rare individual genius, but the sign of the abiding vigor and freshness of our literature. Mr. Swinburne has ventured in *The Fortnightly Review* to greet this work with the highest praise, but in doing so he unconsciously passes condemnation on his own poems. A sharper contrast could hardly be drawn than that presented by the methods of treatment of a classic theme followed by one and the other poet. The manliness, the straightforwardness, the reserve of feeling which distinguish Mr. Morris's work are the very opposite to Mr. Swinburne's feminine passionateness, extravagance, and self-exposure. Mr. Morris is imbued not only with the form of the pagan legend, but in as great a measure with its spirit as is perhaps consistent with the modern intellectual temper. He has a strong sense of the dignity and proportion of art, and he treats his theme not as a Greek poet would have treated it, but as an artist aware of the impassable barrier set up between the ancient and the modern moods of feeling and manner of expression. Pouring his old wine into new bottles, he preserves the perennial freshness of its genuine flavor.

"The Life and Death of Jason" belongs to the same class as the "Odyssey." Like that it is a poem of fable, romance, and adventure. In these days, to venture on a narrative poem of more than ten thousand lines is a bold undertaking. The art of story-telling grows more uncommon and more difficult as the world grows older. Stories belong to childhood, and the youth of man. The inventions of later days fail in the essence of story. To tell a good story a man must choose an old one, with the outline of which he has himself long been familiar, and which other men heard first when they were first waking to the wonders of life. It is the twice-told tale that delights the old no less than the young. The poems which are in any real sense popular, the poems which have become a part of universal literature, are all either simple narratives or narratives in a dramatic form. The "Iliad" and the "Odyssey," the "Divine Comedy," the "Nibelungen Lied," the old Ballads, "Paradise Lost," are all illustrations of this fact, and Hamlet and Faust appeal to men as much through their story as through the delineation of character and experience for which the story affords room. All men care to know what other men have done and suffered; it is but the few who are much interested in what other men have thought and felt. For the thoughts of men change from age to age, and feeling has different modes in each generation; but the deeds of men are the concrete forms in which their thoughts and feelings take shape, and awaken a sympathy such as cannot be aroused by the mere utterance of passion or reflection. The woes of Prometheus, the wanderings of Ulysses, the fury of Orestes, the journey of Dante, are types or symbols of universal experience, and have an interest not limited by time or bounded by race.

The most popular poems of our own day show how strong this story-loving instinct still remains. "The Lady of the Lake" has ten readers for one of the "Prelude;" "Evangeline" and the "Idyls of the King" are read and re-read, and will be read long after "Voices of the Night" and "In Memoriam" have taken their place among the purely literary records of the sentiment of an age that is gone.

But to tell an old story well is an art which few poets have possessed; and we doubt whether Mr. Morris has told so well the old story which he has chosen to repeat that his version of it will take its place among the everlasting works of the poets. The critic cannot absolutely forecast the verdict of the future; but even if Mr. Morris has failed to win the perennial fame which few poets succeed in winning, he has at least shown the possession of faculties such as few in any time surpass.

It is a great merit of his work that, in this period of self-consciousness, of morbid introversion, of exaggeration of the interest of individual feeling and experience, he has told his story, with but very slight exception, objectively, with simple regard to its own development, and with no direct expression of the emotions or thoughts its course awoke in himself. And he has, moreover, shown one of the highest qualities of the poet in the vividness of imagination by which he has reproduced scenes remote from experience with all the distinctness of reality, and invested imaginary characters with the natures of living men. The most marked characteristic of his poem is its picturesqueness; there is scarcely a page that does not give a picture to the eye; and this becomes at once a merit and a defect, for in the limited compass of his story the variety of pictures cannot be thus numerous without involving an occasional repetition not of details, but of what, in the language of pictorial art, is called motive. Mr. Morris's landscapes have frequently, underlying their diversity of detail, a general similarity of outline and of tone; his descriptions of persons and incidents might here and there be interchanged without apparent discordance. Every landscape, every description is clear, almost every one is finished and beautiful in itself, but there are too many which differ only in those minor points which, while they indicate the distinctness and truth of the poet's vision, yet do not serve to give a strong enough impression of absolute variety. There is in his poem something of the prolixity of a mediæval romance, and in this is its weakness. Though there is no single page to which, standing alone, praise might not belong, yet the general effect of the poem, and, we regret to believe, its permanent interest, would be increased by the omission of many of them, or at least by the condensation of many into a few. Each reader would, it is not improbable, select different passages as not adding to the effect of the work; the poet himself could alone determine what is least needful to the impression he has sought to produce.

Of Mr. Morris's general conception of his theme, his delineation of his characters, and of his picturing of special incidents, there is little to be said but praise. Only on one point does he seem to us to have failed to conceive justly the real condition of his story—this is the character of Medea, and the feelings of Jason towards her. Where he has followed most closely the original legend and its natural suggestions he has been most successful; where he has departed from it he has at best achieved only a doubtful success. It is dangerous to vary from a model set by such artists as the Greek poets from whom the story of Jason and Medea has come down to us. Although in Mr. Morris's Medea the union of the beautiful and lovely woman with the fell sorceress is occasionally admirably presented, yet, with a tendency easily explicable by the general direction of modern sentiment, he has been led to dwell too strongly on her lovely womanhood, and has not reproduced the awful and abiding sense of her magic art, and of her ruthless nature subdued to what it worked in, which alone can sufficiently account for the desertion of her by her lover, who owed to her both his life and his glory. In the mingling of fear with fascination, of loathing with love, are the secret of Jason's feeling to her and the explanation of her own misery. She loved as a woman, but even in her love she had the pitilessness of a sorceress. A poem such as this is not to be appreciated by such extracts as can be made from it in a brief notice, but we can at least give a specimen of the picturesqueness which makes its pages a gallery of fair scenes, colored by the hand of a master. Here is a description of the palace of King Œetes:

> "The pillars, made the mighty roof to hold,
> The one was silver, and the next was gold,
> All down the hall; the roof, of some strange wood
> Brought over sea, was dyed as red as blood,
> Set thick with silver flowers, and delight
> Of intertwining figures wrought aright.
> With richest webs the marble walls were hung,
> Picturing sweet stories by the poets sung
> From ancient days, so that no wall seemed there,
> But rather forests black and meadows fair,
> And streets of well-built towns, with tumbling seas
> About their marble wharves and palaces;
> And fearful crags and mountains; and all trod
> By many a changing foot of nymph and god,
> Spear-shaking warrior, and slim-ankled maid.
> The floor, moreover, of the place was laid
> With colored stones, wrought like a flowery mead;
> All ready to the hand, for every need,
> Midmost the hall, two fair streams trickled down
> O'er wondrous gem-like pebbles, green and brown,
> Betwixt smooth banks of marble, and therein
> Bright-colored fish shone through the water thin."

The description of the island of Circe, with the fine imaginative conception of the victims of her magic arts and of the empty shades whom she made the agents of her enchantments, the description of the beach of the Sirens and of the garden of the Hesperides, might all be cited as instances of the full and easy power of the poet in picturing nature as she shows herself under various aspects of beauty. It is plain that he is a lover and student alike of nature and of art. There is nothing borrowed or at second-hand in his work, and his lines have often a simple freshness which recalls the charm of Chaucer, or a rich fulness which reminds one of the sweetness of Spenser.

The tragic interest of the story rises towards the end, and all the tender feeling and fancy of the poet are quickened into higher expression as the gloom cast by the shadow of impending and irresistible fate darkens round Jason and Medea. The exulting joy of Medea, having compassed the death of King Pelias, and secured the triumph of her love, is finely contrasted with the bitterness of her woe when deserted by him for whom she had dared so much. At first,

> "'O love!' she said, 'O love! O sweet delight!
> Hast thou begun to weep for me this night?

* "The Life and Death of Jason. A Poem by William Morris." Boston: Roberts Brothers. 1867. 16mo. pp. 307. (Reprinted from the London edition.)

Dost thou stretch out for me thy mighty hands—
The feared of all, the graspers of the lands?
Come, then, O love! across the dark seas come,
And triumph as a king in thine own home,
While I, the doer of this happy deed,
Shall sit beside thee in this wretched weed;
That folk may know me by thine eyes alone
Still blessing me for all that I have done.
Come, king, and sit upon thy father's seat,
Come, conquering king, thy conqueror love to meet.'"

But when, long afterwards, she knows herself deserted of Jason, she says:

"'Would God that Argo's brazen-banded mast
'Twixt the blue clashing rocks had never passed
Unto the Colchian land! Or would that I
Had had such happy fortune as to die,
Then when I saw thee standing by the Fleece
Safe on the long-desired shore of Greece!
Alas, O Jason! for thy cruel praise!
Alas for all the kindness of past days!
That to thy heart seems but a story told
That happed to other folk in times of old;
But unto me, indeed, its memory
Was bliss in happy hours, and now shall be
Such misery as never tongue can tell.'"

We have no disposition to point out the occasional carelessness of rhythm and rhyme, the too frequent recurrence of certain epithets, and other minor faults which injure here and there the structure of Mr. Morris's verse. They are faults which a little care would remove, leaving the poem remarkable among contemporary works for its simplicity and strength of diction.

The American edition of the book is neat, but disfigured with errors of the press which its publishers should hasten to correct. For instance, on p. 43 a line seems to have dropped out after "More than those others whose crowned memories." On pp. 49 and 51, Amphitryon is four times misprinted Amphytrion. On p. 143, "And round her panting side his fingers steal," is travestied by the substitution of "painting" for "panting." On p. 254, the line in a passage quoted above, "Still blessing me for all that I have done," is rendered unintelligible by substituting "him" for "me." There are other hardly less serious blunders.

Mr. Morris himself commits one curious anachronism, as we suppose. When, after the gain of the Golden Fleece, Medea urges Jason to haste in their flight, the poet makes her say:

"'Haste, then! No word! nor turn about to gaze
At me, as he who in the shadowy ways
Turned round to see once more the twice-lost face.'"

But Orpheus was himself one of the Argonauts, and not till long after the return of the expedition was Eurydice lost to him.

JEAN INGELOW'S NEW VOLUME.*

If Miss Ingelow's pretty reputation can stand against the assault she has made upon it in this volume, it is of firmer fabric than we suppose. The "Story of Doom" is a name with a double meaning, such as the authoress is fond of giving to her compositions, for it signifies, besides a most fantastic romance concerning Noah, his wife, their contemporaries, the ark, and the deluge, the swamping of Miss Ingelow's frail poetic bark. In the course of this story Noah is represented as saying of Adam:

"Oh! as for him,
It was for this that he full oft would stop,
And, lost in thought, stand and revolve that deed,
Sad muttering, 'Woman! we reproach thee not;
Though thou didst eat mine immortality.'"

And so the unhappy reader of this volume, if he have a tincture of charity in his nature, will full often stop and mutter sadly:

"Woman! we reproach thee not,
Though thou dost waste my happy mortal hours."

"Shall bleat of lamb," asks Miss Ingelow with great ingenuousness, "console one for the foregone talk of God?" With utmost sincerity we answer, Certainly not. Noah's wife tells him:

"I do remember that there came one day
Two of the grave old angels that God made,
When first He invented life (right old they were,
And plain, and venerable); and they said,
Rebuking of my mother, as with hers
She sat, 'Ye do not well.'"

We take the part of one of these grave old angels and, addressing the authoress, say, "You do not well."

The flattering commendations that Miss Ingelow's former volume of verse received, and its surprising popularity in America, have plainly been injurious to her by inspiring her with misplaced confidence in her poetic abilities. The faults which lay obvious to criticism in her earlier productions are all intensified in her new collection of verses, while such excellence as then in some degree redeemed them has almost disappeared from her work. The want of a controlling sense of form and artistic proportion, which most of the poetry written by women displays, and which was always conspicuous in Miss Ingelow's poems, is painfully apparent throughout this volume. Loose, imperfect, half-formed fancies hold the place that should be held by the clearly-defined images of genuine poetry, strainings after effect are mistaken for the reaches of inspiration, and poor and barren thought is matched with versification equally poor.

Even in narrative, where Miss Ingelow formerly succeeded best, she now fails. The poem called "Laurance"—the very spelling of the name betrays the affectation of the writer—is a feeble imitation of Tennyson's modern idyls, and its plot is too commonplace for a cheap novel. It is, indeed, by her conscious or unconscious imitations of other poets that the limits of Miss Ingelow's poetic perceptions and faculties may be most clearly marked. She gives us one piece in "humble imitation" of Milton's "Ode on the Nativity," another in imitation of the "Old Style," another in the "Old English Manner," all of which, by their diversity from their models, we would rank among what the writer calls her "Contrasted Songs;" and so when she falls into imitation of Mrs. Browning or Tennyson the resemblance is confined to a trick of manner and never approaches to real similarity of style.

We have no question that this volume will find admirers. What books do not find admirers in these days when all the great, undiscriminating public reads? In the extracts from the favorable English notices of the volume, which the American publishers have printed for the enlightenment of newspaper critics, we find *The Athenæum* speaking of "the lyrical sweetness, the tenderness of sentiment, and the brilliancy of description which are to be found in many of the poems," while *The Imperial Review* asserts that some of these poems "are full of much subtle beauty, and through them runs an undercurrent of pathos and tenderness." There are readers who positively prefer bad to good poetry. We have known worthy people who have set Pollok's "Course of Time" above "Paradise Lost," and it is certain that Mr. Tupper's "Proverbial Philosophy" is far more widely read than the poems of Mr. Browning. It is sometimes urged that these books and such as these have their use in meeting the wants of a class incapable of appreciating those of a higher order, and that they even serve the purpose of stepping-stones to better things. There is no doubt a modicum of truth in this notion, and the Genial Critic may at once conciliate the publishers, his own interest, and his conscience by lavishing favorable epithets upon productions of doubtful abstract merit but against the purely moral tone of which nothing is to be said. But criticism has a higher office than this. The direct moral influence of a book may not be bad, while its indirect moral influence, by lowering the standard of taste or by perverting the correct judgment of its readers, may be very injurious. Of no class of writings can this be so confidently asserted as of poetry. Few persons are competent to pronounce upon the merit of poetry that does not offend by open violation of the rules of art. But the difference between good and bad poetry, innumerable as the varieties of each may be, is a difference not of degree but of kind. No man by reading Alexander Smith or Walt Whitman will be better fitted or more inclined (save on the principle of reaction) to relish Shakespeare or Wordsworth; the puerilities of Tupper form no introduction to the masculinity of Dryden or Lowell. The taste may be subtly corrupted, the judgment insidiously weakened, and it is for sound criticism, aware of the dignity and responsibility of its office, not to shrink from exposing pretension, nor to be content to leave to time the task of bringing a swollen reputation to its just size. The Laura Matilda school has vanished; L. E. L. and her imitators are forgotten; and unless Miss Ingelow does better in her future volumes than in this her name will not wait long for peaceful oblivion.

* "A Story of Doom, and other Poems. By Jean Ingelow." Boston: Roberts Brothers. 1867.

PRISON DISCIPLINE IN THE UNITED STATES.*

Among the many questions to be disposed of in the Constitutional Convention, we bespeak its proper share of attention for that of Prison Discipline. A topic to which Howard, Beccaria, Bentham, and Livingston gave so much thought in its earlier aspects, and which has since occasioned so much legislation and so many controversies, will be found to have been carried far beyond the crude notions which so long stood in the way of the improvement of prisons. There are certain principles, long ago laid down, which have now become wrought into the whole fabric of penal law. *Pœna in hominum emendationem statuitur*, says Cicero, which, being interpreted into the modern phrase, reads, "The end of punishment is the

* "Report on the Prisons and Reformatories of the United States and Canada, made to the Legislature of New York, January, 1867. By E. C. Wines, D.D., LL.D., and Theodore W. Dwight, LL.D., Commissioners of the Prison Association of New York." Albany, 1867. (pp. 546.)

reformation of the criminal." *Quem pœnitet peccasse*, says Seneca, *pene est innocens;* that is to say, a convict who repents and does the first works shall have his sentence shortened, or be pardoned altogether. This is the alleged basis, and, to some extent, the actual practice, of prison discipline in nine-tenths of the civilized states of the world. But, unfortunately, theory and practice in this matter are often so utterly divorced that it needs some plain statements like those of Dr. Wines and Professor Dwight in the volume before us to show us how, with a perfect theory, we may have the most outrageous administration of prison affairs.

This report grew out of the appointment of certain committees, by the New York Prison Association, in 1865, to investigate the prison systems and the administration of criminal justice in the several States of the Union. These committees included other names, but the chief labor was imposed upon Dr. E. C. Wines and Professor Theodore W. Dwight, who undertook to visit and examine all the important prisons of the loyal States, and to report their condition and management. The first part of their task was completed in 1865, but the preparation of the report was delayed during the whole of 1866 by the magnitude of the work, and by the fact that the same gentlemen, with others, were in that year appointed to investigate in detail the affairs of the New York prisons, which had not been included in their examination in 1865. The results of this last-named commission were also compiled by Messrs. Wines and Dwight, and published, along with much other interesting matter, in the twenty-second annual report of the Association. At the same time they were carrying through the press the volume before us, which did not finally appear till some weeks after the annual report, and may be said to complete and summarize that. We have, then, in this volume the sum and resultant of two years' diligent work, performed by two of the most competent persons in the country for the part assigned them. And the book comes forth at a time when many events have combined to give an unwonted interest to the subject which they discuss.

It is well known to all who observe the statistics of our prisons that during the latter years of the war they were, in general, scarcely half-filled. From various causes the commitments fell off, especially of male convicts, and though in most places there was a great increase of female convicts, yet the aggregate of both sexes fell far below the average of 1860. But no sooner had the war closed than this was all changed. Crime among women instantly began to diminish, while it was alarmingly increased among men. At the Auburn Prison there were less than 200 commitments for the year ending April 1, 1865—the last year of the war; in the following year there were more than 400. At the Massachusetts State Prison in the last year of the war there were 80 commitments; in the first year of peace 259, or more than three times as many. At the Eastern Penitentiary of Pennsylvania, the number of commitments before the war closed was about *nine* in a month; after the war it ran up to *thirty* a month. In Illinois, in 1865, there were about 575 State prison convicts at Joliet; in 1866, they had increased to 1,100; the commitments being at the rate of fifty or sixty a month. Nor was this startling increase of crime the only thing to be noticed. It was found in nearly all the State prisons that from 50 to 75 per cent. of the new convicts had served in the army or navy, where many of them had borne a good record. These two facts—the growth of crime and the imprisonment of soldiers—have compelled many persons, hitherto indifferent, to concern themselves in prison discipline.

The instant this began to be done, it began also to be seen how much the subject had been neglected in America of late years. The great experiment of the Irish convict system, which had been going on for a dozen years with extraordinary results, was scarcely known here, and had not perceptibly influenced the administration of our prisons, though it was revolutionizing those of England and the Continent. Our prison industries which had been our boast in earlier times had fallen into bad ways, and the prisons in consequence were very costly, without returning any compensation for their cost. In some of the States, and notably in New York, political influence had secured the control of all prison appointments and had degraded the standard of qualification shamefully. There was found to be no proper inspection of the lower prisons, and no sufficient classification of the prisoners anywhere. All these evils and many more Messrs. Wines and Dwight describe as existing in a greater or less degree in all the States visited by them. They pay Massachusetts the compliment to speak of her prison system as the best in use, but they have serious fault to find with that. They cannot accept the estimate which the Philadelphians place upon their separate system, but they declare that it ought to be partially adopted elsewhere. Upon the whole, they recommend the Irish system as the most perfect and the most successful yet known, but they regard some modifications of it essential to its success in America.

Such are their conclusions in general; but the fulness of statement and the wealth of suggestion presented in the Report cannot even be conjectured from our meagre abstract. Nearly all the topics which have ever been treated by writers on prison discipline are here touched upon, and most of them at some length. The statistics both of prisons and reformatories so far as they are given are valuable, while the abstract of penal legislation and administration in several of the States, and the recorded experience of magistrates in regard to pardons, are most curious, and, at the same time, quite important. The arguments used and the evidence brought forward against the contract system of labor in the prisons, though less extended than in the annual report above referred to, are yet clear and convincing. On this and other points the two volumes make an encyclopædia of research and information which must be consulted by all who would study the subject, and can only be superseded by equal diligence working in a more extended field. When, for example, the whole circuit of the American prisons shall have been made, and their condition shall be compared and contrasted in mass and in detail with that of the prisons of Europe, the volumes which record so vast a labor will exceed in value those now given to the world, just as these surpass all that have gone before them. But who is sufficient unto these things? "Enough," said Rasselas to Imlac; "thou hast now convinced me that no man can ever be a poet." The researches of the Prison Association show, among other things, how endless is the task at which its members toil.

Ilias und Odyssee und ihre Uebersetzer in England, von Chapman bis auf Lord Derby. Von Dr. Wilhelm Henkel. (Hersfeld, 1867.)—An interesting pamphlet on the "Iliad" and "Odyssey," and their English translators, from Chapman to Earl Derby. In his introductory remarks Dr. Henkel shows that language and literature in England were, during the last three centuries, enabled to develop themselves much more undisturbedly and gradually than in Germany, where internal dissensions and unhappy religious wars, begetting an inevitable dependence upon foreign nations, too often impeded the sound and popular growth of literature. The French models never exercised the influence on English literature which they did during the eighteenth century in Germany. English scholars, moreover, abandoned the Latin as the language of science and built up a national language and literature much earlier, whilst in Germany the national literature inaugurated by Luther's translation of the Bible fell soon after the Reformation into a lamentable decay. As late as the middle of the eighteenth century the educated classes looked for literature across the Rhine, and Frederick the Great, therefore, was not without reason surprised to make acquaintance in Gellert with the first famous contemporary poet in that "barbaric" German tongue. But even in the reigns of Henry VIII. and Elizabeth we find quite elegant English versions of classical authors—as, for instance, those by Grimwald of "Cicero de officiis" and of Xenophon's "Cyropædia," and that of Earl Surrey, who introduced the blank-verse into English poetry, and contrived to give it extraordinary polish by following the Italians. It is precisely this outward polish and ease of treatment that have ever distinguished the English translator of Greek and Latin works from the German translator. It might almost be said, that between Pope's translation of Homer and Voss's there exists the same gap as between the philosophical and theological studies of the English and of the Germans. English translators generally strive to please by freedom of movement and agreeableness of expression, whilst German translators study to penetrate their author to the smallest details, and with anxious accuracy adapt themselves to the very words of the original, with the abundant aid of scientific researches. Hence it cannot be denied that the classics have in the English language been more popularized and have exercised a more lively influence than in the German language, and this especially with historians and orators. In studying the old histories of constitutions they have everywhere found analogies with their own history, and Demosthenes has had for a Pitt, Burke, Fox, or Brougham far more practical value than for the German scholar.

In the second chapter of his book the author reviews the Homeric translation of George Chapman, who was during his lifetime severely assailed for selecting the iambic measure of fourteen syllables used for ballads, and who replied to his adversaries in no complimentary strains. Dr. Henkel acknowledges, with Hallam, that this translation is "often exceedingly Homeric," and that "by his own innative Homeric genius Chapman has thoroughly identified himself with Homer." Dryden, "happily," produced no translation of Homer, but inaugurated by his stiff but elaborate translations of Virgil, Juvenal, Perseus, Horace, Ovid, and Theocritus the epoch of French influence. Then came his follower Pope, whose translation of Homer was excellently characterized by Richard Bentley's *mot:* "It is a pretty poem, Mr. Pope, but you must not call it Homer." "We find that

the facility of Pope's rhyme, the false ornaments which he attached to the ancient Greek, and his departure from the nice discriminations of character and speech which prevail in Homer, are faults now universally admitted." Less fault Dr. Henkel imputes to Cowper's translation, published seventy years after Pope's, because he avoided too great license, extrinsic adornments, and the sins connected with these. Coming to the more recent translators, who have searched for a new metre, the author concedes that neither hexameters nor dactyls are adapted to the nature of the English language, but iambs alone, in spite of Matthew Arnold's contending for the use of the original metre in English translations. He combats vehemently Arnold's opposition to the blank-verse, and cites Lord Derby's translation, which came very near to the tone of the original, in support of his opinion. He ridicules Mr. Arnold's idea, "that there is no reason, in the nature of the English language, why it should not adapt itself to hexameters as the German language does; nay, the English language, from its greater rapidity, is in itself better suited than the German for them;" and cites against this assertion Klopstock's "Messias," Goethe's "Hermann und Dorothea," and Voss's translation of Homer, in which the hexameter is used with greater dexterity than by any English author, as is made to appear from quotations. The little book gives a very clear and condensed review of the whole controversy.

Anti-slavery Addresses of 1844 *and* 1845. By Salmon Portland Chase and Charles Dexter Cleveland. (London: Sampson Low, Son & Marston; Philadelphia: J. A. Bancroft & Co. 1867.)—In the incessant conflict with slavery, few on the Northern side have had the leisure, fewer still the forethought, to preserve the documents illustrative of every stage of it. No library that we are aware of contains even a fair collection of the pamphlets, speeches, and papers which were the efficient means of the thirty years' agitation ending in secession, civil war, and emancipation. This elegantly printed little book is the private enterprise of a prominent actor in the strife and the author of one of the addresses, now in England. In what quarter he anticipates a remunerative sale we do not know, but he has none the less rendered a service to history for which all of us can afford to be grateful. The two addresses convey a vivid conception of a very important era in American politics: that, namely, just following the founding of the Liberty Party, and just preceding the admission of Texas and its demoralizing train of events—from February 22, 1844, to June 12, 1845. The Philadelphia address is a better electioneering document than Mr. Chase's, and in it one may read the astounding proofs of the control of the Government by Southern interests from its foundation. Who passed the tariffs which have caused us so much odium in British eyes, and which, we venture to say, are even now regarded by the majority of well-educated Englishmen as the real cause of the rebellion, is also shown with great clearness; and as the freedom of the country from direct taxation up to 1861 is not often considered in connection with the tariff, we venture to make some quotations from the appendix:

"According to the Constitution *direct taxes* must be apportioned among the several States in the ratio of their representation; and as the slave representatives would increase this number, it would also increase the amount of tax in the same ratio. . . . When, therefore, at the close of the last war [1812] our country was in debt about 120 millions of dollars, the South resolved that this should not be paid by direct taxes, but by duties laid upon imported goods. Accordingly the tariff of 1816 was established. It was then emphatically a Southern measure. That tariff, for instance, admitted the articles used for the clothing of slaves at a duty of *five cents* on the dollar's worth, and charged *twenty cents* on the dollar's worth of finer articles used for the clothing of free laborers, thereby making the honest labor of the Free States pay *four* dollars, while the slave labor of the Slave States paid but *one*, for clothing.

"The Free States, however, with their industry and skill, soon accommodated themselves to this state of things, and their manufactures, by degrees, rose to a height of great prosperity. But no sooner was our national debt paid than the South, ever watchful of its purpose, resolved to strike a death-blow at the prosperity of the Free States; and, accordingly, the celebrated 'compromise' tariff of 1832 was devised and carried; in which the 'compromise' was, as it ever has been, *all one way*. Nothing is clearer than that the slave power put on the tariff in 1816, and took it off in 1832. They have done just as they pleased."

As these addresses were designed to further the election of James G. Birney to the Presidency, they have something to say about the rival candidates, J. K. Polk, of the Democrats, and Henry Clay, of the Whigs. Mr. Clay was probably as devoted, and certainly as useful, a friend as slavery ever had; yet his support of the tariff is generally ascribed to disinterested motives. His character, notably as a duellist, is here exposed in a way to make Mr. Greeley indignant, but the indictment might easily have been made twice as strong. Mr. Cleveland has added a letter of his own to the Philadelphia Bible Society, resigning (rather than be dropped at an approaching election) the presidency of that body, to whom his authorship of the Pennsylvania address had given offence. This document belongs to a different series from the foregoing, and one which shame would persuade us to destroy, but which truth compels us to preserve—we were going to say, religiously.

What is Free Trade? An Adaptation of Frederick Bastiat's Sophismes Economiques. Designed for the American Reader. By Emile Walter, a Worker. (New York: G. P. Putnam & Son.)—Bastiat's "Sophismes Economiques" was translated twenty years ago, during the free-trade agitation in England, by Mr. Porter, the author of "The Progress of the Nation," and was widely circulated, under the title of "Popular Fallacies regarding General Interests." It contains probably the most telling statement of the leading principles of the free-trade theory ever published, and is perhaps unsurpassed in the happiness of its illustrations. Mr. Walter has apparently adopted Mr. Porter's translation, and has adapted it to the use of the American reader by introducing American allusions and examples instead of French or English ones, and notably by setting up Horace Greeley as a target for the satire and sarcasm. Horace Greeley plays the part of the devil for most preachers of free-trade in America, but, luckily for himself, seems to enjoy his bad reputation, and roars and lashes his tail, apparently in perfect content with his part. Why Mr. Walter calls himself "A Worker" it is hard to say. Whatever the reason, it looks like a piece of affectation. There is nothing singular or distinctive in being "a worker" in America. He ought as well call himself "A Man with Two Eyes."

Early and Late Papers. By W. M. Thackeray. (Boston: Ticknor & Fields.)—Those young gentlemen who have picked up Thackeray's sucked orange and have grown cynical because it is dry and tasteless, and who suspect there is no more juice anywhere, and who begin to entertain a melancholy admiration for their own power of suction, will do a very good thing for themselves if they will read this little book of essays. Thackeray is seen in them at his best, as we think; in his easy, essayistic chair, writing without the set purpose of the satirical novelist, and appearing sensible, kindly, and manly, and, if now and then a little bit affected, not more so than is permissible and pleasant in the essayist. We hope Mr. Fields, if it is to him belongs the credit of the labor as well as of planning this enterprise, will take the necessary pains to collect other similar volumes, for which the materials must be quite plenty. We have delayed mention of the volume, but no harm is done, for it is not a book for a season, but one that will be loved and praised years hence—perhaps as long as wit, delightful humor, knowledge of the world, and friendliness find admirers.

Essays by Dora Greenwell. (New York: George Routledge & Sons.)—These five essays are gracefully and spiritedly written, and are evidence that the mind of the author is accustomed to play lightly on the surface of things, but they show no capacity for deep thought on any of the themes discussed. It is a religious book; for, although its subjects are not all such as would necessarily to another person than the author suggest religious reflections, yet the devotional turn of her mind has, as in such matters is generally the case, caused her to view them all from the religious standpoint. To minds which hold to the chief Protestant dogmas and forms and are yet unable to find in them all the sentiment which they desire, this little work will seem, as will also a former book by the same author, "The Patience of Hope," almost as the gate to a new world of beauty; although to one accustomed to Catholic books of devotion it will appear tame and cold, while it may very possibly strike some as being tedious and aimless.

A Sketch of the Route to California, China, and Japan, via the Isthmus of Panama. (San Francisco and New York: A. Roman & Co.)—This book promises to be useful and amusing to every traveller, and we are inclined to recommend it on both these heads. The reader—as if to impress him with the magnitude of the journey—is supposed to start from Europe, and to have preferred the route by the Isthmus to that by the Cape of Good Hope. All that he needs to know, in order to get on smoothly, is then told in these chapters; but they were composed before the *Colorado* had made her first trip to Japan.

A useful companion to this guide is the "Chinese and English Phrase-book" published by the same firm, having both the Chinese characters and their English pronunciation, adapted to the wants of merchants, travellers, and families. With this and the Japanese phrase-book published by Messrs. Hurd & Houghton one may boldly step ashore at Yokohama or Shanghai.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

THE CRISIS AT WASHINGTON.

Mr. Johnson seems to be fully determined that the process of reconstruction shall not go on smoothly if he can possibly prevent it; and the means which he is adopting to prevent it would be a very interesting subject of study if they were the result of any particular line of thinking into which even a small number of persons are likely to fall. But the truth is, that he is a kind of man who need not be looked for in a high place in a constitutional government once in a thousand years, and who could not have got into a high place in this one without a series of accidents such as are not likely ever to occur again. The qualities which are cultivated in the politicians of a representative government are invariably pliability and adaptability, or, in other words, talent in finding out what is practicable or what the majority want to have done, and in doing it. It is only once in many centuries that a statesman like Pericles appears who has not only the art of executing the will of the majority successfully, but of easily winning the majority over to his way of thinking. So that the lesson which the politician of a free country has most constantly impressed upon him is the lesson of yielding, of compromising, of postponing indefinitely, of accepting not what he wants but what he can get, of often cheerfully going without anything at all in order to preserve his influence undamaged; the lesson, in short, that in a popular government strength of will is rather an encumbrance than a help. A politician who has not learnt this lesson hardly ever reaches any place of trust or profit, but passes through life with the reputation of an impracticable grumbler.

Now, Mr. Johnson has not learnt it, and yet, as he has often told us, he has passed through every office in the people's gift, from that of village alderman up "to the chief magistracy of this great country." It would not be difficult to account for this by an investigation of the society in which he has passed the greater part of his life. The simplicity, rudeness, and terrible personality, if we may use the term, of Southern life, and the unusually prominent part which mere passion plays in all slave societies, would alone furnish a sufficient explanation of it. He no doubt believes firmly that what he is now doing in Washington is showing strength of will, which he considers a very fine thing; but what he is in reality showing is simply a vindictive temper, which his political training does not seem to afford him the least assistance in curbing. His will is in reality very feeble, as was shown by the readiness with which he suffered Congress to set aside his "policy," and the hesitation he has exhibited in resisting any of what he considers the encroachments on his authority. The taunts or encouragements of his friends have at last driven him into action, but the action consists simply in what may be called the expression of spite against individuals. It is not at all likely that he hopes or intends through the removal either of Stanton or Sheridan to effect any real change in the government of the South, or change the terms of admission to the Union for the seceded States. What he does hope to do, and is pretty sure of doing, is to annoy a number of people who have annoyed him. That his policy goes no deeper than this—that, in fact, he is not capable of any deep policy at all—is, we think, abundantly proved by the scheme which he devised for bringing the impeachers to shame, and the nature of which has just been exposed. In order to throw discredit on them, he goes to a convicted perjurer actually serving out his sentence in jail, and perhaps the man least likely to be believed of any of whom the public has ever heard, and gets him to trump up a story on every word of which wild improbability is stamped, and gets the "Acting Attorney-General" to embody it in an official report, evidently in the belief that it will crush his enemies. Now, this is the act of an embittered and unscrupulous man, but it is not the act of a deep man; and no man whose bad passions find expression in this way is likely to be very dangerous. Mr. Johnson evidently is not the stuff of which great traitors or conspirators are made.

Nevertheless, though not a dangerous man, he is proving himself pre-eminently a mischievous man. He is mischievous in several ways. One is, that in the petty persecution on which he has now entered, he is likely to furnish several gentlemen with claims to the Presidency as "martyrs" simply, and which, if the Presidency were intended to be, or should be, the reward of simple suffering in a good cause, would be well founded. But the Presidency ought to be nothing of the kind. Mr. Johnson himself is the result of this mode of compensating martyrs, and it is generally admitted that he is not a satisfactory result; and in this time of confusion and uncertainty nothing can well be more unfortunate than the distraction of the public mind by candidates who owe their appearance in the field mainly to the fact that they have received persecution at his hands. Nobody can deny, for instance, the brilliancy and value of the services which both Sheridan and Stanton have rendered to the country; but then, when either of them is now talked of for the Presidency—and they both begin to be talked of a good deal—it is not so much because of the brilliancy and value of their services as of Mr. Johnson's hostility to them. In like manner, in the discussion that is now going on touching General Grant's claims, and which every day grows fiercer, his mental and moral qualities are treated as of secondary importance, the absence of hostility to him on the part of Mr. Johnson occupying the first place.

Another way in which Mr. Johnson is proving mischievous is in retrieving the reputation of the impeachers. It is not impossible that Congress may find itself compelled, if he perseveres in his present course, before it has done with him to go to extremes, and actually depose him from office. But Congress cannot do this without indirectly raising the reputation of the men who got up the impeachment cry a year ago, and who, as politicians, are perhaps as little qualified to inspire or direct a great public movement in troublous times as any set of men who have ever secured places in the government of a free country. In the wisdom or discretion of Messrs. Ashley and Butler the public has now little confidence, and we believe the success of such men in deposing the President, on such evidence as they have had to offer at any time during the last year, would have been a real misfortune which our children's children would have had cause to rue; and yet if Mr. Johnson has yet to be impeached or deposed, the effect will be to secure the impeachers a high reputation for sagacity and foresight, and to endow them with an amount of influence which, during the next year or two, they are almost certain to abuse.

Mr. Johnson is mischievous also in this—that small, feeble, and insignificant though he be, the precautions which it is necessary to take against him are likely to become precedents, and to lead to serious changes in the character of the Government. The powers which Mr. Lincoln was unavoidably allowed to assume during the war, combined with the goodness of his character, had the effect of greatly exalting the executive, and correspondingly depressing the legislature. It was his seeing these powers wielded by his predecessor that betrayed Mr. Johnson into the errors which have caused the present difficulties, and it is his assumption of them which has led to his being despoiled not only of his usurped, but also of most of his ordinary, authority. The executive, as Congress has now left it, is but a shadow of its former self, and should no reaction take place in the public mind, it will doubtless soon begin to seem useless to keep it up in its present condition. It would be absurd to pay an ordinary man, selected for almost anything but his wisdom, $25,000 a year, with a free house, for writing out his opinions on the affairs of the nation once a year in a message, and this is really all that the President now has to do. To be sure, he has still the power of "suspending" officials, but it remains to be seen whether even the exercise of this power under certain circumstances may not lead to his own deposition. We may be sure that if Mr. Johnson should be turned out of office either for suspending Stanton or removing Sheridan, none of his successors will ever exercise even this shadow of authority unless he has Congress overwhelmingly on his side, and if Congress has to be overwhelmingly on the President's side to enable him to exercise his functions, what becomes of the inde-

pendence of the executive, and why not abolish it altogether, and let the legislature do as the English Parliament does—elect its own prime minister, and turn him out when he fails to give satisfaction?

We are not finding fault beforehand with any measures which Congress, when it meets, may deem it advisable to take for the public safety. We feel quite satisfied, after all that has happened, that it will neither do more nor less than may be necessary. But we think it desirable that Congress as well as the public should remember that whatever is done with regard to Mr. Johnson will serve the purpose of a precedent as regards his successors, and that, therefore, the effect upon the structure of the Government of all steps taken in his case should be carefully considered. This is not a time to legislate under the guidance of enthusiasts like Mr. Stevens or Mr. Boutwell, or partisans like General Butler; and by enthusiasts we mean simply persons whose feelings overbear their reason, and by partisans persons who are more anxious for victory than for either truth or justice.

A SUGGESTION TOUCHING CONTRACTION.

The currency of the United States is depreciated. It requires to-day one hundred and forty dollars of legal tender notes to buy one hundred dollars in gold, and yet a greenback bears on its face a promise of the United States to pay a dollar—that is, 24¾ grains of gold—to the bearer.

If this is the promise of the legal tender note, why is it that one hundred and forty such promises must be given in exchange for one hundred of the dollars or actual coins, containing 24¾ grains of pure gold, which the United States promise to pay the bearer by the tenor of the note? The answer cannot be simply that there are too many greenbacks or legal tender notes. It would make no difference to an individual how many of such notes he held if he knew that he could get the gold for them, except that he would be the richer for each one held by him. Therefore the simple withdrawal of a certain portion of the legal tender notes, or the conversion of a part of them into bonds bearing interest and payable in gold at a certain definite time, would not of itself cause the remainder to bear a higher value in gold. The legal tender notes might be withdrawn by payment or conversion until their amount should be only one hundred million dollars, and yet they might still be at as great a depreciation in relation to gold as they now are, except so far as their withdrawal caused the number or quantity of tokens or measures with which the people pay debts and taxes to be insufficient for these specific uses.

The legal tender note has two functions or elements of value: First, An arbitrary value arising from the fact that it is used as a measure or token for the payment of debts and of taxes. Any man who owes a debt desires to get possession of a legal tender note because it can render him the service of discharging his liability; his desire is entirely independent of any gold or specie value supposed to be represented by the note. Second, The legal tender note has a value because it is a promise of the United States to pay to the bearer at a future indefinite time 24¾ grains of pure gold in the form of a dollar.

As to the first function, the Government may be said to have the power to *increase the value* of the currency by the withdrawal of a portion of it, precisely as the Government, by assuming a monopoly of the manufacture of yard-sticks and making an insufficient quantity, could increase the price of yard-sticks, especially if they also enacted that all cloth measured should be only measured by the use of yard-sticks. Practically the Government says to-day, We have created so many million measures of a dollar, and every creditor shall receive them in payment of any debt due him without any regard to the relation of these measures of a dollar to 24¾ grains of gold. To-day, with $400,000,000 of these measures in existence, their relation to gold is one measure to $17\frac{63}{100}$ grains of pure gold, but if by contraction the number of measures shall be reduced and the aggregate of transactions or of debts and taxes to be measured shall remain the same, then their *value as measures may increase*, or, in other words, their relation to gold may become 1 measure to 20 grains; but this will be an addition of value, not a correction of the depreciation of their absolute relation to gold.

The depreciation of the legal tender note is involved in the second proposition before stated. Gold and silver are the only uniform standard of value. The legal tender note promises to pay to the bearer 24¾ grains of gold. Why is it depreciated? Because no time is specified for the payment to be made. Would A. T. Stewart's note or John Jacob Astor's promise to pay the bearer 24¾ grains of gold be of any value if they did not fix a time on which they would pay the principal, or agree to pay interest? Aside from its function as a measure, the legal tender note is simply a bond, payable at the option of the promisor, bearing no interest. Has it any absolute value? Can it render any one a service? Will A, who owes no debt and means to owe none, and who, therefore, will have no use for the note as a measure, give a bushel of corn or a day's work for a piece of paper which will depend upon the indefinite chances of the future for its being worth 24¾ grains of gold?

The problem, then, is not only to increase the value of the greenback by decreasing the number of measures (of the manufacture of which the Government holds the monopoly)—or, in other words, to contract the currency—but also to correct the depreciation of the value of the promise of the Government to pay to the bearer 24¾ grains of pure gold for each paper dollar by giving to that promise the element of certainty; that is to say, to fix the date of payment. If this principle should be admitted, the methods would be comparatively simple. Given a surplus of revenue available for the payment of debt, the time or times at which the debt represented by the $400,000,000 greenbacks might be paid in gold can be fixed with safety. For instance, let the existing issue be called in and a new issue made, which should be legal tender but absolutely payable or redeemable at the end of ten years, such issue to be in classes of $50,000,000, each subject to be called in class by class at any time within the ten years. Then let the present issue be called in, and others issued bearing interest at the rate of two to four per cent. per annum, legal tender for the principal only, and absolutely payable at a given date. Slowly but surely, and safely, because voluntarily, would such notes be withdrawn from circulation and become absolutely valuable in gold as they approached maturity. Finally, let the present issue be called in and new ones issued, convertible after certain dates, or class by class, into 10-40 five per cent. bonds. Such conversion could create no crisis, because the moment the conversion proceeded so rapidly as to affect the rate of interest very much, the conversion would for the time cease.

In short, the analysis made of the elements of value contained in the greenback would seem to indicate that a certain date of payment should be fixed at such distance in point of time as to be practically safe, with such option for payment at an earlier date as might be found practicable, and also with such liberty given to the holders to convert them into bonds bearing a low rate of interest as would prevent the evils now caused by the enforced use of an exact and unvarying quantity of currency. We say enforced use, because owing to the absolute impossibility of conducting business without granting a credit (it may be only for a few days, but still a credit), and the absolute necessity for the creditor to receive in payment bonds bearing no interest as the representative of his capital, which was previously represented by the commodity which he sold, he must, in order to obtain interest, rent, or profit, buy some other commodity or property, and get rid of his bond.

As matters now stand, certain individuals or corporations are compelled to hold $400,000,000 of bonds bearing no interest as representative of their property. But no man will hold property which pays no interest, rent, or profit unless he is obliged to do so. Hence he seeks some other property with a hope or chance of gain on that, and therefore he becomes a speculator in spite of himself. Give him the option of a long, safe bond at a low rate of interest. Can the community suffer as a whole if certain individuals take this option? The community will have to pay the additional tax to meet the interest, but it will secure the gain of that increased product of all the commodities for which men work which all men admit to be the result following from the establishment

of a currency of fixed value—that is, a currency bearing a certain and definite, and not an uncertain and indefinite, relation to gold and silver, the two products or results of human labor which have become established by the world's use as a standard of value by which men may exchange services or measure their labor as compared with that of others.

FEMALE SUFFRAGE AND EDUCATION.

In spite of Mr. Curtis's eloquent and forcible speech, it is plain that the women of New York are not about to receive the electoral franchise from the Convention at Albany. The prejudices of men in favor of the seclusion of the other sex are still too strong, supported as they are by the indifference of the mass of women themselves. Although numerous replies, some of them amusing enough, have been made to Mr. Curtis's argument, it has not been answered by any one. The chief ground of opposition to it is purely sentimental. Drag not the purity of women into the mire of politics; leave her to the sacred quiet of home; let her find her full development in the duties of the household; let her exercise her gentle but omnipotent sway with other instruments than the ballot; "unsex" her not by bringing her into rude contact with man; she requires protection; she desires not to enter into the hard struggles of life; keep her veiled and apart; such is the ordinance of heaven, such is the eternal law of order. But this is a mere oriental plea. The Turk will not allow a woman to appear unveiled in the street. The Hindoo regards it as the height of immodesty for a woman to be seen walking arm-in-arm with her husband; the proper place of the woman is behind the man. The Chinese insist on bandaging her young feet so that she shall never walk comfortably. Only in this way is the sanctity of the sex to be preserved; only thus can her true place in the social order be secured to her. Our delegates at Albany are still Chinese in their notions. We must cramp the feet of our women; we must keep them veiled for twenty years to come at least. They do not object. They are lovely and powerful because their feet are cramped. If we let their feet grow according to nature, they will become "unsexed," we shall have frightful domestic difficulties, and all sorts of trouble in the State.

But if these are the strongest arguments that can be brought against female suffrage, it is plain that the question has reached such a point that the settlement of it on a right basis cannot be long delayed. Mr. Curtis is not in advance of the better feeling and the better reason of the time. The moral judgment of the more thoughtful portion of the community is already convinced that it is not only right but wise that woman should take her place as the political equal of man; and long-held, inherited prejudices are giving way before the force of reason and the strength of will of those who believe that man has no more right to deprive woman of her share of control of the affairs of state than woman would have to deprive man of his; of those who believe that there is nothing essentially unfeminine in interest in public matters, and that the true relations of the sexes and the just influence of woman are not reached while woman is only virtually represented in our public councils. There is little risk in the prophecy that, if women choose, the next constitutional convention that meets at Albany twenty years hence will hasten to grant to them the right of suffrage, and will feel very little trouble as to its tendency to "unsex" the mothers and sisters, the wives and daughters of the State.

The doubt then will be not in regard to the effect of the franchise upon woman herself, or to her capacity for exercising it beneficially, but, as in every other question of the extension of the suffrage, whether the education of the class seeking it has fitted the generality of the class for its wise exercise. And in this as in every other case, the doubt must be met by considering the exercise of the right itself as an educational process. By the possession of the right to vote, and by the exercise of it, the mass of women will be made as fit to vote as the mass of men are. This fitness is not, indeed, of any high degree. The mass of men have no occasion to boast of any natural capacity to vote wisely. Universal suffrage is good and safe only in proportion to the intelligence of the community. It is but to repeat a familiar truism, which, however, loses no force through triteness, that education, meaning the cultivation of intelligence and character, is the only safeguard and secure foundation of a democracy in which universal suffrage prevails.

It is not less true that women, as a rule, have been, and still are, less well-educated than men; that their intelligence and character are proportionately less developed by the instruction they receive. The first effort of every woman interested to obtain the full equality of women with men, due regard being paid to the difference of sex and to the consequent difference in some of the functions of life, as well as the first effort of every man desirous not only of doing justice to woman, but of uniting her full power to his for the improvement and elevation of society, so that she may take her due share in the progress of civilization, should be to improve the method and to increase the means for the education of women.

It should be an invariable and fundamental political rule in America that every extension of the elective franchise should be accompanied with or preceded by an increase of the means of popular instruction. Our common-school system by no means fulfils all the need. In the State of New York itself there are many thousand children for whom the State has not provided sufficient or suitable school accommodation. Many of our school-houses are utterly unfit for their purpose, and even unprovided with the first requisites for mere decency. Now, even if there were no prospect of the admission of women to the suffrage, this state of things ought not to be allowed to continue. It is disgraceful, costly, and dangerous. Where the schools are few and cheap, the jails are many and costly. But with the prospect, however distant it may be, of so great an addition to the number of voters, the demand for better provision for the education of women as well as of men becomes urgent. The Convention has no more important duty to perform than to devise and provide remedies for the defects of the existing system of popular instruction in the State, and to adapt it to the actual wants of the time. Two things are required which demand a degree of courage that the Convention, composed as it is of men who are compelled to regard party interests, may not possess. First, every community forming a school district should be required to provide sufficient and suitable school accommodation for every child of the school age in the district. Second, education should be made compulsory. The State has a right to insist that after providing the means for the instruction of every child those means shall be used; it is its duty, moreover, to protect itself, or, in other words, the community at large, from the evils and dangers to which it is exposed by the neglect of individuals to make use of the means provided for the instruction of their children. The particular method of compulsion, whether by fine of the parent or a tax levied by the State on each school district in proportion to the number of children absent from school during a term without excuse, or whatever other mode, is of comparatively little importance, provided only it be efficient. The object is to allow no child, no future voter, to grow up without such instruction as may enable him to learn to vote intelligently. If the State does its duty in the matter of education, there need be no fear of the consequences of the admission of women to the elective franchise. Neither the State nor women would suffer. If women were properly instructed, they might—we see no reason to doubt that they would—vote as intelligently as men; and with education and equality of political right, instead of losing loveliness and womanliness, they would, if we may trust to the lessons of past experience, grow more and more lovely and worthy of love, become more truly feminine, and be no longer the toy and the plaything, but the equal helpmate of man.

HINTS FOR CONSTITUTION-MAKERS.

BY A JUDGE.

II.—The Suffrage.

Until the beginning of the rebellion there were few men (not professional politicians or office-holders) who took a warmer interest in, or did more work for, the Republican party than the writer of this article. As a practical, though not professional, politician, I gave the question of suffrage some attention, and now venture upon an assertion that will occasion some surprise, but which, nevertheless, I believe to be

materially, if not literally, true—and it is this: Before the war nine out of ten respectable citizens were secretly in favor of a small property qualification—not, however, as a property representation, but to elevate the suffrage and to secure a less corrupt system than that which swayed and carried our elections. And what is strangest is, that this feeling was strongest among the very men who buy and bargain for votes, justifying always their acts by the emergency of the present case and the corrupter practices of the opposing party, but always regretting that men holding the "privilege" which is both a right and a trust, "should be bought and sold like sheep." This feeling grew strong enough to call forth a proposition that the suffrage be restricted to those who could read and write the English language, and to gain one practical advantage in the enactment of the registry law. It was, however, but an eddy in the stream, for there was a great current setting in the opposite direction, bearing men along against their own convictions, making them speak and vote against their secret wishes, and carrying them resistlessly toward one great principle, which may be defined in the single name of MANHOOD SUFFRAGE.

The Anglo-Saxon race, if not the world, has been steadily advancing toward this end for centuries, and the people of the United States have about reached it. I deem it as certain as any future fact can be, and, therefore, not a subject for discussion here. But when that goal of the great race is reached, there will come what some men will call a reaction, but which, in fact, will be a new movement toward a principle, inferior but only second to the other, without which no system of representation is complete, and that is the *co-ordinate representation of property*.

It is not a new principle that taxes shall be imposed only with the consent of those who bear them. It was the moving cause of *Magna Charta*, of the Bill of Rights, of the Declaration of Independence. It was established at Runnymede and re-established at Bunker Hill. Whenever it has been violated, the violation has roused up the resistance of the sturdy race whose resistance expires only with success, and, whether in America or England, the principle always in the end has been triumphant. It may not be an agreeable fact to contemplate, but nevertheless the State of New York has, in this particular, gone backward, and travelled toward the barbarism of England before her great charter. Whether it is the class above or the class below which imposes a tax without the assent of the taxed, can be of no practical importance so long as the tax is imposed and collected against the consent of those who pay it. Of late years there has been a steady usurpation upon the rights of property, beginning in the great cities and slowly extending throughout the State. Thus, in the city of New York the tax-payer is without power and without representation. The men who impose upon his property the *local* tax, are either the representatives of the non-tax-paying rabble of the city, or the representatives of other tax-payers in other counties of the State. That he has the privilege of throwing his vote against the five votes of his non-tax-paying opponents—that the members of the Legislature are the representatives of the whole State, and hence his representatives, are pretty theories, but of no practical value so long as his property may be voted away by men who neither share in his burden nor can be reached by his vote. If every tax-payer in the city of New York should vote against the imposition of a local tax, the Common Council and the State Legislature might still impose it. Is not this a return to the barbarism of the Middle Ages? King John sought to do nothing more.

The remedy is some centuries old, and has worked well. In a land where the oppression came from above, it required that the tax should be imposed only with the consent of the "Commons;" but it is not material whether the consent be given by the one house or the other, so long as those who bear the burden of taxation are secured the right of representation. Those who contribute the cost of government have a peculiar interest in the government which those who do not contribute anything do not share. It may not be the work of this Convention, but I think the time will come when every person who contributes a part of his earnings to support and carry on the machinery which works for the common welfare will be allowed to vote in his or her true character of tax-payer without regard to *sex* or *color* or *nationality*—when, in short, the tax-list will be, for one branch of the Legislature, the poll-list, and when all who have paid their share of the common expense shall be maintained in the right of being represented in the government.

The want of this protection has been felt in a manner hardly observed by those who will oppose it. Capital has few votes, and it therefore resorts to the only means which it possesses—*it corrupts*. It does not approach the Legislature with mass meetings or processions, but by insidious agents and degrading influences. It justifies this crime by the old rule of self-preservation. It fights superior numbers with its only arms—money. So long as it is left defenceless, it will of necessity corrupt. No statutes, no constitutional provisions, will ever stop its dangerous progress; the evil will exist while the cause continues.

If this principle could be engrafted on our constitution now, it would disentangle several knotty questions. It would satisfy the only valid demand for female suffrage. It would restore the independence of the great cities. It would elevate and dignify one branch of the Legislature. It would diminish the clashing and facilitate the true compromises between capital and labor. It would assure the foreign capitalist and secure the benefits of foreign capital. It would prevent a long and angry contest, wherein the principle, as heretofore, will be victorious.

THE POLITICAL DECLINE OF THE "PERFECT GENTLEMAN."

WE drew attention some weeks ago to the increasing predominance in politics of the "self-made men," and of the evolution from them of a new type of statesmen wanting in nearly everything which has from the earliest ages been supposed to be essential to the statesman's character except honesty; but we did not attempt on that occasion to account for the phenomenon. We do not now propose to offer anything like a complete theory of the change; we wish simply to call attention to what we consider one of the most powerful of the many causes which have helped to bring it about, namely, the decline in popular estimation, mainly owing to his own misconduct, of that well-known personage—the Perfect Gentleman. The services which he rendered in the earlier period of the history of the Government were inestimable. He bore a leading part both in the Revolution and in the formation of the Constitution, and, until within the last twenty or thirty years, filled many of the most prominent places in the National Government. In most political contests his chances were considerably better than those of the Poor Boy or the Self-made Man.

We repeat that we do not mean to ascribe his subsequent loss of influence solely to his own degeneration. A variety of circumstances, social as well as political, have contributed to his fall; but the leading one has been unquestionably the decay in his own mental and moral condition, which began to reveal itself when the slavery question forced its way into politics. During the Revolution, and long after, he displayed considerable activity and receptivity of mind, and in his discussions of political questions he generally showed himself in advance of his age, and ready to entertain new ideas. He revealed, in the part he took in public affairs, both a high regard for morals and a strong belief in progress, although he was decidedly conservative in his social tastes and habits. He prided himself considerably on his gentlemanhood, was particular about the company he kept, the clothes he wore, the food he ate, and the manner in which it was served; but then he had a tolerably hearty sympathy with attempts to improve the condition of the race; he believed in its capacity for improvement; he looked forward and not backward; and he still retained strong traces of the creed of the old feudal gentleman, which made the good cause the gentleman's cause, the weaker side the gentleman's side; which made courage the first of his virtues; distinction, and not uniformity, the great object of his ambition; which, in short, was summed up in the formula—*noblesse oblige*.

For some reason or other a great change came over him about thirty years ago; we mean over the Northern variety of him. He renounced his belief in human progress; he lost no opportunity of making known that he thought the world was as good as it was ever going to be, and yet he admitted that as it stood it was a most rascally world. He began to maintain that politics, although a science the knowledge of which was entirely confined to himself, was a science in which no further progress was possible; and though a lineal descendant of the authors of the Declaration of Independence, he betook himself to Aristotle and Sir Archibald Alison, with whose works he declared the canon of political revelation to be closed. He began, too, to get somewhat ashamed of his country, and to affect either the Southern or

European in his tastes, habits, and ways of thinking. When he took the European for his model, he usually eschewed politics altogether and passed much of his time in France and England. Here he dressed with great care, and excited the deepest interest in good society as a man whose refinement had driven him from his home, his paternal mansion being uncomfortable to him by the bad behavior of his democratic neighbors.

When he took the Southerner for his model, he usually got himself up in Tory sociology, and acquired as much ethnology and physiology as was necessary to enable him to fix the negro's place in nature, and cultivated submissiveness and conformity with great industry. He treated his Northern birth as a misfortune, and bore at Southern dinner-tables, and often at his own, with as much abuse of his birthplace and neighbors as anybody thought it worth his while to pour forth upon him. He always travelled in the South with a liberal stock of "Southern principles," which generally meant the absence of any principles whatever of his own, and readiness to accept those of the locality in which he happened to be sojourning. He gradually but rapidly lost all interest in political science, and fell into the habit of considering the Constitution of the United States a complete political revelation, furnishing the citizen with an infallible guide in politics as the Bible did in religion, and the main object of the Constitution he constantly declared to be the prevention of attacks on Southern slavery at the hands of the Northern Democracy. His interest in religion, however, at the same time grew steadily, and he opposed a firm front to the Comtists and the German neologists, but he was very ardent in his hostility to political preaching. All military spirit died out in him. The few signs of it which occasionally appeared took the form of the expression of a desire to put down slave insurrections or fight abolitionists, but then there was nothing very terrible about this, as he was never tired of ridiculing the cowardice and poltroonery of both of these classes of enemies. He last occupied the Presidential chair between 1852 and 1860, and during the whole period conducted himself with such a shocking want of manliness, courage, and truthfulness that good clothes and polished manners got to be associated in the popular mind with moral turpitude and mental imbecility. His messages and other political compositions were long, wearisome bundles of platitudes, to the composition of which either the Poor Boy or the Self-made Man was fully equal, but would for many reasons have been ashamed to write.

When the war broke out the Perfect Gentleman was at his wit's end, and reeled to and fro. If he had known which side was going to win he would have declared for it at once, but it required considerable familiarity with political principles and considerable skill in observation to ascertain which side this was; and as he had long ceased to give any attention to principles, and had no practice whatever in observation, he was for some months in a perfect quandary. He at first took command of the army, with the intention of conducting the war on a plan of his own, which he said was that of the great masters, and the leading features of which were tenderness for the enemy and rigid respect for etiquette at headquarters; but the public, after being taken in by this plan for a little while, got angry and dismissed him. He then retired into private life, and spent his time partly in the country, partly in Europe, supplying thrilling stories of democracy to the European press, and writing letters and pamphlets against the War Power and Emancipation, and studying the Book of Revelations, abusing Abraham Lincoln's manners and clothes, and predicting the triumph of the Confederacy. About this time, also, after having for many years followed in the footsteps of the Sage of Marshfield, he formed a fellowship with the Sage of the Bloomingdale Road—the Honorable Fernando Wood—and combined with that eminent publicist, the Honorable Auguste Belmont, in issuing monarchical tracts on the divine right of slavery, under pretence of diffusing "political information."

Since the war, he has gone through considerable mental suffering, but as yet there are no signs of any great improvement in the state of his faculties. He made a feeble effort to appear pleased when Lee surrendered, but it was impossible to make out whether it was the triumph of the Government or the cessation of bloodshed which gave him most satisfaction, for we omitted to mention that the war, instead of hardening him to slaughter and suffering, seemed to unseal the fountains of his tenderness, and caused him to weep over nearly every battle, no matter which side won. Negro suffrage has worn on him horribly, but not so much because of the ignorance of the negroes as from a fear that they will get into "the marriage bed" and attend his evening parties without invitation. He is also somewhat afflicted by the woman's rights agitation, but rather on grounds of taste than expediency, and in fact now regards nearly every public question from a purely sentimental point of view.

The condition of the national finances is just now occupying his attention. He has begun to declare his views upon it at the West. He proposes that the five-twenty bonds should all be paid off in greenbacks instead of in gold, a new issue being made for this purpose; or, in other words, that we should settle our debts in the same ingenious manner as Mr. Wilkins Micawber used to settle his—by giving our notes payable at some remote and undetermined period, without interest, and reserve to ourselves the power of putting out as many of them as we please. Not that he means to "repudiate;" he is a good deal too honorable for this. He means simply to pay in a commodity which will cost us nothing and be of little or no value to our creditors; and he thinks that by industry and economy, and a strict disregard of the obligations of morality, we may yet be a happy and united people. It is hardly necessary to say that this sort of thing is far above the comprehension of the common people, who have, therefore, in despair given the Perfect Gentleman up as a political failure, and just the least taste in the world of a knave.

PARIS GOSSIP.

PARIS, July 25, 1867.

WHILE the press and public of this city are endeavoring to discover the secret political aim which they imagine must have prompted the brilliant demonstration of which the Belgian Volunteers have just been the object across the Channel, majesties, highnesses, and grandees of every number of buttons continue to arrive here "plenty as blackberries;" and Mlle. Schneider, whose triumphs as the heroine of Offenbach's merry farce seem destined to indefinite prolongation, and who has received the homage of so many crowned heads that she is in some danger of taking her rôle *au sérieux*, has just taken advantage of the constant succession of high-sounding titles at the doors of the Exhibition to play off a little trick whose success has greatly amused and gratified the Parisians. Superbly dressed, and attended by a party of ladies and gentlemen got up in similarly overwhelming style, she alighted at one of the entrances from a magnificent carriage, a few days since, and had herself announced as "Her Highness the Grand Duchess of Gerolstein," an announcement which, of course, created a lively sensation among the policemen there assembled. Accompanied by a stately-looking personage, wearing the green and yellow ribbon of some imaginary order, and followed by the people of her court, the "Grand Duchess" swept in with all the dignity befitting her rank, amidst the profoundly respectful and admiring salutations of the double row of officials who had hastily formed in line to give a suitable reception to so great a lady, and whose salutations she acknowledged by a series of graceful bends of the head that charmed all beholders. But for the resolute refusal of the prime minister, who, while thanking them, in his sovereign's name, for the intended attention, assured them that it was her highness's pleasure while in the building to maintain a strict incognito, they would have organized a detachment of their body to attend her during her visit.

It is now known that the Sultan, though he did not extend much patronage to the shops of Paris, made large purchases at the Exhibition, where, among other things, he bought the entire display of one of the great French glass manufacturers, his order being coupled with the condition that everything should be delivered at the Elysée on the following morning. The manufacturer, with an army of professional packers, spent the night in the building, working to such purpose that, by the appointed hour, the magnificent chandeliers, dishes, vases, dinner services, etc., were all packed and delivered and their places filled with objects so similar that the public had no suspicion of the substitution.

The Queen of Prussia has come and gone. Her first visit at the Exhibition was to the display of the International Society for tending the wounded on the field of battle, and showing the methods and appliances adopted by its members in the carrying out of their work of mercy. The formation of the society in question was suggested by the successful development, on the part of the Sanitary Commission of the United States, of the attempt, first made by Miss Nightingale of Crimean fame, to organize lay help in mitigating the inevitable horrors of the battle-field. It is now placed under the patronage of all the principal governments of Europe, and under the personal protection of several of the sovereigns, among whom the King and Queen of Prussia have been especially cordial in their manifestations of approval and interest. To testify her interest in the aims of the society, the Queen wore, on her visits to the Champ de Mars, the white ribbon with a red cross which serves as the distinguishing badge of the society—which marks, let us hope, the achievement of an appreciable step on the road to "the good time coming" when the people of this slow-to-learn little planet shall have discovered that there is something better to be done in the world than fighting.

An event which also marks, in its way, the substitution of new ideas for old ones is the abolition of imprisonment for debt, accomplished by a recent decision of the Senate and the Legislative Assembly, and in consequence of which the doors of the classic temple of impecuniosity have been thrown open and the inmates of the debtors' prison of the Rue de Clichy have just been set at liberty. The law abolishing imprisonment for debt having been finally passed, after a protracted debate, at half-past twelve at night, and its provisions becoming executable twenty-four hours afterwards, the doors of the Clichy prison remained closed until the recurrence of that hour on the following night. The progress of the bill had been followed with eager alternations of hope and of fear by the hundred and ninety-seven unlucky mortals (three of them women) who had been confined within its walls for longer or shorter periods, and who used to read aloud, day by day, the debates whose conclusion would have so important an effect on their future. The excitement of the prisoners on learning that the bill had passed, and that they would be set free in the course of another twenty-four hours, may easily be imagined. They laughed, wept, rushed into one another's arms, hugging and kissing each other in true French style; leaped, danced, tossed up their caps, sang and shouted in a delirium of delight. "I shall see my wife and children!" "I shall make my fortune!" "I shall see the Exhibition!" "I shall have a walk on the Boulevard!" "Vive la liberté!" "Vive l'Empereur!" resounded throughout the building. The prison authorities made some little addition to the dinner, after which the prisoners went in procession through the building, each carrying a lighted candle. These candles were then stuck in the windows, and while this modest attempt at an illumination was burning itself out, the inmates of the place employed themselves in making their bundles ready for their approaching exit. Exactly as the clocks struck the half hour after midnight, the doors of the prison were thrown open, never to close again upon "debtors," and one hundred and ninety "poor devils" passed out into personal freedom. It appears that the noisy excitement of the earlier portion of the day had died away as the hours wore on towards midnight, and that the exodus was performed very quietly, most of the company expressing their satisfaction that their departure was to be effected under the cover of the night instead of by daylight, in which case a crowd would certainly have gathered to see them go. Seven of the prisoners—philosophers, doubtless, in their way—preferred sleeping in the building, and only quitted it next morning at seven o'clock.

According to present appearances there would seem to be a chance of the world's being treated, ere long, to a lawsuit the like of which has probably never been seen. Your readers, no doubt, have not forgotten the strange stroke of fortune by which Mr. Daniel Home, so well known to fame for his claims as a "medium," was suddenly adopted and enriched by a wealthy old Englishwoman, a widow named Lyon, who gave him £30,000 down, made him take her name, and presented him to her lawyers, bankers, and acquaintances as her adopted son. The sum first given to Mr. Home by Mrs. Lyon, and a second sum which she gave to him shortly afterwards, were part of a sum of £90,000, in consols, which resulted from the accumulating interest, during over half a century, of a sum of money possessed by her before she married, and which her husband had always declared to be her own particular property. It seems that Mrs. Lyon, being an illegitimate child, had always been treated coldly, and even unkindly, by her husband's family, who, rich and proud, resented what they considered as a *mésalliance*. The old lady, therefore, openly declared her intention of leaving all her large fortune, including about £200,000 that had been bequeathed to her unconditionally by her husband, to her adopted son. But this intention appears to have been combated by Mr. Home's friends, who counselled her strongly to leave to her husband's family the portion of her property which she had received from him, and to let whatever provision she felt inclined to make for her adopted son be taken exclusively from the property that had been hers before her marriage. Mrs. Lyon, in making her sudden gift to Mr. Home, whom she had only once seen, and who was made ill by the suddenness of the change thus operated in his position, stated to him, and to all about her, that her deceased husband had appeared to her, and had told her that he wished her to adopt Mr. Home, to give him a handsome income, and to regard him in all respects as her son, the support and companion of her old age. Mrs. Lyon, it should be stated, has long claimed to be a "medium" and taken an active part in the so-called spiritual movement of the day. But though thus stating herself to be *en rapport* with the invisible world, she frequently avails herself of the aid of other "mediums," and thus has made the acquaintance of a young girl who not only professes to be in communication with "good spirits," but declares Mr. Lyon (as he has been called for a year past) to be in communication with "bad" ones. Mr. Home's health being exceedingly delicate, his adopted mother took him, a few months ago, to the coast of Devonshire, for change of air; appeared to devote herself to him with great affection, and wrote to him, whenever she left him, the most affectionate letters. About six weeks ago, urged to the step by the representations of the young girl referred to, Mrs. Lyon suddenly informed her adopted son that she cast him off, and must have her money back; that the "spirit" which had caused her to adopt him was "a lying spirit" whom he had sent to deceive her with the semblance of her husband; and immediately afterwards caused him to be arrested and thrown into prison on a charge of being about to leave England with money fraudulently obtained from her. Mr. Home's friends, informed of what had taken place, liberated him on bail, and he was removed, more dead than alive, to the house of one of them, where he has been nursed and doctored, and where he still remains.

Mrs. Lyon's bestowments on Mr. Home having been *bonâ-fide* gifts, it appears that unless the latter voluntarily gives them back to her she can only act against him by throwing the whole affair into Chancery, and proving that she has been the victim of fraud and "collusion;" and as Mr. Home is understood to refuse to relinquish these gifts—as such a relinquishment, say his legal advisers, would be equivalent to an admission of the justice of her charges against his friends as well as against himself—this curious affair may possibly be brought before the world by a regular legal procedure, in which case it is said here, by parties well informed of what is going on in London, that such an array of "respectabilities" will probably come forward to declare their conviction of the reality of the "phenomena" which would form the most prominent feature of the case as will suffice to place the expected lawsuit in the front rank of "*causes célèbres*."

Correspondence.

WHO IS RESPONSIBLE?

To the Editor of The Nation:

I have been longing, ever since I read your article on "Female Influence," for a leisure moment in which to make a few observations to you about it.

I presume it was written by some crusty old bachelor, who never knew the delights of having a wife to dress in ribbons and gauze, "rings and farthingales and things;" and as I am an old maid who never knew the happiness of having a husband to waste the fruit of his toil on me, I think myself the right person to say a word in reply to his severe strictures on my sex. By the way, what a fuss we are making just now! It is well my mother is dead; she would have been ashamed to see so much in print about her sex.

I will consent to the truth of a great part of what is said in the article to which I allude. I confess that women are foolish, trifling, vain, and fond of dress, guilty, in short, of a great many weaknesses over which I daily lament, but then *à qui la faute?*

I contend that men are at least as much to blame for this state of things as women, and that the remedy is in *their* hands. So long as they allow themselves to be captivated by showy dress and pretty little frivolous ways, women will continue to cultivate such; and just as soon as they manifest a preference for something higher and better, women will alter their standard. An impression exists very generally among women that anything like "strongmindedness," any disposition to think and act for themselves, will be an effectual bar to their matrimonial prospects; and certainly appearances would seem to justify such a conclusion.

Why is it that the most intellectual men almost invariably choose pretty little doll-like women, utterly incapable of being companions to them, except in the most limited degree?

Why is it that a sensible woman like myself, for instance, who have never sought to win any man by dress, or by any false pretences, yet who am conscious of capabilities of no mean order of making others happy, have been left to reach the verge of my fiftieth year, unsought and unadmired? Why, but because of the want of right appreciation in the sex who now come forward to charge us with levity and folly!

Don't imagine, dear Nation, that I speak regretfully of my lot; on the contrary, I see more and more reason to be satisfied with it.

So long as men choose their wives as they do, I don't want to be chosen! (I forgot just then how old I was.) I could say more, but having heard men accuse my sex of being garrulous, I will refrain. Pray do me the favor to give these few lines a place in your columns, and forever oblige

Vieille Fille.

PARKMAN'S JESUITS.

OPINIONS OF THE PRESS.

"To other most important qualifications for his task, Mr. Parkman joins a simple, forcible, pleasing style of composition, and uncommon skill in the grouping of the incidents which he has to relate."—*New Englander.*

"A work we can commend as one more absorbing than a romance, and equalled by few histories in graphic clearness and power of commanding the reader's sympathy and confidence."—*Round Table, N. Y.*

"The result of these painstaking efforts is shown in the production of a work which is likely to remain a standard authority. . . . The reader once beginning this narrative will read to the end. The picture is strikingly painted, and the interest always sustained."—*N. Y. Evening Post.*

"By this admirable volume the author has made all American readers more than ever his debtors."—*Philadelphia Inquirer.*

"A picture of the past, fairly rivalling the histories of Prescott, both in originality of research and admirable simplicity and purity of style. It has a charm of personal narrative about it such as few works of the kind possess."—*Philadelphia Ledger.*

"As we are borne along with the rapid movement of a narrative which kindles the blood, and fills the imagination as well as informs the understanding, we forget with what toil the materials for so consecutive a story must have been collected and arranged; but the research implied in every glowing chapter of Mr. Parkman's volume would alone have been sufficient to give him a deserved reputation."—*Boston Transcript.*

"Mr. Parkman's descriptions of Indian life are unsurpassed by anything of the kind. Few subjects are more attractive than the one upon which he is laboring, and, for the success with which he has thus far treated it, he deserves to be ranked with Prescott and Motley."—*Boston Advertiser.*

"M. Parkman possède un style pur et plein de charme; il narre avec chaleur, et trace les caractères de main de maître. En bien des endroits il rappelle l'écrivain américain Prescott."—*Journal de Quebec.*

THE NEW MAGAZINE.

THE BROADWAY.

AN INTERNATIONAL MAGAZINE.

The projectors of THE BROADWAY feel satisfied the time has now arrived when a closer connection in literature should exist between the Old and the New Worlds. We have had and are having International Congresses and International Colleges, International Coinage and International Exhibitions, all of which contribute to drawing closer the friendly bonds of "the fellowship of the nations," and now we are to have an International Magazine to help them in their good work.

It is the design of THE BROADWAY—which name may be taken as synonymous with the metropolises of the two great Anglo-Saxon nations, Great Britain and America—to draw together the literary caterers of these two nations in a magazine that will acknowledge the right of each author to the product of his brain in both countries. The editor will receive and insert papers from both sides of the Atlantic, without regard to nationality, the only requisites being that the articles be written in good English, that they be entertaining, recreative, and *light*, that is to say, they should be sociable without being frivolous, and, if they aim at being instructive, they must be such as can be easily digested. The papers may be on any subject save politics—politics being dull things, we eschew them.

The writers may be of any creed or class. Laymen and clergymen alike are invited to say their say in THE BROADWAY, if such be said in good English and in few, well-weighed words.

Arrangements have already been made, and others are being made, with some of the best literary caterers of both Broadways and Nations; and as an earnest of what readers may expect, we append a few of the names set forth by THE BROADWAY of London. In due time THE BROADWAY of New York will set forth the list of engaged writers on the western side of the Atlantic; but in this, as in other things, the Magazine may be expected to speak for itself.

Among the engaged writers set forth by THE BROADWAY of London may be named: The Author of "Guy Livingstone," Rev. J. C. M. Bellew, Robert Buchanan, Leicester Buckingham, F. C. Burnand, Henry J. Byron, Amelia B. Edwards, W. W. Fenn, Dr. Fennell, Percy Fitzgerald, J. Hain Friswell, Ernest Griset, John Hollingshead, Tom Hood, Charles Knight, Samuel Lover, Thomas Miller, John Oxenford, Dr. Peard, Professor Pepper, Mrs. Riddell, W. H. Russell, LL.D., George Augustus Sala, Arthur Sketchley, Hesba Stretton, W. B. Tegetmeier, W. Moy Thomas, and Edmund Yates.

TERMS:

THE BROADWAY will be published monthly, at 25 cents; each monthly part will contain eighty octavo pages of letterpress, and two or more full-page illustrations, printed on toned paper. The yearly subscription for single copies will be $3; two copies, $5 50; three copies, $7 50; five copies, $11 25; and $2 25 to each subscriber in clubs larger than five.

Address the Publishers,

GEORGE ROUTLEDGE & SONS,

416 Broome Street, New York.

25 CENTS A MONTH; $3 A YEAR.

THE BROADWAY,

FOR SEPTEMBER, 1867,

WILL CONTAIN:

1. BRAKESPEARE; or, The Fortunes of a Free Lance. By the Author of "Guy Livingstone." (With a full-page Illustration by G. A. Pasquier.)

   Chapter I. Twenty Years Back.
   II. Matched, Not Mated.
   III. The Working of the Rescript.
   IV. The Breeding of the Bastard.
   V. Anu Hagarene.

2. CHARMIAN. By Robert Buchanan.
3. DRAMATIC CRITICS CRITICISED. By John Hollingshead.
4. A WONDERFUL CRAB. By Ernest Griset. (With Eight Illustrations.)
5. WILLIAM CULLEN BRYANT AND AMERICAN POETRY. By W. Clark Russell.
6. FLO'S FATE. By Clement W. Scott.
7. HOLLAND HOUSE. By Rev. J. C. M. Bellew. (With a full-page Illustration by R. C. Hulme.)
8. FALLING IN LOVE. By the Author of "The Gentle Life."
9. IN THE SEASON. By Edmund Yates. (With a full-page Illustration.)
10. ENGLISH STABILITIES. By Rev. C. W. Denison.
11. SECOND THOUGHTS. By F. C. Burnand.
12. AMARANTH. By Savile Clarke.

The Week.

THE publication of the correspondence between the President and General Grant sets at rest all doubts as to Grant's opinion of Mr. Johnson's conduct, and thus relieves him of much of the odium which a portion of the Radical press have been heaping upon him ever since he took Mr. Stanton's place. But his position as cabinet minister of a personage whose policy he disapproves, and as the political medium of orders which he believes injurious to the best interests of the country, is, as we remarked last week, a false one, and we are exceedingly sorry he ever got into it, and hope he will speedily get out of it. It is desirable, for reasons which will probably be more apparent six months hence than now, that the head of the army should be free from all "entangling alliances." The best service every good man can render the country is to leave Mr. Johnson to his own devices. Nobody is capable of patching him up or making him look respectable. Mr. Seward has been cobbling him for two years, and the result is total failure. A piece is no sooner put on him in one place than he breaks out in another. There appears little doubt that he is now determined to bring on a conflict with Grant himself. The situation, it must be admitted, is exceedingly grave.

Mr. Johnson has fairly determined at last to cut the Republican connection, and set up as a genuine Copperhead of the olden time, "with the Constitution for his guide." As we write, the resignation of all the members of his cabinet is said to be at his disposition. Even Mr. Seward is going at last—his journeyings and feastings and speeches and celebrations with and for and on behalf of the said Johnson going for absolutely nothing. This course, as we understand, has been long urged on Mr. Johnson both by the members of his own family and by his most intimate political friends; but he has never been able to screw his courage up to the sticking-point. Their taunts and entreaties have at last set his native pluck fermenting, and it has acquired volume enough for the work. His programme now apparently is to execute the law in appearance, but execute it through instruments of his own choosing, not in sympathy with it or with Congress, and execute it in such fashion that it shall do as little damage as possible to Southern ideas. His letter to Grant reveals clearly that his opinion still is that he may not only take the Constitution for his guide, but interpret it for himself, and that he is even, in supreme crises like the present, a co-ordinate branch of the Government not in form only, but in fact; and he evidently believes that there is some mysterious virtue in the parchment of the Constitution which will shield him from harm, no matter how popular feeling may run. He is, we should say, in a state of mind very similar to that of the Turkish merchant captain who was despatched in 1847 from Smyrna, by a Greek house, with a cargo of corn for Marseilles. He did not make his appearance in due course, and the consignors heard, after two months, that he was snugly anchored near Cape Matapan, the southernmost point of the Morea, where he had been for four weeks. They went in pursuit in a steamer, boarded him, and found him squatted on his quarterdeck smoking, and apparently happy. On being asked what kept him there, he said he had sailed as far as his chart went, and there was then nothing for him but to stop; and in reply to the question how long he would have remained there, he said "Allah only could tell." Mr. Johnson has got to the end of his own chart, and there he intends to stick as long as his employers will let him.

There appears good reason to believe, we are sorry to say, that General Thomas was appointed to take General Sheridan's place either with the knowledge that Thomas was ill and could not take it, or in the hope that, sympathizing strongly with Sheridan, he would not take it. His state of health has proved the needed obstacle, and Hancock has been sent to Louisiana with power to withdraw or modify Sheridan's orders, Grant's protests—as we write—going for nothing.

We prophesied last week that one of the first effects of Mr. Johnson's recent performances would be the great exaltation of the reputation of the impeachers for wisdom and foresight. Accordingly we find in the last number of *The Watchman and Reflector*, a widely circulated paper, Mr. Johnson's latest follies treated not only as a justification of the attempts made to impeach him last year, but of the dismal forebodings uttered by Wendell Phillips in his lecture called "The South Victorious," two years ago. What Wendell Phillips predicted in that lecture, however, was not that Andrew Johnson would prove a traitor, but that the Northern people would neglect or refuse to reap the fruits of their victory. Now, this particular offence the Northern people have never shown the least tendency to commit. They have from first to last persisted in exacting every guarantee which the demeanor of the Southern whites proved from time to time to be necessary. Mr. Phillips is either constitutionally a pessimist, or he always predicts evil as a matter of policy, and, constituted as the world is at present, anybody who steadily plays Cassandra is sure sometimes to seem to be right. Fortune-tellers are able to make a livelihood by foretelling truly even in one case in a thousand, because their dupes are greatly impressed by the one hit, and forget all about the nine hundred and ninety-nine misses. As a matter of fact, all the croakers about the results of the war have been brought to utter confusion. And as regards Andrew Johnson, Mr. Phillips has been no surer of *his* treason to freedom than he was of Abraham Lincoln's, on whom he lavished an amount of "plain dealing" which both he and his friends must now read with shame and sorrow. At any great crisis like that through which the country is now passing, some prominent person is sure to behave badly; and if one had only to predict this to earn the reputation of a great prophet, we should soon have more prophets than we could well listen to, much less heed. In politics, to prophesy successfully a man must be able not only to discern clearly the general tendency of things, but to foretell the final result. Ten years hence,

there can be but little doubt, Andrew Johnson's career will be looked on as but an episode in the reconstruction process, of far less consequence than General McClellan's share in the conduct of the war.

The World of Tuesday last declares Grant's letter to the President to display "a fervor of remonstrance more in the vein of a sensational writer for a newspaper than of an habitually cool and reserved general of the army." It also calls it "a singular protest;" decries its "parade of earnestness;" and asserts that it must have been written for the public rather than for the President; and much more to the same effect. To enjoy all this thoroughly, the reader ought to hunt up McClellan's famous letter from Harrison's Landing, and then read the comments of *The World* on it *passim*, during the years 1863–64. That letter was written in the midst of defeat by a general who had never won a battle, had no political experience—a young, untried, and almost unknown man; and in it he practically warned the Government against a certain political course. For folly and impudence that epistle had no parallel in history, and yet for two long years it was paraded by the Democratic press, with a shocking want of humor, as an extraordinary display of wisdom. General Grant's letter is the letter of a tried, trusted, and victorious soldier who has saved the country, a member of the President's cabinet, and written in reply to a request for advice from a politician of amazing and admitted stupidity.

The canvas in Ohio is calling out some of the Republican leaders in speeches which will be of real value in all parts of the Union. Senator Sherman delivered last week a really able one at Canton, reviewing the whole controversy between the President and Congress, and Congress and the Democratic party. He threw on the last the whole blame of delaying the work of reconstruction, and warned it that it cannot hope for success in the contest it is now waging, though he acknowledged that it may hereafter do good service as an opposition. He met one of the strong points of the Democratic speakers by showing that Congress, in exempting national bonds from State taxation, had simply adopted and confirmed the doctrine laid down by repeated decisions of the Supreme Court during the last forty years. The whole address was in fact something far better than a stump speech—it was a real lesson in political science, full of good sense, logic, moderation, and fairness. Mr. Wade also held forth at Marietta, but in what may be called the "rousing" vein, bearing about the same relation to Mr. Sherman's that the great Uri cow-horn bears to a violin. He "handled" the Democratic leaders "without gloves," defended negro suffrage by divers good and some bad arguments, and closed with a hearty outburst of honest indignation over the Democratic onslaughts on the national credit.

Ambassadors, as well as the sovereigns or presidents to whom they are accredited, are apt to have their ingenuity severely tested in trying to produce on presentation day points of contact or resemblance between the nations they respectively represent. There has, perhaps, never been a diplomatist who had more unpromising materials to deal with in the performance of this duty than M. Blacque, who was introduced to Mr. Johnson the other day as the emissary of the Sultan. But he got out of the difficulty remarkably well, everything considered. For instance, he drew attention to the fact that Turkey and the United States "are both conquerors, one conquering by the force of arms, the other chiefly by the arts of peace." So, also, it might be said that the Bedouins and the Americans were both commercial people, the one acquiring with the bow and spear and the other acquiring by hard labor. The Spotted Tails have also a strong bond of sympathy with the real Yankees, as they are both travelling nations, fond of moving from place to place in pursuit of gain. The "democratic affinities" of the United States and Turkey, of which M. Blacque made mention, would, we fear, form an indifferent basis for closer union. The fact is that, in spite of the remarkable resemblance between the two which M. Blacque has pointed out, there are no two peoples in the world which differ so widely. The American is nervous, the Turk is phlegmatic; the American is industrious, the Turk is lazy; the American eats fast, the Turk eats slowly; the American wears tight clothes, the Turk loose clothes; the American travels much, the Turk does not travel at all; the American loves the buggy, the Turk loves the saddle; the American in repose puts his feet on a level with his head, the Turk in repose sits on his heels; the Turk loves the pipe, the American the cigar; the American rarely takes his boots off, the Turk rarely puts them on; the American loves female society, the Turk thinks no society so poor; the American thinks all men are as good as he, the Turk thinks himself better than any man; the American can hardly conceive of any government except a government by law, the Turk can hardly conceive of any government except a government by individual will; the American thinks Turks may be saved, the Turk thinks Americans will surely be damned; in short, the two nations stand at the opposite extremes of two totally different civilizations, and we suspect M. Blacque must have had a good laugh when he got home from the White House.

A body called the "National Labor Congress," composed of delegates from various working-men's associations, has been sitting at Chicago during the past week, discussing the relations between labor and capital, and organizing machinery for supporting the claims of labor as against capital. The resolutions adopted will well repay perusal on the part of all who want to get an idea of the condition of the working-men in the matter of economical knowledge. They denounce the eight-hour laws passed lately by four States as frauds and shams; and want to have imperative eight-hour laws passed by both Congress and the State legislatures, a gift of $25,000,000, and legislative help in resisting what they call the encroachments of capital. The form this help is to take is, as well as we can make out, some kind of regulation of the currency; but, after a diligent study of this portion of the resolutions, we confess we are unable to give any clear account of them. It appears from them that "money is the medium of distribution to non-producing capital and producing labor, the rate of interest determining what proportion of the products of labor shall be awarded to capital for its use, and what to labor for its productions," and that Congress has it in its power, and it is its duty, so "to make money and regulate its value" (we are quoting literally) "that it may be a correct and uniform standard of value, and distribute the products of labor equitably between capital and labor, according to the service or labor performed in their production." It is impossible to read the foregoing without pain; happily, the exceedingly small amount of influence exercised by the "Congress"—if we may judge of its influence from its revenue—enables us to read it without anxiety. Some of the popular lecturers ought to devote their attention to the diffusion amongst the working-men of some knowledge of even the rudiments of political economy.

The case reported a few days ago, from South Carolina, of the young colored girl who, for having resisted an assault made on her by a white one, was carried to the woods by a mob of citizens, stripped and whipped nearly to death, "a justice of the peace" presiding at the ceremony, is a striking illustration of what the value of the "civil law," as a protection for life and property, would be if the South were just now left to itself. The "justice" and several of his confederates, we are glad to say, have been tried by court-martial and sentenced to a short term of imprisonment and hard labor. Those who believe, as we do, that the first object of government is the protection of life and property, and who know how little government under this definition there has ever been at the South, will heartily rejoice that the Southern whites should get such excellent lessons as this in the meaning of the word "law," even from courts-martial.

The Protectionist League, which has been established as a counterpoise to the Free-Trade League, has proposed to the latter to publish, jointly, a paper containing arguments and replies in each number from both sides of the controversy, and the Free-Trade League has been foolish enough to refuse. What is wanted above all things in this discussion is to get both sides before the same persons, and before as large a number of persons as possible, for we shall never have a settled financial policy till the public has decided upon it knowingly. At present not one man in a thousand has any ideas about free-trade or protection at all, so there cannot be said to be anything worth the

name of public opinion to appeal to. As matters stand, protectionist publications go to protectionists and free-trade publications to free-traders, and little or no progress is made. We should have been glad to see the joint publication for another reason. It would have helped to break down the habit of reading only party organs and treating as an outrage all expressions of dissent from party views in the newspaper one subscribes to, now so prevalent, and so prejudicial both to right feeling and sound thinking.

Escobedo has, through Don M. Z. Gomez, "Citizen Military Commander of the line of the Bravo," denied formally the authenticity of the letter attributed to him some time ago, calling for the expulsion and slaughter of foreigners, and especially Americans. The letter of General Gomez is a model of "Latin" composition. One of the reasons he gives in support of the denial is, that General Escobedo "knows a republican should have no prejudices, and that in whoever he sees industry, good faith, virtues, civil or social, there he should meet a brother, whatever might be his nationality." After this we hope nobody will speak disrespectfully of General Escobedo.

The news from the Indian war continues to be conflicting and incomprehensible and unsatisfactory. There are tremendous fights every day almost, in which the slaughter of Indians is very heavy, but in which somehow the whites get the worst of it. For instance, Major Wombwell, on the 2d inst., fought three thousand Indians for three hours with twenty-nine men, and killed two thousand Indians with a loss of six men to himself, so that each of his men must have killed about seventy Indians, or an Indian every two minutes and a half. If this sort of fighting continues, the public will have to call on the Government to withdraw the troops from motives of humanity.

Mr. George W. Copeland returns to the vexed question of General Banks's alleged drunkenness on a certain Saturday and Sunday in Portland, last year, and shows in a long letter to the Malden *Messenger* that he is, and always was, ready to produce *in Portland* oral proof of the drunkenness aforesaid, but written affidavits he will not furnish for divers good reasons. There is, however, no likelihood that General Banks or his friends will ever go to Portland to hear any evidence on the subject, and therefore the general is likely to enjoy his seat in Congress during the remainder of his term in spite of his offer to resign in case the offence was proved against him. In fact, so much of his term has now elapsed that his condition in Portland in those memorable days is fast becoming an abstract philosophical question, of little interest to anybody but the student of human nature.

A more revolting and yet amusing illustration of the hold of great names on the popular imagination we do not know of than the attention paid by the press to Mr. Thomas Carlyle's last rhapsody, "Shooting Niagara." There is hardly a newspaper of respectability on either side of the Atlantic which has not "noticed" it with greater or less elaboration, and many have solemnly and in set terms refuted it. And yet, no matter by what standard we judge it, it is pure rigmarole, the nonsense of a foolish and conceited old man, which, if written by a person unknown to fame, no intelligent writer would dream of wading through. The American who has borne "a leading part" in the events which have led to emancipation, and whom he cites as an authority for the assertion that the negroes "are being improved off the face of the earth," is probably a noted feuilletonist, whose share in bringing on the war was about as important as his share in conducting it.

The news from Europe is unimportant. The English Reform Bill is law, but as a clause has been inserted in it, providing that if a dissolution should take place before January, 1869, the election shall be held under the old law, little will be known of the working of the new law for the present, and there will be plenty of time for speculation. The London *Times* comments on the refusal of the Commons to have a formal "conference," in the old style, with the Lords on the amendments—sending a clerk with their reasons instead—as something ominous. The rule has hitherto been for the Lords' Committee of Conference to sit with their hats on and receive the Commons' committee standing and uncovered; but the Commons are evidently not prepared to endure this humiliation any longer. They are masters, and they know it and mean that others shall know it.

The main topic of interest on the Continent is the meeting at Salzburg between the Emperors and Empresses of France and Austria, out of which the newspaper gossips all expect a Franco-Austrian alliance to grow; and the interest of the matter is increased by the alleged assertion, on the part of France, of a right of interference with regard to any German questions still remaining unsettled. As we said last week, all the ordinary motives and indications render an alliance between France and Austria and a counter one between Prussia and Russia probable. Austria can clearly only prolong her life by clinging to some healthy and stronger organism. With affairs in this condition, a capital opportunity would offer itself to Italy to make a good bargain with the Catholic powers about Rome, as her army, in case of a European conflict, could turn the scale; but unhappily her financial condition paralyzes her. If she reduces her armament she loses her political importance, gives up all immediate hope of Rome, and runs the risk of being bullied by France; if she maintains her armament, her bankruptcy becomes a question of months. She has now tried nearly every expedient, and there is still an awful deficit every year. Piling on the taxes does not seem to help matters, as Italians evade taxation by economy in a way which, to any northern people, would be impossible. Americans or Englishmen would revolt sooner than scrimp themselves as Italians are now doing There is still talk of a Garibaldian move on Rome, and there has been a sharp correspondence going on between the Italian and French Governments touching a speech of General Dumont (French) to the Papal Zouaves, in which he assured the French amongst them that they were still in the French service. Garibaldi is, however, old and has lost much of his prestige, and Dumont has been disavowed. So the chances of a Roman revolution are still small for the present.

Chief-Justice Crozier, of Kansas, delivering judgment lately in the case of Searle agt. Adams, 3 Banks 515-518, remarked with great force and clearness, speaking of the Statute of Limitations:

"For some years past, upon the disposition of each succeeding case involving a construction of this statute, it was considered, by bench and bar, that fiction itself could scarcely conceive of a new question to arise thereunder; but as term after term rolls around there are presented new questions, comparing favorably in point of numbers with Falstaff's men in buckram: thus adding to the legions that have gone before a new demonstration of the propriety and verity of the adage that truth 'is stranger than fiction.' With the heat of ninety-eight degrees of Fahrenheit in the shade, and the newspapers teeming with reports of the ravages of our common enemy, who, the more effectually to accomplish his double purpose of capturing the imprudent and frightening the timid, has assumed the form of the Asiatic monster, it might be supposed by the unthinking that the consideration of such questions would be entered upon rather reluctantly. But we beg to disabuse the public mind of any such heresy. Cases might be imagined where 'smashes' would not stimulate, nor 'cobblers' quicken, nor 'juleps' invigorate; but a new question under our Statute of Limitations, in coolness and restoring power, so far exceeds any and all of these, that when one is presented, the 'fine ould Irish gintleman's' resurrection under the circumstances detailed in song becomes as palpable a reality as the 'Topeka Constitution' or the 'Territorial Capital at Mineola.' The powers of a galvanic battery upon the vital energies are wholly incomparable to it. So that the consideration of this case, upon this day of wilted collars and oily butter, should not entitle the Court to many eulogies for extraordinary energy in the fulfilment of its duties."

The same learned judge has held that a jury is not bound to disbelieve a prostitute on her oath, because

"It ought not to be said that a woman pours out from her heart at Venus's shrine with her virtue every other good quality with which, in our thoughts, we endow her sex, whether she habitually flaunts her frailty in the face of the world, or attempts to hide it in retiracy, or garnish it with garlands of good works."

Although there is much in the foregoing deliverances with which all good lawyers will concur, we think it right to add that neither Judge Underwood nor Judge Busteed has, to our knowledge, passed on either of the points under discussion, in any reported case, and the bar will do well to suspend its judgment.

Notes.

LITERARY.

One branch of our periodical literature is prolific enough—we mean the monthly magazines. A man must now choose from among *Harper's, The Atlantic, Hours at Home, The Galaxy, The Northern Monthly, London Society, The Broadway, Cassell's Magazine, The Eclectic*, the various denominational monthlies, and the three or four diluted magazines for "ladies" and the family, which abound in weak fiction, weaker versifying, fashion plates, patterns, and domestic recipes. It will be observed that only three of the above-named are independent of illustrations. Whether they or their pictorial rivals are to be reinforced by *Putnam's Magazine*, which is now announced, we cannot say. Of course among all these vessels of amusing information there are some of brass and some of clay, and in ten years or less from now the latter will have gone to the bottom with cracked sides, to be succeeded by other pottery equally sanguine and equally brittle. The chief reason, we apprehend, why the new magazines make such little head against the old is, that the literary talent of the country is limited enough to be preoccupied by one or two. Money, fortunately, cannot accomplish everything, and if it could succeed in seducing say the contributors to *The Atlantic*, it would in all probability neither purchase their best productions nor the favor of the public. But it would not be enough to pay more liberally than Messrs. Ticknor & Fields; there must be also a certain social position—and, we are glad to believe, character with which the mere money-making spirit is incompatible—on the part of their competitors without which no alliance could be formed, much less preserved in the case supposed. To doubt the quality of new ventures, however, is not to deny them all chances of success. There are grades of readers for every grade of writers, and some are numerous enough to support what satisfies their taste.——Messrs. E. B. Myers & Chandler have in press "El Bib, or God and Man in the Light of Nature," by Edward R. Roe, M.D.——Messrs. Nichols & Noyes, Boston, publish shortly "Ecce Cœlum, or Parish Astronomy," in six lectures, by a Connecticut pastor, which looks through nature to the God of nature; "Striving and Winning," a book for girls, by Mrs. Pike; "Our Birds," by E. A. Samuels, designed for young readers, and treating of the more common birds, their habits, etc., with numerous illustrations; also a large-paper subscription edition of the same author's "Ornithology and Oölogy of New England."——Messrs. Hurd & Houghton have in press "Four Years in Spanish America," by F. Hausserek; Sidney's "Arcadia;" and "Society and Scenery in Turkey and Greece," by S. G. W. Benjamin—a book which ought to be entertaining.——Mr. James Miller has now nearly ready a new edition of Mrs. Browning's works, in three volumes, patterned as nearly as may be after the Farringford edition of Tennyson.——Messrs. Charles Scribner & Co. publish in September Timothy Titcomb's new poem, "Kathrina: Her Life and Mine;" J. K. Paulding's "Bulls and Jonathans," uniform with Paulding's "Literary Life;" "The Art of Composition" and "The Art of Discourse" (a text-book on rhetoric), by Prof. H. N. Day, of Yale College. In October: "Prayers—Pulpit, Occasional, and Social," by Rev. Henry Ward Beecher; "Language and the Study of Language," by Prof. W. D. Whitney, of Yale College; "The Queens of American Society," with twelve or thirteen fine steel engravings, by Mrs. E. F. Ellet; Froude's "Short Studies on Great Subjects;" "The Old Roman World, Grandeur and Failure of its Civilization," by John Lord, LL.D.; J. K. Paulding's "Tales of the Good Woman." In November: "Extemporary Preaching," by F. B. Zincke; and two volumes of Lange (Genesis–Corinthians). In December: J. K. Paulding's "Dutchman's Fireside," and one volume of Lange (Thessalonians, Timothy, Titus, and Hebrews).——Mr. Henry M. Wynkoop has in press the truly "Handy Volume Edition of Shakespeare," in thirteen volumes 16mo, closely imitating the original of Messrs. Bradbury & Evans, London. The reprint is to be sold only by subscription, and the Bradstreet Press will ensure it most excellent typography.

—Mr. Dawson's *Historical Magazine* enters, with the July number, upon its second volume (new series). We have been most edified by the article contributed by Mr. Geo. H. Moore on "Woman's Rights in Massachusetts" and the version of a Chinese history of the United States. Mr. Moore is never quite happy except in harrying the Puritans, and when, by ingenious argumentation, he has proved that South Carolina outranks Massachusetts in abolishing slavery, he is ready to amuse himself, as here, by proving the Puritan State to have been the earliest champion of woman's rights—at least to deserve "the honor of the first recorded attempt to vindicate woman's right to vote." Seu-Ki-Yu is not so voluminous as Bancroft or Hildreth, and his history occupies only two pages of the magazine. He is not very clear in his narrative of military operations during the Revolution, but in a single masterly sentence he resumes the tedious protraction of the war: "Sometimes victorious and sometimes vanquished, Washington's determination and energy never failed, while the English general began to grow old." The historian even concedes that "in devising plans, he [Washington] was more daring than Chin Shing or Hain Kwang. In winning a country he was braver than Tson Tsan or Sin Pi." In his book-reviews Mr. Dawson seizes at least one opportunity of insinuating his doctrine of State-Rights, more than one of reprobating the war for the Union, and as many as he can of betraying his partisanship while rebuking others for preferring the interests of party to the Truth of History. These idiosyncrasies detract materially from the otherwise valuable character of the magazine.

—Persons who have pen-handles, rulers, chairs, and especially canes made of the Boston Elm, the Hancock House, the Charter Oak, the frigate *Constitution*, and who are concerned for the authenticity of this sort of property, will be glad to learn that the Queen's wood-carver, Mr. W. Perry, has come to the rescue of the original Herne's Oak in Windsor Park, which fell to pieces August 31, 1863, and gave Mr. Perry a good deal of business in his line. To maintain the genuineness of his wares, Mr. Perry diligently instituted enquiries and collected proofs, some of which are forcible, and which, taken altogether, sufficed to convince him that the tree in dispute was the real one. This conclusion sets at ease, among others, Miss Burdett Coutts, who encased copies of the first folio edition of Shakespeare's plays, and of the first collected edition of his poems, in a casket fashioned by Mr. Perry from the wood of the fallen oak. A drawing of this casket, engravings of the two rival oaks, Shakespeare's crest, certain antiquated initial letters and type ornaments, and old-style text, are employed to color the argument for longevity advanced by the author.

—Mr. Ross Browne's experience of Icelandic hospitality is quite matched in discomfort, but surpassed in amount, by that of C. W. Shepherd, M.A., F.Z.S., as told in his "Northwest Peninsula of Iceland" (Longmans). He went to that land of fire and water to "settle some vexed questions in ornithology," and this obliged him to reach the island nearly three months before it is habitable by the ordinary traveller. Mr. Shepherd accomplished nothing for science, owing to the unfavorable weather, but this only rendered his indoor adventures more piquant.——The subject of mediæval taxation in England is well illustrated in the reprint "Gesta Regis Henrici IIdi Benedicti Abbatis," edited by William Stubbs, M.A., Regius Professor of History at Oxford (Longmans). The original of this work, says *The Chronicle*, is scarce, and to the present edition Prof. Stubbs has added a preface and other introductory matter, including the Itinerary of Henry II., modelled on Mr. Hardy's of King John. Omitting mention of the sources of revenue, the amount was, under the Confessor, £40,000; under William the Conqueror, £55,000; 31st Henry I., £66,593; in the last of Henry II., £48,781; Henry III., £40,000 normal, raised by extraordinary measures to £50,000. To obtain the modern equivalents for these sums, the Conqueror's revenue may be multiplied by 20, and that of Henry III. by 15. Of course there was an increase of population between these extremes.

—The following books have been recently imported by Scribner, Welford & Co.: "The Institutes of the Roman Law," by Frederick Tomkins, M.A., D.C.L. (Butterworths). Part I. alone is as yet issued, and gives an account of the sources of Roman law, from the earliest period to the decline of the Western Empire. The second part, when published, will contain "a dogmatic explanation of the law." The work is an elementary one for students, and sheds needed light on the jurisprudence of Germany particularly, and on that of England not a little.——The keeper of the Greek and Roman antiquities in the British Museum, Mr. C. T. Newton, M.A., publishes through Messrs. Day & Son his "Travels and Discoveries in the Levant." This delightful and, for the antiquary, inexhaustible region has already furnished material for a great many fine books. Mr. Newton's first volume is chiefly occupied with what he saw at Mitylene and at Rhodes, but has glimpses also of Malta, Athens, Constantinople, Salonica, the Troad, Scio, Cos, and Tenedos. The illustrations are mainly from photographs and are quite vivid. The second volume is an abridgment of the author's larger work on "Historical Discoveries at Halicarnassus, Cnidus, and Branchidæ" (London, 1862). But it has eleven new photographs, from drawings by Mr. Newton, of remains of sculpture, etc.——One of those works which, having been dispersed in various countries, make us regard Macaulay's New-Zealander with complacency, knowing that he can never taunt us from London Bridge with at least one "lost art" of the ruined empire, is the "History of the Machine-wrought Hosiery and Lace Manu-

factures," by William Felkin, F.L.S., F.S.S. (Longmans). It is a bulky volume of 560 pages, and is not only a history, but a manual of these manufactures as now conducted, having illustrations and minute descriptions of all the processes and machinery.

—A novel called "Melchior Gorles," by Mr. Henry Aitchenbie, has lately been published in London, and has been received with commendation by some of the leading London papers. It certainly contains some remarkable passages. The following, for instance, is a striking description of the sort of feeling awakened in the breast of an average Englishman by a fine work of art. The hero is at Florence, and sees at the Uffizi Albertinelli's famous picture of "The Salutation." He says:

"As we stood for the twentieth time gazing at that '*Salutazione*,' I felt, and I frightened the dear old mother out of her wits as I confessed to her that I felt, that *I should just like to roll myself before it and howl.* I have been conscious of *the same profound* feeling in the presence of other astounding works of art, but of that above all others."

After this delicate criticism, Mr. Aitchenbie says:

"Oh! what would I give to get *some of those idiots* of the Pre-Raphaelite persuasion before that wondrous picture, *to hold them by the scruff of their necks and shake them till their eyes shoot out,*" etc. etc., and "*I should like to rub their noses against it,*" etc. etc.

We fancy that some of our own artists have felt much in this way toward the art-critic of *The Tribune,* whom they suppose to be of what is called the *Pre-Raphaelite persuasion,* but they have hardly expressed themselves with such forcible elegance.

—Since the Crimean war Englishmen have, much to their advantage, acquired from their neighbors across the Channel many ways and habits of life which the orthodox John Bull of the good old times would have denounced as decidedly un-English. Moustaches and whiskers, for instance, were formerly regarded by them with unfriendly eyes, and it was not till the *entente cordiale* brought the English in closer contact with the French that society got accustomed to huge beards, and that French elegance and ease improved somewhat the stiff English manners. But the advantages of the alliance were mutual. The French mounseer got a full return for what he gave. He got *enchanté* with *rosbif,* pale ale, the latest English fashions, which are now indispensable accessories in the life of the Paris *gentleman,* and last, not least, with the Anglo-Saxon "sport." At first, however, Monsieur had very vague notions of riding and of sport, as may still be seen daily in the Bois de Boulogne; but, by frequent visits to Tattersall's, Newmarket, and the Derby, and still more frequent shavings by English horse-dealers, grooms, and jockeys, he acquired not only a *vernis* of sport, but became by-and-by a real sportsman. When, in 1865, Count Lagrange's "Gladiateur," with H. Grimshaw as jockey, won the Derby, the triumph of the Frenchmen was great. The battle of Waterloo had been avenged by "Gladiateur" on the plains of Epsom. This victory was celebrated by the count, in connection with the Jockey Club, by a great dinner and ball given to the principal English sportsmen. Since 1862, two French sporting papers have been published, one named *Le Derby,* the other *La Gazette des Courses. Le Derby* is the acknowledged organ of the Paris Jockey Club, and is edited by E. Porte, Dumas fils, Ponson du Terrail, A. Karr, etc. It gives all news regarding sport, and a selected feuilleton. In the sporting articles all English sporting-words are to be met with, the French having adopted them in their language. The "event" of the French turf is the "Courses de Paris" on the first and second of June, where this year M. de Montgomery's "Fervacques" won the "grand prix de Paris" of 100,000 francs. The greatest international race-courses are those of Baden-Baden, where every summer, on the last of August and on the first three days of September, the *élite* of the European turf congregate, and let their horses run for prizes set by the Grand Duke of Baden, by the town of Baden, and by Mr. Benazet, proprietor of the gambling-house. The prizes are insignificant compared with the enormous bets.

—A souvenir of the Paris Exhibition is the "Album de l'Exposition illustrée, Histoire pittoresque de l'Exposition universelle de 1867" (Paris: Gabriel Richard). It has been published from the beginning of the Exposition in bi-weekly numbers, of which forty-eight have thus far been issued, and contains feuilletons on the events of the week with regard to the Exhibition, of the principal parts of which it gives illustrations and descriptions, caricatures, etc. The inevitable Alexandre Dumas is the chief editor of the literary part, to which A. de Gasperini, Charles Maquet, F. Desnoyers, and other names of note among the younger Parisian feuilletonists are contributors. The illustrations are lithographic, printed in the text, neatly executed, and the whole work gives a very amusing and entertaining chronology of the Exhibition and of life in Paris at that memorable period—the golden age of Parisian shopkeepers, *cochers, concierges,* and of "*ces petites dames.*"

—The first part of a "Dictionnaire des Mathématiques Appliquées, par H. Sonnet, Professeur à l'École centrale des Arts," has just been published by Hachette, in Paris (New York: L. W. Schmidt). This denomination of applied mathematics does not, however, include astronomy and physics, which, though using mostly mathematics, form separate sciences, but refers only to the questions of calculus which have relation to commerce, banks, civil and military engineering, industry, and architecture. As far as required, applied mechanics have also been introduced. Most of the articles do not suppose a more than general knowledge on the part of the reader; they give clear definitions, and are chiefly illustrated. The work is well printed, and will embrace ten parts, to be completed by the end of this year.—— A compendium of the "History of Philosophy" has been edited by Dr. F. Schmid aus Schwarzenberg, from the speculative monotheistical point of view (Grundniss der Geschichte der Philosophie von Thales bis Schopenhauer. Erlangen. 1867. New York: L. W. Schmidt). The author undertakes to present in short and impartially written paragraphs the essence of all the prominent philosophical systems, with biographical sketches of their authors, and distributes them among the following groups: the Greek mind, the Roman mind, the Semitic mind, the scholastic mind, French philosophers, English philosophers, the philosophy of the Germans. Two-thirds of the book are devoted to the first division. The book gives a very complete, condensed, and unbiassed history of philosophy. In the last chapter Dr. Schmid, of course, advocates his own view: Schelling's theory of atoms with a supreme spirit.

—A member of the Saxon field-hospital commission has published a report of his experiences during the Bohemian war, with a comparative review of other field-hospital organizations, entitled "Under the Red Cross" ("Unter dem rothen Kreuz. Fremde und eigene Erfahrungen auf böhmischer Erde und den Schlachtfeldern der Neuzeit. Von Dr. Julius Naundorff." Leipzig. 1867. New York: L. W. Schmidt). From statistics in the introduction it appears that the ten wars waged by France, from 1801 to 1815, cost, on both sides, 5,120,000 lives, of which the Spanish war, from 1807 to 1813, alone took 200,000 annually, or, together, 2,400,000. The Crimean war cost 600,000 lives on both sides; the storming of Sebastopol alone, on the 8th of September, leaving 28,000 killed and wounded. At the battle of Solferino there were killed, in the Franco-Italian army, 8 generals, 936 officers, and 17,300 sergeants and soldiers; in the Austrian army, 4 colonels, 630 officers, 19,300 sergeants and soldiers. The losses of Austria during the late war are calculated at 71,267 men, of which 9,671 were killed, 24,096 wounded, and 37,500 missing—of this sum 62,797 belonging to the northern and 8,470 to the southern army. During the Crimean war the French army had 20,000 killed by wounds, while 70,000 deaths ensued from disease. The preponderance in modern warfare of fire-arms over all others is shown by the fact that 98 per cent. of the wounds are caused by shots. The author then passes a very severe criticism on the field sanitary service of the European states, of which he says that, while all other branches of military science have advanced, this one has remained almost everywhere at the stage of fifty years ago—a stage in which the Prusso-Austrian war found it also. The total number of the sick and wounded in the Prussian hospitals, after the day of Königgrätz, was 22,000 men; the number of Prussian killed is not mentioned by Herr Naundorff, but amounts to about 10,000. Most of the wounded were, according to him, left for twenty-four hours, and even three days, on the field, exposed to the heat of a July sun, without water, for the Bohemian peasants had destroyed all the wells for miles around. Moreover, though guards had been placed on the field, it swarmed after dark with peasants and marauders, veritable hyenas, who robbed the dead and wounded soldiers, often murdering or disfiguring those wounded who cried for help or offered any resistance. A Prussian officer testifies that he was lying wounded on the field, was robbed while asleep, and on awakening was at once blinded with a sabre by an old shrew, "so that he might not know her again." The personal staff of the Prussian and Austrian field hospital, though excellent in quality, was wholly insufficient in number, and lacked the most necessary materials. Without the aid of the "Johanniterorden"—a volunteer field-service corps for fetching the wounded from the field during and after the battle, which is under the active management of Count Stolberg-Wernigerode, and has a red cross on a white field as its badge—the number of the not mortally wounded, who died simply from want of water and care on the field, would have been still larger than the one thousand calculated by Herr Naundorff. There were many associations for supplying lint, refreshments, etc., to the hospitals, but they

came too late for the greatest battle of the seven weeks' war. The aid of charitable sisters in the hospitals was very warmly acknowledged by the Prussian commanders, who saw too late that there were neither surgeons, attendants, nor hospital materials enough for that immense number of patients. The details which the author adduces as proofs of his censure are of an unusually shocking character. Six days after Königgrätz, hundreds of wounded who had been carried into churches, stables, and barns, transformed into temporary hospitals, had been left with one surgeon only, who had no instruments, no bandages even, the dead mixed with the living, without provisions, without water. Still worse was it on the Austrian side. The author devotes a large part of his work to the sanitary field service of this country, the management of which during the civil war he highly praises and recommends for adoption in the Prussian, Austrian, and French armies, where reforms are mostly needed.

THE QUEEN'S BOOK.*

THERE has been nothing so singular connected with the singular book which Queen Victoria has thought proper to publish, as the manner in which it has been received by the press both in England and here. We have read with attention all the notices of it which have appeared in the leading newspapers and reviews, and we do not remember to have seen in any of them the least hint that the communication of it to the world was a political mistake, and a very serious one. The preface informs us that the Queen took the advice of a good many friends before deciding on its publication, but we fear they were friends of the class to which the editor—General Charles Grey—and General Phipps belong, men whose lives have been passed in royal ante-rooms, to whom the sovereign's will has assumed the character of a moral law, and who know as little of the way in which the popular mind works as they know of the courses of the stars.

The causes of the "success" of the book, from the publisher's point of view, lie on the surface. Court life, particularly in England, is so carefully concealed from the public gaze, the station of those who figure in it is so conspicuous, or, as *The Court Journal* says, "exalted," that there is, of course, always the keenest desire on the part of the public to know how they eat and drink and pass their time, what kind of clothes they wear, and what they say to each other; therefore, all books which tell what happens in palaces, even in times long gone by, if the work be only decently done, are sure of a sale. When one appears which is written by a queen, and the main feature in which is the story of her own courtship and marriage, of course the desire to read it becomes a rage.

It seems to be taken for granted by many people that the effect of this last revelation will be to establish the Queen more firmly than ever in the affections of her subjects, and therefore to make the monarchy more secure—a result just now doubly desirable owing to the course into which the Prince of Wales seems to be drifting. But the public knew already that the Queen was a pure and affectionate woman, that her domestic life was everything that domestic life should be; what they did not know was the exact mode in which Prince Albert displayed his affection for her and she hers for him, and the exact nature of the process by which they became "engaged." All this the Queen has now told them, and, by so doing, we hold that she has perhaps strengthened the popular esteem for her personally while weakening the hold of her dynasty on the crown. To people like the Greys and the Phippses, royalty is a real force in itself, something with a substance of its own, an "estate of the realm," existing because it exists, and needing no outward support. But then all thinking men know perfectly well that a constitutional monarchy only maintains itself by working on the popular imagination. A despot holds real power. He can put a hundred legions in motion to crush an individual or conquer a state, and therefore will always, till human nature has undergone a total change, be respected and obeyed. But a constitutional king reigns under the law; it is only by the aid of legal fictions that he seems to rule at all. It is not as a "ruler" that the educated classes in England look up to the Queen; it is as the "leader of society," "the first lady in the land," as it is the fashion to call her—a person of great "influence," and capable of changing the fashions. In short, the worship she receives is the same kind of worship the Duchess of Sutherland receives, differing only in degree. With the middle and lower classes it is different. To them the Queen is a real ruler, who watches closely what goes on in Parliament, has fixed views on politics, and who dismisses or appoints ministers as she is vexed or pleased with them, and is a person of extraordinary knowledge and wisdom. We have heard a countryman pointing out to a friend the canopy over the throne in the House of Lords as the place on which her Majesty perched herself during the debates, in order to see what the peers "were up to." Mr. Bagehot, in his recent admirable work on the English constitution, puts this view of the monarch's relations with the main body of the nation in a very clear light, points out the extent to which the throne in England rests at this moment on the popular delusion as to the nature of court life and the character of court personages, and the popular reverence for royal glitter and display, and the danger which the institution runs from the growing spirit of realism, bred and spread by communities such as those of the United States and Australia, in which political business is conducted entirely through the understanding, and in which any attempt to conduct it through the imagination would be met by laughter and derision. This popular delusion once destroyed, it would be plain to all the world that the government of Great Britain was really carried on by the House of Commons, with an executive called a cabinet appointed by itself and composed of its own members, and that the Queen was really a splendid supernumerary, whose sole mission was to impose on the vulgar.

Now, the tendency of the Queen's book is to destroy this delusion utterly. She appears in it herself as a tender and affectionate woman, such as may be found by the hundred thousand in England, but with no capacity or taste for or understanding of politics whatever, with a woman's personal preference for Whigs above Tories, owing to her personal feeling towards the Tory leaders, and with her whole soul absorbed in her conjugal and maternal duties. She lays bare in it her private journal, in which she declares her main object in life at the outset of her career to be to make "this blessed being [her husband] happy," and she seems to have lived up to her resolve. Everything in her conduct afterwards was regulated with a view to his comfort, and, though he was too sensible and conscientious a man to abuse his privileges, every line of the history of her married life reveals the fact that the influence of the royal family on government was *nil*, and that their social influence, outside the ordinary works of charity, was exercised almost entirely through a display of extraordinary conjugal felicity. But in this they did no more than is done by hundreds of families amongst the aristocracy. Fifty years ago it was considered a positive merit in a monarch to lead a virtuous life, and his people felt grateful to him for it, but we imagine that time has passed. The spirit of rationalism, which has been carrying so much havoc during the last century into the domains of tradition and sentiment, has not spared royalty, and kings must now produce more solid titles to the esteem and the money of hard-working millions than simple abstinence from coarse vices.

We hold, therefore, that the publication of the book before us is a grave mistake; that those who advised it must be totally ignorant of the condition of feeling and opinion amongst the English lower classes, and of the tendencies of the times in all Anglo-Saxon communities. It represents the Queen, too, in anything but a majestic light. It strips off from her all her most valuable disguises and paraphernalia, and exhibits her to the world in the commonplace character of a "gushing" and sentimental girl, and then of a "devoted wife and mother." No trace of mind appears in it, and inasmuch as no trace of anything worth the name of "duties" appears in it, the question occurs at every page to the thinking reader, What return does the royal family make for the reverence with which it is surrounded, for its million sterling a year?

We comment upon it thus freely because it is in reality a political phenomenon. It is a formal exposition on the part of the leading constitutional monarch in Europe of her titles to her throne. If it were simply the story of the private life of an amiable and excellent lady, criticism would be unnecessary, for it would carry its own condemnation on its face. The leading English papers have been evidently restrained by social considerations, which have in England extraordinary power, from speaking their full mind about it. We have, therefore, all the less hesitation in speaking out ours, and we do so, while regretting sincerely that we should even seem to undervalue the domestic graces and virtues of which the Queen has always afforded so brilliant and, we are willing to admit, so useful an example. But the time has come when no political institution can look to these things for permanence and security, when something more is exacted of those who ask a nation to lift them above the common cares and common vicissitudes of life and use all its resources in making their homes brilliant and happy and tranquil. Whether the era of reason on which we are entering will be a better era than the era of sentiment which we are quitting, God only knows; but it is certain that "privileged classes" will find no place in it. All will hereafter have to buffet with the waves, and the peaceful and secluded coves will only be gained by the strong swimmers, if even by them.

* "The Early Years of H. R. H. the Prince Consort. Compiled, under the direction of H. M. the Queen, by Lieut.-Gen. the Hon. C. Grey." New York: Harper & Bros. 1867. 12mo, pp. xxiii., 371.

BISHOP PERCY'S FOLIO MANUSCRIPT.*

Of the many subscription printing-clubs which have been set on foot in England during the last twenty-five or thirty years, only the Shakespeare Society, the Percy Society, and the Early English Text Society have offered any great attraction to the mass of the literary world. The two first of these died some years ago, both, we presume, of excessive antiquarianism, though the Shakespeare Society was much less guilty in that way than the Percy. The scheme of both was too indefinite. No subscriber could know what he would get in the course of time, or how long he would have to be a member to complete his set—which is well known to be a great point with your regular book-buyer. From both we had some good things: from the Shakespeare, the Chester and Coventry Mysteries, and not a few desirable old plays; from the Percy, a new text of the Canterbury Tales, some reprints of Garlands, and two poor volumes of ballads, but with these a large amount of miscellaneous trash which it makes one yawn to think of. Conducted with a little more good sense, including a stricter plan and a dash of financial shrewdness, these clubs might have lived longer and have gained a lasting good name. Thus, had the Shakespeare Society proposed to print all the English Drama anterior to Shakespeare, and the Percy all the Romances of Chivalry and the National Ballads, properly so called, their scheme, if executed with moderate prudence, could hardly have failed of sufficient support. The Early English Text Society, let us hope, will not repeat their mistakes. It has already in three years done quite as much for English poetry as the Percy Society accomplished in twelve.

If there was one thing which a society bearing the name of Percy might have expected to undertake before any other, it was to give to the world in full that famous manuscript from which the "Reliques of Ancient English Poetry" was largely compiled. That manuscript was known to contain, besides some romances and tales, more than thirty of the best and most ancient of the English ballads; in fact, about one-fifth of all that now remains of a precious species of literature in which Great Britain, with (or without) the single exception of Denmark, holds a pre-eminence. Among these ballads are Sir Aldingar, Little Musgrave, the Heir of Lin, Robin of Portingale, the Boy and the Mantle, the Marriage of Gawain, Glasgerion, Guy of Gisborn, Child Waters, Child Maurice, Sir Cauline, and King Estmere, and some of the best of these are found nowhere out of the Percy Manuscript. It was also known that nearly all of these noble ballads had been more or less retouched and repaired by the editor to suit the "improved state of literature" in his time. These considerations should have made the publication of the manuscript an object of the first importance with a society devoted to ancient ballads and popular poetry. Yet we have not heard that the council of the Percy Club ever proposed this to themselves, and certainly they never proposed it to their constituents. It is true that the business was not so simple as it might seem. The society could not have got hold of the manuscript by asking for it once, twice, or thrice. That dirty, scrubby, ill-written, mutilated old book has been guarded by the heirs of the bishop as jealously as if it contained all the secrets of alchemy. For a good many years they have refused to allow a line or a word of it to be copied, and they have been brought to terms at last only by pertinacious "worriting" and the administration of a sop of £150. But it is likely that the means which have proved successful now would have been efficacious twenty years ago.

It is to the Early English Text Society, or more accurately to Mr. Furnivall, one of the committee of management, that the victory over the exclusiveness and avarice of the proprietors of the manuscript is chiefly due, and it must be regarded as a most auspicious sign of what may be expected in the future from this vigorous society that, while distributing with unequalled liberality the treasures of public libraries, it should have the spirit to step aside from its regular course to rescue from the chances of destruction and the niggardliness of its owners this invaluable and strictly unique collection of poetry, and to place it within the reach and under the guardianship of thousands. But it must be understood that this much-desired book, though edited and issued by members of the English Text Society, does not form a part of the society's ordinary publications. The sole reason for this is the cost of the copyright, which would have eaten largely into the subscriptions, and so have reduced the amount of the yearly issues, perhaps to the permanent damage of the society, which, to succeed, must give, as it has done, very large returns for the annual guinea. For this reason the Percy Manuscript was made a special publication, and, to meet the extra expense, in addition to copies in the society's usual demi-octavo form, large-paper copies, some of extreme magnificence, are to be issued at the price of ten, five, and two guineas, according to the style. The ten-guinea copies are to be in quarto and the five-guinea copies in extra royal octavo, both on Whatman's best ribbed paper, made expressly for the book, and only fifty of each will be printed, so that book-fanciers will have the attraction of rareness added to that of beauty and, while indulging their innocent passion, will facilitate the society's praiseworthy endeavors to make books of prime importance accessible to readers of very moderate means. The ordinary edition, which is the only one we have seen or want, is furnished to members of the society for a guinea, and we fancy that the American who is accustomed to pay two or three dollars for a barely decent octavo will be well content when he sees the four fair volumes which his guinea has brought him.

A few words will suffice for the description of the Percy Manuscript. It is a folio of 521 pages, imperfect by reason of the loss of the first and last pages and of one half of fifty-four pages at the beginning. It contains nearly two hundred pieces of all sorts, mostly ballads and romances, with fortunately only the smallest admixture of moral and didactic dulness, but one or two bits in all, if we have rightly observed. A number of pieces are interspersed which are the opposite of moral and didactic, not the harmless *coprolites* of a remote age, but rank and noxious specimens of comparatively modern dirt, such as would suit the age of Charles II., in whose time the collection seems to have been made. These, for good reasons, are to be put in an appendix by themselves, making the last of four volumes, all of which are to be out before September.

The texts of the first volume have been edited by Mr. Furnivall, who has reproduced them with all but superstitious care, and has had the proofs and revises read three times with the original. Each piece is prefaced by an excellent introduction, all, except one or two, by Mr. Hales, and a general introduction, glossary, and indexes are to follow. We do not know when an important literary task has been undertaken with more spirit or executed with more fidelity.

The preface to the Reliques had prepared us to find the contents of the manuscript in a bad condition, and we must say that our expectations have been exceeded. Those who do not set much value on the wild flowers of poetry will probably wonder at the enthusiasm with which a book of shreds and patches, as they may call it, is heralded. The man that regards torsos and legs and arms as rubbish, and prefers the Bavarian Walhalla to the Vatican Museum because none of its lymphatic heroes have suffered a smash or a smooch, will think our careful editors fools for their pains, and wish that the scullion who lit his fires with one-half of the first fifty pages had disposed of the rest of the manuscript in the same useful way. Another, who keenly appreciates ballads, will be thankful that so much has been preserved, and will speak more civilly of the stupid copyist, and even of the vandal scullion, than of Percy with his improved and restored texts. When he sees the fragment of the Child of Elle, thirty-nine lines in all, out of which the two hundred lines of Percy's ballad are made, or compares the original with the emended and completed Sir Cauline, he will think scorn of polish and elegance, and declare the bishop a greater botch than the scribe. But while we avow that we are behind no one in our disesteem of Percy's editorial labors (that is, his furbishing and restoring, for the taste shown in the choice of pieces was excellent), and while we are perfectly alive to the fact that a supercivilized man of the eighteenth or nineteenth century can no more think, or *un*think, himself into the mental condition of a ballad-maker than he can put off his flesh and sit in his bones, nothing shall induce us to speak with disrespect of Bishop Percy. Any one can see from his prefaces that he loved a ballad—not wisely, but well. He was no prig and no pedant, and through all his apologies it is plainly perceptible that in his heart he much preferred the "artless productions of the old rhapsodists" to the compositions of some "who had all the advantages of learning." We also incline to think that he knew the people of his time, and that that "polished age" would not have tolerated the uncouth ballads of the manuscript had they not been first trimmed and doctored by the bishop.

Before closing, we desire to commend the Early English Text Society, as we have taken occasion to do before, to the patronage of Americans, and at the same time to hint to the society how desirable it will be to proceed with system—to complete, for instance, first, the Arthur literature according to the original plan, and then to give the other English romances. There are many good things in the list prepared for publication, but nothing which more deserves welcome than the announced edition of Piers Plowman, our best poet before Shakespeare, excepting Chaucer, and *not* excepting Spenser. And why should not the society do something, and do a great deal, for Chaucer, of whom we have still but one text, and who is, critically speaking, unreadable, and will be, until his language has been thoroughly studied in several *printed* versions?

* "Bishop Percy's Folio Manuscript. Ballads and Romances. Edited by John W. Hales, M.A., Fellow and late Assistant Tutor of Christ's College, Cambridge, and Frederick J. Furnivall, M.A., of Trinity Hall, Cambridge, etc." Vol. I. London: N. Trübner & Co. 1867.

THE MAGAZINES FOR SEPTEMBER.

MR. SUMNER contributes to *The Atlantic Monthly* an interesting sketch of some of the principal persons who have prophesied the coming greatness of America, including Sir Thomas Browne, Bishop Berkeley, Turgot, John Adams, Galiani, Adam Smith, Governor Pownall, David Hartley, Count Aranda, Burns, Fox, and Canning. The prophecies are all remarkable examples of political foresight; but singularly enough, as we have observed elsewhere, there is not one which anticipates from the rise of the new world any marked improvement in the condition of the race. What they foretell is simply a transfer of power from the Eastern to the Western hemisphere. Mr. Sumner points out in a very sensible moral that the destiny of the United States is to be accomplished through peace, and not through war. Mr. T. W. Higginson finds in the scenery of the shore at Newport something suggestive of Petrarch's sonnets, and furnishes graceful translations of eleven of them, under the influence of Newport yachts, or sloops, or sunshine, or atmosphere, or flowers, or birds. The reflections by which they are strung together are, however, hardly worthy of the translations; most of them have a laborious air. Mr. C. D. Shanly, who has apparently become a regular contributor to *The Atlantic*, writes pleasantly on "Canadian Woods and Waters"—the article being, however, rather an account of life and manners in the Canadian backwoods than of the forests and streams and lakes themselves. He tells some curious stories of the semi-genteel society, composed of retired English officers and broken down scions of good houses, which some years ago was to be found in Upper Canada, often bravely endeavoring to keep up in the heart of the wilderness the usages of fashionable life. In "The Nightingale in the Study" Mr. Lowell declines the invitation of the songsters of the groves, in order to keep company in his study with a still sweeter singer—Calderon,

——"his nightingale—
His Arab soul in Spanish feathers."

Miss Clarke concludes her "Hospital Memories." The stories she tells are of a kind now familiar to every one, which seem to lose none of their terrible pathos no matter how often they are told, and they cannot be told too often. It is doubtful if in any war the forms of suffering were so varied as in the late war, and it is certain that in no war did sorrow and bereavement fall on a community rendered so sensitive by education. The rebels had the satisfaction of knowing that no bullets ever carried desolation into so highly civilized a society as theirs did, and none, therefore, inflicted such multiform torture. Miss Clarke closes her narrative with a touching mention of the fact that, of the six who composed the "happy sisterhood" of mercy to which she belonged, she only survives; the others perished in the midst of their labors.

Of all travellers whose acquaintance we have yet made, always excepting Serjeant Kinglake, Mr. Howells is, as we have more than once remarked, by far the pleasantest companion. He is almost the only traveller we know of who can tell of his travels without occasionally becoming a bore, who knows when to moralize and how much moralizing is good for us, and whose humor, without ever being anything coarser or more material than a delicate aroma, diffuses itself through the whole frame like a powerful essence. He is continuing in *The Atlantic* the pleasant sketches of Italian travel which he commenced over a year ago in THE NATION, and beginning with Pisa, runs through Como, Trieste, and Bassano. The Italians owe him a debt of gratitude for being the first writer who gives foreigners a distinct impression that Italy would be a pleasant place to live in or travel in, even if there were no pictures or fine architecture in it.

"The Mystery of Nature" is a poem by Mr. Theodore Tilton, in which he celebrates what the schoolmen used to call the "essence" of things, or what the Kantians call "things in themselves," the something or other, whatever it be, of which all that we see or feel is but the outer crust. Nevertheless, when we call the composition a poem, we confess we do so through sheer laziness. It is *not* a poem. It is rather a rhyming ontological essay. In justification of our embarrassment about its name, we may quote the following:

"The stars are lighted in the skies
Not merely for their shining;
But, like the looks of loving eyes,
Have meanings worth divining.

"The waves that moan along the shore,
The winds that sigh in blowing,
Are sent to teach a mystic lore,
Which men are wise in knowing," etc., etc.

"A Wife by Wager" reads like a translation of a rather poor French story, and is clearly padding. F. M. Finch sings, in some very fair verses, the graceful impartiality of the women of Columbus, Mississippi, in strewing flowers on the graves of both the National and Confederate dead. In "Fugitives from Labor" (anonymous, but we suspect Mr. Howells) there is some good and very amusing speculation on the cause and tendency of the prevailing indisposition to work, as displayed in the distaste of young men for the manual arts, and their rush into commerce, and some pleasant discussion of the more favorite modes of earning a "genteel" livelihood. The article would have been better if it had been longer and gone deeper, for the subject is an important as well as amusing one. It contains some good remarks on the prevailing picture mania; to call it a "taste for art," as the newspapers usually do, is an abuse of language.

There is a veteran joke, which has served in the forlorn hope of a great many witty passages, to the effect that one of Napoleon's colonels, on the eve of an election, announced universal suffrage to his men in some such terms as these: "The suffrage is free; but any man who votes against the First Consul will be shot at the head of his regiment." The author of the article on "Rome or Reason," in *The Catholic World*, appears disposed to make a serious use of this aged pleasantry, and embodies precisely the same idea in summing up some very startling arguments in proof of the character for toleration and progress which the Papal Church has borne in all ages. He dwells upon the good Mother's fondness for the natural sciences, and writing probably with Galileo and the other philosophers whose discoveries we owe to her nurture in his mind, declares:

"She teaches the ideal or general principles of all the sciences, and teaches them infallibly, and thus gives the law to all scientific investigation, which *savans*, in their inductions and deductions, are not at liberty to transgress. Our philosophers and *savans* are perfectly free to explore nature in all possible directions, but they are not free to invent hypotheses and theories not reconcilable with the universal principles she teaches, or to oppose their conjectures to the principles she asserts, because all such conjectures or theories are unscientific and false. The ethnologist is free to investigate the characteristics of the different races and families of men, but not free to deny the unity of the human race itself, or the descent of all men from one and the same primitive pair, who must have been immediately created and instructed by God himself."

We cannot dissent from this writer's conclusion that he "has left much for the reader to do for himself by his own thought and study;" but it does not seem to us so certain that he has "said enough to vindicate Rome from the charges preferred against her." To be quite frank, we think he has himself made out one of the worst cases we know against the Church, and has admitted, in a very compact and apposite form, all the deplorable accusations of her enemies. Unhappily there is nothing else in this number of *The World* to relieve the reader of the discouraging impression left by the leading article.——"Protestant Attacks upon the Bible" is by the same ingenious writer, as we imagine from a similar parade of toleration and a common "come, let us reason together" tone. We suppose that as the writer only twice calls his opponent a liar, he ought to be considered a very temperate theologian.——"The Two Lovers of Flavia Domitilla" continue to be troubled in their passion, and their historian in his rhetoric. We read of taxgatherers in the reign of Domitian, who must have been as uncomfortable as our own revenue inspectors, since "they ground the people with iron heel until they bruised out the last cent from their pockets." It is doubtless to Celtic fervor we owe the statement that the emperor was heard "grinding his teeth like small wheels in machinery, and muttering broken curses with livid lips."——The range of *The World's* poetry is from poor to poorest.

In *Hours at Home* Dr. Bushnell continues his thoughtful papers on the "Moral Uses of Dark Things," and there are several articles of interest and value. It is a good number of a magazine that grows better. Mr. Tuckerman talks pleasantly of "Studs," and Miss Mary A. Shearman sketches well "A Visit to Andersonville." "Pilgrimage and Cholera," by James O. Noyes, is a graphic account of those religious journeys to Mecca to which we owe at least the last visitation of the cholera.

There is so great a charm in the mere rehearsal of the autumnal aspects of nature that the reader of Mr. Walt Whitman's "Carol of Harvest for 1867" (in *The Galaxy*) has at first an impression of poetry somewhere; but this illusion fades as the catalogue advances, and we get among the mowing machines and agricultural steam-powers. The performance is like all other performances of Mr. Whitman's: ejaculatory, extremely vocative, incoherent; it expresses no ideas, and suggests mere emotion; it is in no sense a worthy celebration of the first great peace-harvest after our years of war. We suppose this sort of thing will have to go on for awhile, and we shall try to bear it patiently.——Mr. Alger contributes a very interesting and pleasing sketch of the famous friendship of Lady Eleanor Butler and Miss Sarah Ponsonby, who forsook the gay world in the last century, and went and lived together for fifty years in conspicuous and more or less literary retirement in the Vale of Llangollen, Wales. It was a romantic and harmless experiment, and its success ought to abash those who doubt female con-

stancy in friendship.——Jean Ingelow's new volume is lavishly praised by Mrs. Prescott Spofford, who finds that, though Miss Ingelow "possesses no such drowning surge of splendor, such weltering wealth of words as Mr. Swinburne has," still she is not to be classed "with Miss Rossetti and a host of minor singers," for "she rises as much above them as some wave that shoots its shaft of spray into the sunlight rises above the level ocean."——The "Reminiscences of Dr. Anthon" come from enthusiasm and affection, and are entertaining enough. We would rather not have known, however, that the departed scholar once caned two boys who were late at school on account of a railway accident; that he had a habit of telling culprits "long beforehand that at a certain hour they were to be caned," thus "ensuring the pleasures of anticipation;" and that he would sometimes "keep a boy in a suspense amounting to torture by having him up in his room where he was teaching his own class, holding him there for an hour or more in expectancy, and turning from his class every now and then to frown upon the poor wretch, shake his finger ominously at him, or point significantly to the well-known drawer in which the canes were kept." Doubtless, this savagery was not characteristic of a learned and excellent man, whom we hate to see in the light of a cruel pedagogue.

Two encounters with brigands, a speech in English to the Florentine populace by the Senator, and the Senator's flirtation with an Italian countess, give a spirited variety to the records of "The Dodge Club" in *Harper's Magazine*. It is not a hard kind of reading, nor, we think, a hard kind of writing; and some of the illustrations are very amusing.——We cannot say so much in praise of "The Haunted House at Watertown," except that, as we happen to know, it is based upon facts well known in that neighborhood. We are displeased with the way in which that lovely, guilty governess, with "the queenly form, dark dreamy eyes, and a wealth of wavy brown hair that was a wonder to look at," is thrown away here on a few pages of ghost story—put to walking up and down stairs, and brought to early expiation of her sins—instead of being hoarded up in a three-volume romance, and kept bewitching, unblushing, and reprobate to the last. When we consider how different a destiny either she or the colonel's beautiful, bad niece would have met in one of Mr. Collins's novels, we can scarcely repress a lament. Is a "wealth of brown wavy hair" so common that it is to be tossed aside, as it were, in this manner? It might have been combed for hours; it might have been let down the back; it might have been shorn off in a fever! But there is a like waste of material in all parts of this story; and it astonishes us the more because the paper is evidently from some old magazine hand which we should have thought would be slower to unclose from so rich a prize as "The Haunted House in Watertown."——Having once already voyaged with the canoe "Rob Roy" we do not embark with a feeling of great novelty upon its cruise in the Baltic.——In "The Yankee before the Throne" the confidant of royalty speaks freely and amusingly enough of the Americans who seek favors at the hands of Louis Napoleon and his ministers, accompanying them with inventions, projects, and presents. The writer tells of a most sumptuous copy of a famous unabridged dictionary which he found kicking about in the room of Mocquard the Secretary. Mocquard implored him to take away this treasured gift of the publishers, saying that such things "pestered" them, and very naturally asking, "What does the Emperor of France care for Woochestaire Sauce's Dictionary?"——"My Mexican Mines" is the story of a Californian's investment in that kind of property, and is one of the best papers in the magazine.——"The Easy Chair" is pleasant and wise, as it always is, and is notably just upon Maximilian and the misconduct of the students at the Worcester regatta.

We have the first number of *The Broadway*, which is an international magazine in the sense of having English contributors and American readers. We shall not judge the first number harshly, though candor will compel us to say that it does not sustain the ideas of liveliness raised by the enormous gayety of its prospectus. We are given the opening chapters of the romance by the author of "Guy Livingstone," entitled "The Fortunes of a Free Lance," and sooth to say, gentles, it seemeth a parlous tale which might well bring terror to stout hearts and tears to beauteous eyes. There be "grinded teeth" and "grinded spears" in the history; and is it a light thing, lords, that Simon Dynevor is taken captive in the third chapter, and "set in saddle in a clump of spears?"—or that old Sir Giles, a few pages on, falls under his horse's feet in such plight that "the least learned in leechcraft, who stood by, guessed that their lord had been stricken down by swift and deadly palsy?" Of a truth, nay! It betokeneth such "wealth" of invention in the romancer that we may be sure the reader will fail sooner than he upon any given occasion.——At this distance from the London theatres we cannot take a lively interest in the qualities of the "Dramatic Critics" whom Mr. Hollingshead "criticises;" but we hope we have a proper sense of the value of Mr. W. Clarke Russell's paper on "William Cullen Bryant and American Poetry." "The Americans," says Mr. Russell, with that fine air of discovery and explication which we all know so well, "have as yet, properly speaking, no literature of their own," and goes on to say that though Mr. Bryant has regrettably written like an Englishman, he is nevertheless the first of American poets. It is a flimsy little paper, but perhaps American poetry does not merit a great deal of thought, or perhaps Mr. Russell has not a great deal of thought to give it.——"In the Season" is illustrated, and is interesting as showing what a dull man may learn to do by persistent application. Mr. Edmund Yates is all that reading of light, satirical works of genius can make him, and we must own that in this paper they do not make him otherwise than insipid. His sparkle is the foam of small beer.——We do not think of anything to say of "English Stabilities," by the Rev. C. W. Denison, late United States Consul for British Guiana, or of "Second Thoughts," by F. C. Burnand, or of any of the three copies of verses in *The Broadway*. Of the magazine, as a whole, we have to say that we do not see how it can at all interest American readers.

Notes on the Origin, Nature, Prevention, and Cure of Asiatic Cholera. By John C. Peters, M.D. Second Edition, with an Appendix. (New York: D. Van Nostrand. 1867.)—This very interesting and instructive little book has reached a second edition within a very short period of its original publication. Dr. Peters has certainly produced the best minor treatise on cholera which we ever read. It is not exhaustive and does not pretend to be, but it is eminently practical, and can lead no one astray from the correct principles of theory and practice.

Dr. Peters gives us a pretty full list of the so-called remedies for cholera. No mention, however, is made of chalk, which some physicians have used largely with apparent success.

From a very large experience in the treatment of cholera we are convinced that medicines exert no effect whatever in arresting the disease when it is fully developed. All our power consists in preventing the occurrence of the premonitory diarrhœa, and in cutting short this first stage. It is not our province to enter with Dr. Peters into the discussion of the several points—etiology, pathology, and therapeutics—introduced into his book. In regard to some of them, our opinions coincide with his; as relates to others, our views are diametrically opposite. This last fact does not, however, prevent our recognizing the excellent qualities of his treatise.

A Treatise on Emotional Disorders of the Sympathetic System of Nerves. By William Murray, M.D. (New York: A. Simpson & Co. 1867.)—Whilst this can by no means be regarded as an exhaustive treatise, it is eminently suggestive, and is devoted to a class of diseases which have been too much neglected by systematic writers. Any sensible person reading Dr. Murray's book will undoubtedly obtain many useful ideas and no small amount of valuable and striking information. At the same time there is nothing very new in it to well-read physicians. The regulation of the emotions is one of the most important duties of mankind. To control them, to bring them into subjection to the higher faculties of the mind, inevitably conduces to happiness and intellectual power. Dr. Murray's treatise contains good advice on these points, and the treatment urged for the diseases which result from emotional disturbance is topical and in accordance with sound pathology.

History of the United States of America. For the use of schools. By Charles A. Goodrich. Revised and brought down to the present time by William H. Seavey. (Boston: Brewer & Tileston. 1867.)—This seems to be an excellent little manual of our history for the use of schools. It is written throughout in a loyal though unpartisan spirit, and the story of the country's life as told here is well calculated to develop feelings of patriotism in children. The arrangement of periods and paragraphs is good. The use of two sizes of type calls attention to the leading points in the history, and impresses them more deeply on the mind. The Declaration of Independence and the Constitution of the United States are given in the appendix, together with a table of the chief officers of the Government from the beginning. It is, on the whole, the best school history of the United States that has fallen under our notice.

Good Stories. (Boston: Ticknor & Fields.)—First of a series intended especially for travellers, and well adapted to their eyes and hands; fair and open typography, and shape a convenient 16mo. Four of the story-tellers in this volume are like good wine that needs no bush, and these are De Quincey, Hawthorne, Tom Hood, and Theodore Winthrop. The remaining two are less familiar names. Each story is illustrated and by a different artist. The publishers mean to make all languages contribute to this collection, of course through the medium of translations.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

THE USE OF MR. JOHNSON'S FOLLY.

It is not worth while to make a minute comparison between the struggle now going on at Washington and that of King Charles I. and his Parliament. It would not be worth while, even if the two cases resembled each other in detail more closely than they do; for these elaborate historical parallels only serve to distract the attention from the great points at issue, and amuse more than they instruct. In the real nature of the struggle, however, there is a remarkable resemblance, and one from which we may, if we choose, derive lessons of the greatest value. Fortunately for us—still more fortunately for our chief magistrate—they differ very widely in some respects. Charles I. would hardly have lost his head or James II. his crown if there had been a fixed point of time when his term of power, would expire by its own limitation.

It is a most fortunate thing for the country that this struggle for power between the executive and the legislature has been connected with and complicated by a violent dissension upon the political issues immediately before us. So superficially do most people think upon the fundamental principles of politics, so great are the attractions of a strong government such as the war gave us, and so ready are we in general to let things take care of themselves, that probably nothing less intense than a political quarrel could have brought our community either to see in what direction we were drifting, or to desire to withstand the current. As it was, the dispute upon the immediate practical issues went on for months, all the time growing hotter and fiercer, before it began to be generally seen that something more vital even than reconstruction was at stake, and that the President had been exercising a dangerous degree of power, which only his own bad faith and bad temper had at last overthrown.

The question over which we have been contending all these months is one which is worth the delay, expense, and bad blood which it has occasioned. For it lies at the very foundation of any political system to determine what is the ruling power in the last resort. When our Constitution was established, Montesquieu's theory of the co-ordination of the three departments of government was accepted as a fundamental principle, and incorporated in the new organic law. It was a great step in that day thus to vindicate the independence of the judiciary and the legislature, and by this free the fountains of law and justice from the absolute control of the monarch. But no theory could prevent the three departments from trying their strength against one another, or decide that in that case the weakest should not go to the wall. If the Supreme Court should give a decision adverse to the moral sense of the nation, not even the memory of Jay and Marshall could help it from being overridden by the popular will. And if the President should choose to measure his strength with Congress, it would very soon appear that, of the three departments, the legislature possesses the power, and that, possessing the power, it will be master first or last.

The real value of the doctrine of the equality of the departments is two-fold. The first is historical, that it freed, as we have said above, the legislature and the judiciary from the control of the executive, in which in past ages they had always been. In the next place, it lays down a rule in accordance with which the powers of government may be best organized. If the functions of the three departments are skilfully and clearly defined, there will be no temptation in ordinary times to overstep the prescribed bounds, and one could hardly decide offhand that the power which condemns a man to jail or that which pardons him out is not the strongest power in the state. To a superficial view, the legislature appears the weakest of the three; its power is latent, but *it is there*, ready to be called into actual exercise; and he is either a very brave or a very foolish man who ventures, in the light of historical experience, to provoke it.

The ignominious overthrow of the President by Congress is not, therefore, a political revolution, but the effect of a rapid development of the natural tendencies of the Constitution. It is precisely the change which is going on in England, only that here a weak, shallow, and obstinate President has caused it to be much more violent and rapid than it has been there. Let another George III. or IV. come upon the throne, and we shall be very likely to see the power of Parliament exalted even more triumphantly than that of Congress has been. Even if it were a revolution, however, we should not for that reason deprecate it. A constitution which does not accommodate itself to the changing needs of those who live under it, had better perish; and if the opinions and necessities of the public have undergone a revolution, the constitution should do the same. If it is a revolution, we are peculiarly fortunate—all the more so on the heels of a tremendous war—to have it accomplished peaceably.

But the truth is that this victory of Congress does not work a revolution, but prevent one. All through the war the Democratic newspapers were telling us that we were suffering the President to establish a centralized absolutism. They were right: and that would have been a real revolution, not merely destroying the balance of power in the departments of government, but placing them again upon the basis that existed before their independence was acknowledged in theory. That danger is past, and now the same newspapers are making the same outcry at the usurpations of Congress. Are they right now, as they were then? If the peril is a real one, the factiousness of their criticism should not blind us to its truth.

In the first place, the power which Congress is now, as we admit, exercising in an extraordinary degree, is, as we have shown, a real and essential power of a legislature in a free state. The possession of power is certainly no excuse for using it badly; nor does *power* necessarily imply *right;* that Congress can override the executive does not prove that it can do so legally. But legislation is the undoubted right of Congress; and we claim that prescribing the terms and conditions of reconstruction is a purely legislative act, and therefore belongs properly to Congress. If, in doing this, or in the struggle which has grown out of it, Congress has pushed its legitimate authority to an unreasonable extent, or has stretched its power beyond the limits of right, the responsibility rests chiefly with him who began to play at usurpation.

After all, even admitting that Congress has encroached upon the functions of the executive, legislative usurpation is not, like executive, susceptible of systematic and continuous exercise. A legislative body may, at seasons of great excitement, and under the influence of strong passion, act for a short time with energy and despatch; but it can only be for a short time. The natural disposition of a large body is to slowness and indecision, and this will surely prevent a continuance of such encroachments for any long time. When the times demand, a legislature will show that it possesses the chief power in the state; but when the exigence has passed, it will very readily let the reins slip out of its hand again. And our American executive is endowed with such extraordinary authority and such enormous patronage that we need never fear but that it will succeed in the long run in maintaining all the powers which properly belong to it. Our strongest protection against executive usurpation is to recognize distinctly that Congress is the strongest power in the state, and therefore, in the last resort, the first power.

We have opposed with such arguments, and with as much earnestness as we had at command the attempts made during the past year to impeach the President. We did so from the belief, which we still retain, that up to this summer he had done nothing to justify a resort to so dangerous a precedent. But we have no hesitation in saying that should he attempt, as he seems now likely to do, to prolong the conflict between himself and Congress; should he persist in claiming for himself the right either to legislate or to judge what laws are constitutional or expedient, and by that judgment regulate his official conduct; should he, in short, either by the kind of men he selects for cabinet ministers or for military commands, or by the instructions he

gives them, show unmistakably that he aimed at nullifying a law of Congress, or executing it in a manner different from that in which the legislature intended it to be executed, it will be the bounden duty of the legislature to remove him, even if he has not proved himself guilty of any technical violations of duty. He might stay within the letter of the law and yet pardon Jefferson Davis and Breckinridge and put them both in his cabinet, and put Robert E. Lee in the War Department, but the country would not tolerate it, come what might. If he now obstinately perseveres in refusing to acknowledge his subordination to Congress, every consideration of safety and duty calls for his removal. The spirit he is displaying is the legitimate result of the extraordinary extension given to the power of the executive during the war. It must be crushed at once, and crushed so sternly and effectually that no future President will ever allow it to take possession of him.

GOOD GOVERNMENT.

In a recently published letter, Mr. Herschel V. Johnson has stated, with much earnestness and evident sincerity, his objection to the acceptance by the South of the Congressional scheme of reconstruction. He disclaims all hostility to the negro race, and while manifesting his belief that they can never be raised to the same degree of civilization and intelligence as the whites, expresses his desire to invest them with all the privileges which, in his opinion, they can safely exercise. But the extension of political franchises to them will be, in his judgment, "fatal to good government," their ignorance and incapacity being such as to disqualify them for the safe exercise of such privileges. He appeals to the Northern people to punish the South, if they are resolved to punish it, in some other way than by imposing bad government upon it. For, as he concludes, "there can be no prosperity for any people cursed with *bad government*. Capital, energy, and enterprise will shun it."

What Mr. Johnson says about bad government is certainly true, and deserves the consideration of all Americans in these days of almost universal political corruption. No community can thrive under a system of government radically bad. Justice, fearlessly and intelligently administered, is the vital element of national prosperity. Under no other administration can industry be certain of its reward, and commerce be free to bring that reward to its door. Bad government casts doubt and discouragement over every man under its influence; makes the bad worse, and tempts the good into evil courses. And a system of government which tends throughout a long course of years to produce maladministration is one of the greatest curses that can befall any country. New York city has fallen under such a system; and the extent to which its inhabitants have been plundered of their property, poisoned in their health, and corrupted in their moral ideas during the past few years, should warn other people of the dangers arising out of corrupt government.

We admit, too, that there is a presumption in favor of Mr. Johnson's assertion, that the admission of several hundred thousand ignorant and half-civilized men to full political privileges, will tend to produce bad government. Such privileges, doubtless, afford in themselves a species of education; but they have not sufficed to elevate the Mexicans or the South Americans to the rank of civilized nations, or to secure to them decent governments. It is natural to presume that men who have received little moral and no intellectual training, will use their ballots unwisely; and Mr. Johnson, having become satisfied that the negroes will use their votes against his friends, is, of course, confirmed immovably in this presumption.

But, after all, this is only a presumption; and the circumstances which make it conclusive to the mind of Mr. Johnson have little weight in ours. No man would be fit to vote who, except for the sake of some high moral purpose demanding such a sacrifice, would vote to deprive himself and all his posterity of any voice in their own government. Some Germans and Englishmen, in their zeal for the liberty of the slave, did consent twelve or thirteen years ago to vote for men who sought to disfranchise foreigners, but that disfranchisement would not have affected their children, and was indeed so visionary a scheme that most clear-headed men felt it to be unworthy of a moment's anxiety. But Mr. Johnson would make it a test of the negro's fitness to vote, that he should support candidates who have until now been able to exclude him from voting at all, and who infallibly would, if they again had the power, exclude him and his descendants to the remotest generations from all political franchises, no matter how wise, how learned, how virtuous, or how wealthy they might be. Nay, more; the negro, to prove his fitness to vote, must vote for men who have until now denied and would forever deny him the privileges of education, who would exclude him from giving evidence in the courts, and who do not believe in his manhood. And for what reason is the negro thus to vote? For the sake of a great principle? From considerations of patriotism, philanthropy, or religion? Not at all. Simply because a candidate of this kind was his "old massa," and while holding him in slavery for twenty to fifty years, was so kind as not to flog him a great deal, and to give him his peck of corn weekly.

The path of duty may seem very clearly to the Southern whites to lie in this direction, but our appreciation of the negro's capacity to vote increases exactly in proportion as he pursues the opposite course, and refuses to be directed from the support of measures tending to elevate his race by considerations of mere good neighborhood or personal friendship. And this leads us to the final question, Whether the admission of the negro to political rights, ignorant and degraded as he unquestionably is, will or will not lead to bad government in the South?

If Mr. Johnson's other assertions were true, and the South had really had, for the last fifty years, or even for the last two, a good system of government, faithfully administered, and sustained by a healthy public sentiment—if "even-handed justice" had been "meted out to white and black"—there would be some good ground for agreeing with him in deprecating the sudden introduction of a new and ignorant class of voters. But, unfortunately for Mr. Johnson's argument, the Northern people believe, and we *know*, his statements on these points to be erroneous. "Good people" have *not* been welcomed at the South. Even-handed justice has *not* been meted out. The theory and practice of its governments have been fundamentally wrong. The object of government is the protection of the weak against the strong. But Southern government has made it its chief object to confirm the power of the strong over the weak. We know, moreover, that a vast proportion of the white people of the South are just as ignorant as the blacks, and a great deal more shiftless and lazy. The problem presented to us is not the propriety of inundating an intelligent, educated, and patriotic community with a host of ignorant and unpatriotic voters—though that is an evil to which we submit at the North for the sake of ultimate good. In the South, we *must* accept the votes of vast masses of illiterate and degraded men. The only choice that remains is to admit or exclude other masses, equally illiterate, but far more anxious to learn, and infinitely more patriotic, according to our understanding of the nature of patriotism. We see in the latter course the remedy provided by a wise Providence for the ills of the state: a counterbalancing weight which equalizes the forces of ignorance and will make both sides glad to have the services of wise men; and we make our choice without hesitation, fully believing that only in this way can the educated and religious class of the community hold the balance of power, and that in this way, and in no other, can the South attain the blessings of good government.

What evils does Mr. Johnson anticipate from this choice? Confiscation is a bugbear. It has ceased to be such in the hands of Mr. Stevens; but it has become the stock-in-trade of his bitterest opponents. What other wrong can be expected from the negro? Unequal legislation? The idea is absurd. The laws will be equal, and they will be mainly administered by white men. Education will certainly be made universal. Opportunity will be given to all men to do what they honestly can. There never was an ignorant race more in love with learning, more anxious for the elevation of the whole people, than the colored men of the South. Their admission to the elective franchise has already done wonders for the South, and we are confident that in a very few years the action of Congress will be so thoroughly vindicated by the event that every politician will be as anxiously proclaiming his lifelong faith in universal suffrage as he is now his inborn opposition to slavery.

A LOST ART.

Mr. Charles Sumner has an interesting article in the last number of *The Atlantic Monthly*, in which he has collected the prophetic allusions made by various authors, ancient and modern, to the discovery of this continent, and the growth upon it of a great empire. As a literary curiosity the collection is sufficiently striking; but then the prophecies, as prophecies, are not as remarkable as they seem. The belief that there was somewhere in the great Western ocean a new continent, was very widely diffused both in the ancient and mediæval world. It was a belief which analogy naturally suggested even to the uneducated mind, and of course it found its way into contemporaneous literature, and the wonder really is not that we meet with so many traces of it, but with so few. The continent, too, having once been discovered, colonies once established upon it, and an adequate idea having been obtained of its extent, climate, soil, and productions, it did not require any great powers of prevision to foretell the growth on it of a great political community. Given the conditions which favor the growth of population, and you may always safely foretell the rise of a body politic; for against absolute and confirmed anarchy or barbarism any community of European origin has always been sure. What was difficult to foretell, and what the prophets, therefore, have not attempted to foretell, was the kind of polity which would prevail on the new continent, and it is not a little remarkable that not one of them has ventured to hint, even, that America would be, in a peculiar degree, the home of freedom and equality. All they knew was that it would be a powerful nation—and this, as we have said, it needed no very great perspicacity to discover.

The fact is that the material growth of the United States has been extraordinary, but it has been natural and logical. It has been in every way what was *à priori* to be looked for. Given a new country of boundless extent, temperate climate, and fertile soil, and you are sure of a rapid increase in population; but that, the population being of Anglo-Saxon origin, you are almost sure of equality and political liberty and a rapid increase of wealth, was a deduction which the men of the seventeenth and eighteenth centuries were not prepared to make, for the data for it did not exist. Here a prophet would have had a good chance to show his skill, but none appeared. In wondering over the growth of the United States, too, or of any other country of the Western world, we must avoid being carried away by the mere material magnificence of it. There is no great merit in doubling the population once in twenty-five years when the supplies of food are endless. There is no great merit in making 7,000 miles of railroad when every mile of it opens ten square miles of virgin and inexhaustible soil. No number of hogs or bushels of corn can exalt a nation greatly. Its mission is moral and intellectual, and its material growth is only a subject for rejoicing in so far as it aids in the attainment of moral and intellectual ends—and, it must be admitted, the moral and intellectual results produced by modern society thus far are not remarkable either in number or value, though they are far more numerous and valuable in the United States than anywhere else.

Modern society has been preaching the Christian religion for eighteen hundred years, and yet only a very small fraction of the population of the globe has been reached by it, and of this small fraction only an infinitesimally small proportion really and sincerely believes in it. In the education of children the progress made, too, has been lamentably small; in fact, the teacher of our day, considering the material facilities placed at his disposal, has made very slight advances on his mediæval predecessor. The condition of women and the mode of regulating the relations of the sexes is almost as tough a problem, and is looked at with despair by almost as many minds now as in the declining days of Rome. The one political contrivance possessed by the modern world of which the ancient world knew nothing—and we admit that it is an invaluable contrivance—is the representative system; but it is safe to say we have made no advance on the ancient mode of governing cities. We have devised no means of staving off the great curse of ancient society—the inequality in the distribution of property; and the tendency towards it in most countries is now nearly as strong as it has ever been. Nor have we succeeded in reproducing in any modern community the intense public spirit, the deep sense of association, by which ancient communities were animated, although the law of self-sacrifice—of indifference to self, and constant regard for others—is the basis of our religious faith. In fact, it is only within a few years that the spirit of co-operation, in the highest sense of the word, has begun to show itself strongly in politics at all. In the sentiment of art, and in the influence of art on our lives and character, we cannot compare ourselves either to the ancients or mediævals. In humanity, however, in the sense of the value and dignity of man, we have reached a position immeasurably higher than any age which has gone before us, and this it is, no doubt, which is eventually to lend our civilization its great distinctiveness; but only comparatively very little of the work has yet been done. So we may as well be frank and confess that, in spite of our wonderful material advantages and achievements, advantages and achievements such as the ancient world never dreamed of, we have really only in a very trifling degree advanced the ends for which human society exists. We have founded immense empires; we have equipped great fleets and armies; we have brilliant courts and splendid temples; but all these things were familiar enough to the ancients. We beget children rapidly and send out great colonies, but, considering the greater ease with which we live and travel, no more rapidly than they did. There is in this not much to boast of. We have republics of longer duration than theirs, but none which have as yet done more for humanity and progress, or endowed the race with a better stock of ennobling memories or ideas.

There is one story in ancient history which moderns should never weary of pondering, and which the more they ponder the more wonderful, more puzzling, more instructive, and more inspiring it seems. It is a story, too, from which every modern nation ought to learn a lesson of modesty and of courage, and over which the great chroniclers of hogs and corn, of exports and imports, of looms and reels, may well hold their breath. When we say it is the story of the Roman Empire, probably nine out of ten of our readers will lay down their paper with scorn, and declare with a sneer that it is an old story and that they have learned from it all they are ever going to learn. But nine readers out of ten never think of the Romans as anything but conquerors, and fancy that when they foot up the number of square miles and of people subject to the sway of the Queen of England or the Emperor of Russia or the United States, they have produced a match for it. Of the Romans as organizers and instructors and civilizers only very few readers ever think; and yet, when we reflect on what they achieved in this character, their military exploits fade into insignificance, and so does nearly every effort made by any modern nation to spread civilization beyond its own borders. Here was a little city, taking its rise in an age of universal darkness, with no light and no models from the outside, and which, in the length of time which has elapsed since the conquest of England by the Normans, conquered Italy, Spain, France, Britain, and a large portion of Germany—all of them then barbarous countries—and not only brought them up to its own level of civilization, but supplanted their very language and put its own in its place, and devised for their use a system of jurisprudence so wise, so logical, so enlightened, so pervaded by a knowledge of human nature, that it has survived the changes of 2,000 years, and still in every one of them, except England, binds society together in bonds that bid fair to last as long as civilization. It must be remembered, too, that this was done without printing, without railroads, without telegraphs, and, in the main, without Christianity; done by dint of toil and endeavor and moral force. None of the achievements of any modern nation can for a moment be compared with it; and modern nations are still so far from being able to rival it that the moral power of Rome is a secret over which scholars continue to argue, but of which no satisfactory solution has yet been offered.

HINTS FOR CONSTITUTION-MAKERS.

BY A JUDGE.

III.—The Judiciary.

The old New York Court of Errors appears to have been, *theoretically*, the worst court ever constituted. Thirty-two gentlemen, doctors, bankers, mechanics, merchants, farmers, and (worst of all) second-rate lawyers—holding office only four years, one-fourth going out of office every year—one day a senate, the next a court, its members

coming from eight senatorial districts, all politicians and all chosen not as judges but as legislators—what could be more absurd? And yet I must confess that this "multitudinous court," as Chief-Justice Bronson has somewhere called it, made better decisions *of law* than any court that this State has ever had. I have followed nearly if not all the overruled cases up, and, with every prejudice in favor of the old Supreme Court and against the Court of Errors, I have been forced to agree that, *in the result*, the Court of Errors was almost always right. And what is still more strange is that, when there was what is called a "hard case" there, this multitudinous court generally maintained the rigid rule of law, even when the court below, consisting of a few eminent lawyers, might have strained the rule to cover some unusual equity.

The Court of Appeals came with its eight judges, chosen as judges, and at first all eminent lawyers—a comparatively small, compact, and durable court that should never be divided, and yet it has weakened itself by divisions more than the Court of Errors ever did, and the *results* of its decisions have been questioned oftener. When a jury disagrees on some paltry question of fact, affecting no one but the parties in court, the judge sends them back with an injunction to hear each other's reasons, to re-examine the conflicting evidence, to eliminate the truth, and to agree. When school children come up with different answers on their slates, no teacher assumes that all parties may be right. There is not much more reason why judges should differ on a question of pure law than mathematicians on a question of pure mathematics. There may be a difference as to the facts in a case, but as to the law there should be no difference, and, like the school children, the division shows that somebody has added up wrong.

If there is a doubt of this it must be dispelled by a glance at the English courts. How little division is *there*. For thirty years the King's Bench, under Mansfield, was not once divided. And now, as a case travels up through the Queen's Bench, the Exchequer Chamber, the House of Lords, how each superfluous question seems to drop off, until at last the one or two great problems which the case presents receive an undivided solution and become for ever fixed and known. That there is something wrong in our appellate system no one can deny, but *where* that something is, few of us are agreed. I incline to think that the fault is *not* in the Court of Appeals. If the court were increased to nine judges, and those judges were not changing every year, something, doubtless, would be gained in capacity for work and unity of action, but not enough to overcome the monstrous mass of judicial trouble which is accumulating in front of that tribunal. Where, then, does the real evil lie?

Laying aside my own theories and other men's, I see certain facts. I see that the English system is sufficient for all England. I see that our national system would be ample for all America, if the judges of the Supreme Court were relieved from the circuits. How comes it that the comparatively little State of New York, with a permanent appellate court substantially like the Supreme Court of the United States, and with its judges freed from circuit duties, is unable to dispose of its appealed cases? I answer this question by saying that the evil is not *in* the Court of Appeals, but in the courts *below*. Our general terms are shams. There is in effect but one appeal, and that is to the Court of Appeals. Everybody may go there, and everybody *does* go there that can give security. The general terms *retard*, they do not decide, appeals. When a great case is "on its way to the Court of Appeals," it merely passes through the general term. The judges think it useless to spend time upon it, and the counsel think it useful to conceal the real points they intend to make. Instead of the case being stripped of half its doubts on the journey, its doubtful points are multiplied, so that the court of "last resort" has more propositions to examine than the *nisi prius* tribunal whence it began. The only alteration which can reach this evil will be one that will make the intermediate decision a reality. How this shall be done, the Convention must decide; but if it is not done, no alteration in our highest tribunal will effect a reform. It can be done easily, as, for example, by enlarging the general terms to five judges, and allowing appeals to the higher court only where the general term is divided, or the importance of a question certified. Appeals to the general term must be made realities; appeals to the highest appellate court must be diminished; the means are unimportant provided these ends be reached.

There will still remain the want of unity in these eight intermediate tribunals. This cannot be reached absolutely so long as we have eight judicial districts. We cannot abandon that system now, but the Court of Appeals may be used to *unitize* the eight courts below when they decide the same question differently, as it will be used to *unitize* the divided judges of any one court. In other words, if one district does not follow another on the same point, its decision may be made subject to appeal, or both be brought up by *certiorari*. As for the half-dozen courts that "crop out" in the greater cities, let their general terms be expunged, and let those judges sit as *ex officio* members of the Supreme Court constantly at *nisi prius;* let us have unity at least in the same judicial district.

The question of an elective or appointed judiciary is one of the most interesting that will come before the Convention. With all the prejudice of a New-Yorker against the elective system, and after some old efforts to be rid of it, I am constrained to admit that in at least five districts of the eight the elected judges have been just as good as any that an appointing power could select *from those districts*. I think, too, that no governor would have made better selections for the Court of Appeals than the people have done. A few—one or two—objectionable men may have squeezed in, but, nevertheless, they were just the men who would have squeezed in through the appointing door. We have not selected Kents and Spencers. The trouble is, we have not had them to select.

But in the great cities? In the first judicial district, what is the case there? Once I was a member of a judicial convention, and my vote let loose upon the city of New York a most improper and objectionable candidate for a high judicial office. I had acted conscientiously and carefully. I had gone into the convention with two or three good men on my individual "slate." But one had declined, and another had been withdrawn, and the third had been defeated, and then I had been obliged to choose between two candidates who were strangers to me, and I had chosen badly, and my vote carried the nomination. Now if I, who was both lawyer and politician, innocently was instrumental in giving a bad judge to an important court, what must it be with the mass of citizens who are neither lawyers nor politicians? Such a monstrous absurdity as calling these election lotteries "a system" probably cannot be found in any other State. We may as well meet the fact that it is no system—that it is a cheat, a humbug, an illusion, which can lead to nothing good, and must lead to the most dangerous of political evils—a corrupt judiciary!

The remedy which our first thoughts suggest is to go back to the appointing system. But it may be set down as a certain fact that the country will not yield its system, and the country rules in the Convention. What then? Shall we have two systems for different districts, and *elect* a judge of the Supreme Court in one and *appoint* another judge of the same court in the next? There is a savor of "special legislation" about this project which the Convention does not like, and which the people do not approve. Shall we let the abuse go on and acknowledge that it is without remedy? Then our Convention, instead of being the ablest, should be written down as the most imbecile assemblage that ever boasted and bragged, and then disgraced the State. This is the one special evil that must be remedied.

Looking at the belief of the country in one system, of the city in another; at the temper and prejudices of the Convention, it is hard to predict what will be, or to suggest what can be, done. Perhaps a practicable compromise would be to elect the judges of the Supreme Court on a State ticket. They would come from and act for judicial districts as at present; and in political conventions the delegates from each district would, in fact, nominate the candidate for their district. But the selections would look more to prominent lawyers known out of their district, in order that the ticket might gain strength, and the weak places of the present system would be swallowed up and recast in the whole. In the cities, too, there would be a class of watchful voters who would throw their votes for the best ticket, and certainly would try to defeat the questionable characters that have been hopelessly successful there. These votes would help the whole State ticket, and, reacting, would secure in time better nominations in each party. The more it is examined, the less objectionable this change appears, and, though not all that is desired, it contains more than can be procured by any other *probable* means.

But there remains one important point to be determined when the question of appointment is settled. It is undeniable that the General Government pays less and gets more in the way of judiciary than New York. A judge will resign his State office to accept a U. S. office of no greater dignity and of less salary. Why? Because, as we all know, the U. S. judge holds his office for life; because, when he has sacrificed his private business and has learnt to do well the duties of his office, he is not liable to lose the one without regaining the other; because he is not dependent upon political conventions or party caucuses for renominations; because he is independent.

The present constitution of New York was based on the vile idea that the public service was political patronage. It sprang out of the dissensions of a party over their spoils. Its controlling idea is that an office is for the benefit of the holder, and that in such property as many as possible must share. Accordingly, the judiciary hold for short terms, so that a new set of successors may have a part of the private benefit of office. Nay, more, to such a length does it go that it even "divides the spoil" of presiding over judicial tribunals, and regulates the practice so that each judge shall have his little portion. A convenient theory comes in and suggests that the frequency of election produces a rectitude and courtesy in the judge. As a matter of fact, we know that rectitude and courtesy depend on the man. We know also that the most questionable rectitude and the most gross discourtesy is to be found among these short-termed judges. If a comparison be made between them and the various U. S. circuit and district judges who have sat in our first judicial district, then courtesy and dignity will be found to exist with an independent judiciary.

The former constitution of this State limited the judicial tenure to the age of sixty. When we reflect that this provision did deprive the State of the best twenty years of the lives of Kent and Spencer, and

that it did not substitute a single judge of intellect so vigorous or learning so profound; when we reflect that William Curtis Noyes went down at this age in the full vigor of his professional life, and that Walworth and Bronson were never more laborious than after they had passed this limit; and, finally, when we see that in the English as in the United States courts there is never an old judge whose work is not done, and better done than by new men, we may conclude that the State of New York, like other bodies politic, may safely abandon its apprentice system, or, at least, had better make some arrangement for employing its judicial workmen after they have ceased to be apprentices, and not, as now, discharge a good hand as soon as he has learnt his trade.

When the judges of our Supreme Court are elected on a State ticket; when all the judges of the State hold office during good behavior; when judicial elections are rare, coming only to fill the vacancies which death occasions; when the eminent lawyer may give up his practice without the fear of the political caucus and the uncertain election; when the enlargement of the county courts has strained from the circuits a large mass of little matters, then the office of the judge will be again dignified and exalted, and then we may hope not for the certainty of law, for while human judgments err that can never be attained, but for the prompt administration of justice.

EUROPEAN POLITICAL CATCH-WORDS.

THE political life of every civilized people develops a greater or less number of terse, nervous phrases that at once become the property of the nation and are in the mouths of all—the "household words" of politics. Every crisis or marked epoch in the nation's history thus leaves, as it were, its high-water mark, planting it in the phrases of the people, and thus more surely preserving it than if it were recorded in written annals. Every such crisis culminates in an actor who gives the highest expression to its ideas, and embodies them in those pithy formulæ that speedily become as proverbs and pass into the warp of traditional history, an imperishable possession. Everybody remembers Mr. Seward's "irrepressible conflict," Mr. Lincoln's "big job," General Jackson's "The Union must and shall be preserved," Mr. Monroe's "era of good feeling," etc. In the single word "contraband" General Butler wrote a page of our history as vivid and as clear as if he had dipped his pen in one of the sun's quick pencils. General Sheridan appears to have given us another such word in "impediment."

We of America are prolific even to slang in these "winged words," even as our political life is more feverish and rapid than any other; but the European nations possess such a treasure of like utterances, of solid and enduring worth, compared with many of our own, as serves to give us a higher idea of the hold politics has taken on the masses than we are in the habit of entertaining. One is forcibly struck, though, with the courtly origin of most of these European phrases, as distinguished from the unmistakably popular source of most of our own.

A recent German writer has taken the pains to make a large collection of these political proverbs, and from them we select the most prominent and such as possess the most interest for the American reader. To begin with Germany herself, it is readily apparent at the first glance that she, wedded to the past and slowest of all civilized European peoples to catch the thought of the present, does not offer a rich store to reward the search of the seeker of phrases. One of the oldest is that which speaks of the German Empire as a "chaos preserved by the grace of God" (*confusio divinitus conservata*), and to the devout loyalists of that time nothing seemed so potent in inciting that chaos as the senseless talk of the people about "German freedom" (*germanische Freiheit*). These ideas of "German freedom" it was that ripened at last into "Particularism" as it curses Germany to-day, and has required a Bismark to stamp it out. To preserve their "German freedom" the one-acre princes and princelings of that unhappy country have time and again gone to war with each other, and even called in the help of the foreigner. Strange as it may seem, this phrase is attributed to Frederick the Great, who, if he was anything, was a hater of German feudalism. From the time of Frederick the Great, too, dates the talk of Prussia as "the natural ally of France." This was revived in 1805 when Prussia took Hanover from France. Up to that time Prussia had needed the aid of the French against the Empire, but to-day she is anything but France's "natural ally."

1815 brought Germany and Prussia again to their feet; but all the smaller states and Hanover, so little had they learned from the disastrous workings of the idea of German freedom, sought in the Congress of Vienna to have the Empire reinstated. They saw in it the only possible nursery of their cherished Particularism. It was not long after the overthrow of Bonaparte that a Prussian minister of the interior invented the famous expression, "the subject's limited understanding," laying therein an egg that Bismark has hatched in making a constitution for Germany in which he allowed no amendments. Demagogical, Catholic South Germany responded with an equally fatal utterance, "Particularism is freedom."

In 1841, M. Thiers, as a member of Louis Philippe's cabinet, began the unaccountably relentless war upon Germany that he has continued to this day, leading on his countrymen under the specious war-cry, "France's natural boundaries," and from that time Germany began to see more and more the necessity of union and a united defence of the Rhine. Then originated the two catch-phrases that have become so powerful in the mouth of Bismark as explained and enforced at Sadowa: "German unity," and Prussia as "the greatest pure-German state." The change from "German freedom" (*germanische Freiheit*) to "German unity" (*deutsche Einheit*) was most wholesome. (Our single word "German" does not fully express the difference in the phrases.)

The electric current that in 1848 ran over all Europe kindled into life the Frankfort Parliament, and from that body, otherwise one of the most barren in results that ever met in Germany, sprang three remarkable phrases that the Germans will probably never let die. The first two were "Great-German" (*Grossdeutsch*) and "Little-German" (*Kleindeutsch*), as synonyms for Panteutonism or the Union party, and Particularism or the Separatists; and the other was "The children of Germany's grief" (*Schmerzenskinder*), as applied to the Austrians. In that one word there is crowded a world of historic truth, such as our less ductile language must employ a combination of words to express. Since 1848, too, there has been a vast deal of idle talk in Germany about "democratic freedom" as opposed to "German unity," and this "democratic freedom," which meant the same thing there that "state sovereignty" does here, agitated matters until Germany was plunged into a war, in the midst of which the "blood and iron" man towered up head and shoulders above all that stood about him, and thrust Germany forward, sorely against her will, in the way toward that "German unity" of which they had vaguely talked and dreamed.

As Prussia has been most active of all the German states in all that has tended to make the nation united and politically respectable before the world, so she has also given to Germany most of its significant proverbs, and there are some that she would now gladly retract and cause to be forgotten, if it were possible. Thus the famous phrase, "Prussians of the second class," as applied to her allies in North Germany, originated by Bismark in one of his speeches, has become one of the most unfortunate in her history. It is one of the most potent instruments against her in the mouths of South German demagogues, who are not slow to warn their hearers that, if they enter the North German Confederation, they will become "Prussians of the third class." There are millions of Germans to-day for whom the threadbare "We will not be Prussians" is the head and front of patriotism. Despite all opposition, however, the four proud words, "I am a Prussian" (the first words of the Prussian national hymn), are continually advancing southward. In the Royal Theatre at Florence an ex-Hessian bitterly upbraided an armless Prussian officer for the part he had taken in despoiling his native country; but when the police came to arrest him, there sprang involuntarily to his lips, as he drew himself up in disdain, "I am a Prussian."

But it is France that—as might be expected—yields most richly these fine gems of speech. Going back to the time of Louis XIV., we find the government of the French kings designated by the wits of Paris as a "despotism modified by doggerel." The numerous mistresses that ruled in the courts of the Bourbons gave rise to the proverb, "Under a king, the women rule; under a queen, the men." When *le grand monarque* said, "I am the state," he probably did not foresee that, as afterwards happened, his utterance would become one of the catch-words not only of French politics, but of the world. The Revolution found no truer formula than "war to the manor-houses, peace to the cabins;" but in Vendée they burned about as many huts as châteaux, and the guillotine in Paris proved more than once that the blood of peasants was no thicker than that of kings. After the guillotine came the rule of the sabre, and Bonaparte drove the Council of Five Hundred out of their "talking-barracks," as he put it. The young Corsican became an emperor, and needed a new aristocracy in place of that he had destroyed; but the brevity of their genealogy lay heavily upon them and found expression in the ingenious declaration of a duke whose lineage, as such, could be traced no further back than to the field on which he won his marshal's baton: "I am myself an ancestor." Bonaparte himself felt keenly the deficiencies of his parvenu estate, and in a serio-comic tone cried, "Would I were my grandson!" To Talleyrand the French are indebted for "legitimacy," as well as for an uncounted multitude beside, among which we will only mention his "Words were made to enable us to conceal our

thoughts," and "I never talk about what I understand" (referring to affairs of state).

After the fall of Bonaparte there returned, among the Bourbon princes, the easy-natured Count of Artois, to whom is attributed the expression, "It 's only one Frenchman more" (*il n'y a qu'un Français de plus*), the best thing ever said by a Bourbon—but then he never said it. Then came the phrase, as applied to them, that has become the property of the world: "Nothing forgotten, nothing learnt." Presently Charles X. became simple Count of Artois again, and then there was "only one Frenchman" less.

The Revolution of 1830 introduced new phrases of its own; with "the constitution that is retained" came the "Republican king" (le roi-citoyen, not le roi-bourgeois) Louis, the well-beloved, whose motto was, "Keep cool." He carried his umbrella under his arm in Paris eighteen years, or thereabout, and then one dark night he—the umbrella still under his arm—mounted a common fiacre that stood at the base of the Egyptian column in the *Place de la Concorde* and drove away out of Paris, and Louis Napoleon has meanly neglected, to this day, to bring his ashes home to let them rest beside the Seine.

France—like history—repeats itself, so after the Republic came Bonapartism and then Napoleonism. The Republic, however, lived long enough to turn the world upside down and set the rivers in a blaze with its magic "liberty, equality, fraternity." In 1841, Thiers had put in the mouths of Frenchmen a new battle-cry, "Our natural boundaries;" but the policy of Louis Philippe was "Peace at any price," and the great orator's finely moulded periods fell to the ground. Under the new régime it seemed likely that he would accomplish little more against his old enemies, the Germans, for the Prince President in 1851 went to Bordeaux and made his famous announcement that "The empire is peace." Nevertheless, that has not prevented Europe from fighting three great wars since then, in two of which France was the instigator. Next came the complacent imperial utterance, "When France is satisfied, Europe is quiet." At Auxerre, in 1866, the Emperor announced to a startled continent, though it has since assented, "The treaty of 1815 is dead," and none more than the Prussians have hastened to take advantage of this assurance. Louis Napoleon meant to say he had broken it, but did not wish to tell the Germans they also might. At Sadowa the Prussians gave it so smart a wrench that he would fain withdraw his unguarded words and cause them to be forgotten. Since Maximilian (who, by the way, had precisely as much French blood in his veins as German) offered his breast to the cowardly Mexican rifles, we have heard no more of "the Latin race," and Europe, hitherto accustomed to await with open eyes and mouth the utterances of the oracle on the Seine, received its last, the pompous announcement of the "crowning of the edifice" of French liberty, with all but universal scoffing.

PARIS GOSSIP.

PARIS, August 9, 1867.

THE suit spoken of in my last as likely to be brought against Mr. Home by Mrs. Lyon, for the recovery of £60,000 given by her to the celebrated "medium," on his adoption by her, has commenced. But public curiosity is a good deal disappointed by the fact that it is in the Court of Chancery that this curious affair will be investigated and judged; for the proceedings of that court are conducted exclusively by writing, all the evidence being submitted in the form of affidavits—no pleading, no questioning and cross-questioning of witnesses, ever taking place in the prosecution of the suits submitted to its decision. Written evidence in support of the reality of the "phenomena" which are declared to have occurred in the course of the adoption and dotation of Mr. Home by Mrs. Lyon is understood to be pouring in upon the learned officers of the high court in question, and one can well imagine the amazement and embarrassment of those big-wigged and dignified functionaries at finding themselves thus called upon to decide whether chairs and tables did really move about a room and rise into the air without any one's touching them, and whether the spirit of the lady's deceased husband was, or was not, by communications transmitted through the tables and otherwise, her sole prompter and counsellor in the adoption whose effects she now seeks to undo. One can also understand how greatly their sense of the heterodox character of such a suit must be intensified by finding that Mrs. Lyon, so far from disputing the fact of the alleged communications from the other world, fully admits their reality, but affirms that they were produced not by the spirit of her husband, but by the agency of evil and lying spirits, suborned by the great medium to further his private ends.

While the much-disputed claims of modern spiritualism are thus being brought so prominently before the English public, an analogous sensation of surprise has been created on this side of the Channel by the appearance of a pamphlet entitled "An Enquiry into the Causes of Atheism, by a Catholic," and dedicated to the Archbishop of Paris, in reply to a recent homily put forth in regard to the decline of faith among the French people by that prince of the Gallic Church. The pamphlet in question, published by Dentu, crammed with theologic lore, and known to be written by Madame Petit—an intimate personal friend and correspondent of the present Pope, and one of the most fervent Catholics in existence—assures the archbishop that the cause of the decadence he deplores is to be found in the failure of the Church of Rome to keep pace with the progress of humanity, and the provocations to incredulity resulting, first, from her fatal rigidity in maintaining "the bondage of the letter that killeth;" secondly, by delaying to undertake the new translation of the Sacred Canon, imperiously needed to purge its books of evident and admitted errors; and thirdly, her refusal to acknowledge and direct the unfolding of the intimate relations existing between the material and spiritual spheres, which the author declares to be now taking place in the order of Providence and to be the great fact of the present age. The consternation produced by the appearance of the pamphlet in question will be readily understood. Madame Petit has long been looked up to as the very incarnation of Catholic orthodoxy and personal excellence, and the fact of her intimate friendship with the Pope—who is said to have no other lady correspondent—has surrounded her with a halo of sanctity and venerability in the eyes of the Faubourg St. Germain and the Catholic party in general, all of whom are aghast at the spectacle of such doctrines emanating from such a quarter, and are enquiring of Heaven and of one another, "What are we coming to?"

Your correspondent's goose-quill having wandered so near the frontiers of the unseen would fain, before returning to the beaten track of mundane beings, make over to your readers one of those incidents which most people like to hear of, even if only to laugh at them afterwards, and which has the double merit of having come to me very nearly "at first hand" and of offering certain peculiarities not always met with in "ghost-stories."

My friend, Colonel Sir William D——, an officer in the British army, having seen much service in various parts of the world, has been for some time past residing in Paris with his family, consisting of his wife, two sons, and a highly accomplished and charming daughter. From Sir William and his daughter I have the following story, which I give—changing only the names and initials of the parties—exactly as they told it to me a few evenings ago:

The eldest son, when pursuing his studies, a very few years since, at the Military College of Sandhurst, near London, was on intimate terms with another of the cadets, whom we will call Hartly. Young Hartly was a general favorite in the college, a promising, active young fellow, fond of the sports usually played by young men in England, and especially addicted to cricket. One Saturday afternoon, young Hartly having been absent for some time from the college on a visit to his parents in London, the pupils all turned out for a game of cricket. It was a fine sunny afternoon; the cricket-ground was full of animation, and the game was going on merrily. Presently, to the surprise and satisfaction of all the pupils, young Hartly was seen to enter the ground, dressed as usual, and looking in all respects exactly like his usual self. He went up to the ushers and shook hands with them, and with a number of the pupils. All present appear to have seen him perfectly, and to have felt pleased at seeing him come back. Presently he threw himself on the ground, took a cigar from his pocket, lighted it, and began to smoke, watching the game, meanwhile, with his usual interest, and every now and then commenting upon its progress, criticising this stroke, applauding that, and seeming as intent on the game as any of the players. At length he suddenly drew out his watch, and started to his feet, exclaiming, "I am wanted in London at four o'clock, and I must be off at once, for I have but just time to catch the train," and rushed from the ground in the direction of the railway station. Much surprised at so sudden a departure, several of the pupils took out their watches and discussed his chances of being in London by four o'clock, as it then wanted but a few minutes of that hour.

Next day brought to the astonished inmates of the college the news of young Hartly's death, which had occurred the preceding day at his father's house, *exactly at four o'clock*. He had fallen ill during his visit home and, as was afterwards ascertained, had not once left his bed from the time of his falling ill. It was also ascertained that during the whole of that last day, through which he lay in a sort of quiet stupor, his mother had never left his bedside. "We 've seen a real apparition for once in our lives!" was the shuddering admission of the cadets when the news of Hartly's decease reached them. But the awkwardness of such an admission, and the impossibility of classifying or explaining so inconvenient a fact as the visible and tangible presence of their comrade on the cricket-ground while he was

really dying in his bed in London, were too obvious not to produce a certain reaction; and so it came to pass that, in course of time, the cadets gave up the idea of having "seen an apparition," and settled down on the more convenient hypothesis of an "hallucination." A few of the number, however, of whom young D—— is one, persist firmly in their first belief in regard to this remarkable incident, and stoutly declare that they did see, touch, and hear the perfect image of their friend, though utterly unable to explain the nature of such an appearance.

Almost as incredible, at first sight, as the incident recorded above, is the fact that the guests of the Abbé Denis, curate of the parish of St. Eloi, in the Faubourg St. Antoine, dined a few days ago on fowls whose immediate ancestors figured, he says, on the table of the great Frankish King Dagobert. When the Abbé Denis laid the first stone of the church and presbytery he has built, by his own exertions, on the site of the old château and gardens of Dagobert, a hen's nest full of eggs was discovered beneath the ruins of the ancient building. These eggs, more than twelve hundred years old, were about to be thrown away by the laborers, when the abbé, remembering that wheat has been grown from grains found in Egypt in mummies dating from the time of the Pharaohs, bethought him that possibly there might still be life in these eggs. A *savant* of the Institute, consulted at once in reference to these precious relics of an age when there was as yet no France to detest "Perfidious Albion" or to be jealous of Prussia and needle-guns, advised their being forthwith confided to a hen of approved success in the maternal capacity. This advice having been acted upon, the good curé and his friends had the delight of witnessing, twenty-one days afterwards, the hatching of a fine brood of chickens, the direct progeny of the denizens of King Dagobert's barn-yard. The fowls thus obtained have been carefully kept from any *mésalliance* with their congeners of less ancient blood; and the abbé has now a yard so well replenished with "King Dagobert fowls" that he not only supplies his own larder with poultry of this illustrious breed, but is about to organize, at the suggestion of numerous friends, a sale of "King Dagobert eggs" for the benefit of the poor of his parish.

Meantime, the representatives of modern royalty are still bestowing the light of their "august" countenances on this city, viewing and reviewing the inexhaustible marvels of the Exhibition by day and honoring the principal theatres in the evening. Last night the King of Sweden and the Grand Duke Constantine of Russia were applauding Offenbach's "Grand Duchess" at the Variétés; the Queen of Portugal was seeing "Mignon" at the Opéra Comique; and the Crown Princess of Prussia was at the Odéon applauding the 199th performance of George Sand's dramatic *chef d'œuvre*, "Le Marquis de Villeneuve."

Correspondence.

HINTS FOR A JUDGE—BY AN ARTISAN.

To the Editor of The Nation:

Having read the article on "Hints for Constitution-Makers," by a judge who shares the popular delusion that persons who do not own "property" (I infer houses) do not pay taxes, allow me to ask, through your columns, who is it that pays the "*local* tax" if it is not the tenant? When a man either builds or buys a house to let, does he not take into consideration the amount of taxes he pays as well as the capital he invests before deciding upon the rent of his premises? It is very fine to call the class to which I belong the "non-tax-paying rabble," in order to filch me of my right to vote because I do not pay the "*local* tax" direct. I have to work one day and a half to earn sufficient to pay my weekly rent. The judge says that "capital has few votes, and it therefore resorts to the only means which it possesses—it *corrupts*"—by sending representatives from the gambling-hells, stock exchange, railway directors, iron-masters, manufacturers, lawyers, and other representatives of capital, but labor, physical labor, *none!* So the judge is not satisfied to degrade and corrupt with his money the "non-tax-paying rabble," but desires to rule the exchequer of the truly tax-paying people without their consent. If the "rabble" are so venal, let the judge and his class (for he makes the distinction) see to it that they are better educated by educating the representatives (so called) of the people to honesty in legislating.

S.

[But "S." can move into the country if he pleases, and as thousands are doing, while the real property-holder has to stay here and meet the tax-collector.—Ed. Nation.]

PARKMAN'S JESUITS.

OPINIONS OF THE PRESS.

"To other most important qualifications for his task, Mr. Parkman joins a simple, forcible, pleasing style of composition, and uncommon skill in the grouping of the incidents which he has to relate."—*New Englander.*

"A work we can commend as one more absorbing than a romance, and equalled by few histories in graphic clearness and power of commanding the reader's sympathy and confidence."—*Round Table, N. Y.*

"The result of these painstaking efforts is shown in the production of a work which is likely to remain a standard authority. . . . The reader once beginning this narrative will read to the end. The picture is strikingly painted, and the interest always sustained."—*N. Y. Evening Post.*

"By this admirable volume the author has made all American readers more than ever his debtors."—*Philadelphia Inquirer.*

"A picture of the past, fairly rivalling the histories of Prescott, both in originality of research and admirable simplicity and purity of style. It has a charm of personal narrative about it such as few works of the kind possess."—*Philadelphia Ledger.*

"As we are borne along with the rapid movement of a narrative which kindles the blood, and fills the imagination as well as informs the understanding, we forget with what toil the materials for so consecutive a story must have been collected and arranged; but the research implied in every glowing chapter of Mr. Parkman's volume would alone have been sufficient to give him a deserved reputation."—*Boston Transcript.*

"Mr. Parkman's descriptions of Indian life are unsurpassed by anything of the kind. Few subjects are more attractive than the one upon which he is laboring, and, for the success with which he has thus far treated it, he deserves to be ranked with Prescott and Motley."—*Boston Advertiser.*

"M. Parkman possède un style pur et plein de charme; il narre avec chaleur, et trace les caractères de main de maître. En bien des endroits il rappelle l'écrivain américain Prescott."—*Journal de Quebec.*

The Week.

The Presidential trouble has made no progress since last week. The only move of importance has been an "opinion" from "Acting Attorney-General Binckley," justifying General Sickles's removal. It is not worth making a summary of, as nobody believes that it furnishes the real reason of Mr. Johnson's course, and Mr. Binckley's standing as a lawyer is not such as to render his "opinions" of much value in themselves. Mr. Johnson has shaped out for himself a certain course with reference to the whole Radical party and its policy, which he would doubtless pursue on grounds of expediency or from personal feeling if there were no Attorney-General in existence. The "opinions" that he produces from time to time are pleasing little forms, intended to conciliate or satisfy the more weak-minded portion of the public.

Mr. Johnson has issued another proclamation in which he delivers a ludicrously solemn homily on the sanctity of the Constitution and the laws, cites the provision of the Constitution which authorizes the President to employ the land and naval forces for the faithful execution of the laws whenever it shall, in the judgment of the President, become impracticable to enforce them by the ordinary course of judicial proceeding, "by reason of unlawful obstructions, combinations, or assemblages of persons, or rebellions against the government"—and naturally applies all this to General Sickles in South Carolina, calling him an "impediment and obstruction of a serious character;" calls on the people to obey the laws and testify their devotion to the country, and warns Sickles and all others from "hindering or obstructing" any more. Mr. Johnson has done many odd things, but this is perhaps the oddest—is, in fact, too odd to be amusing. The composition bears all the marks of the now famous Binckley's hand, and it is quite evident that if he is allowed to go on much further, he will, to use his own thrilling language, "grasp the heart-strings of public order." We shall only say that we think this last performance will furnish Congress, when it meets, with abundant reason for considering seriously whether Mr. Johnson's mental condition is such as to render it safe to leave him any longer in possession of his office.

It has been suggested to us as a reason why General Grant should remain in the War Department, even if his position does seem a false one, that his presence there prevents the passage of an enormous number of fraudulent "claims," with which hundreds of speculators stand ready, waiting for the committal of the department to the hands of somebody whom they can manage. There is doubtless something in this, and it is comforting to think that, by the terms of the Tenure of Office Act, General Grant can not be displaced till Congress meets. We are satisfied that he has done all that he has done from the best of motives; and that he is determined not to yield an inch of his legal authority is apparent from his order forbidding the restoration to office of persons already dismissed in the departments of the South.

"Acting Attorney-General" Binckley says, at the close of his opinion, that for "the sole executive to suffer the judiciary to be overthrown, would be practically to overthrow himself," and he adds "that *contempt of law indulged speedily grasps at the heart-strings of public order.* So teaches history." Mr. Binckley must have experienced sensible relief after cleansing his bosom of such perilous stuff as this. According to the well-informed correspondent of the Boston *Advertiser*, Mr. Binckley is an adventurer whose connection with the Government and intimacy with the President indicate such demoralization at the White House as was not surpassed in the days of Pierce and Buchanan, and hardly when Jackson was deep in the Texas conspiracy.

Many Republican leaders are so far wincing under the Democratic attacks on the national credit as to express willingness to have the United States bonds made subject to State taxation. They of course acknowledge the right of the present holders to exemption, but propose a fresh issue, to be given in exchange for the bonds now outstanding. We have as yet seen no plan, however, for arranging the rate of exchange. A national bond subject to State taxation would be an article of very inferior market value to one not so subject; and on what terms ought a holder of the latter to be compelled to take the former instead? Ought he to be compelled at all? Would not good faith require that he be presented with the option of being paid off, if he does not like the conversion? For those who propose to engage in the business of tinkering the national debt, *obsta principiis* would be a very good motto—and no Congressman will think the worse of it for being expressed in a learned tongue.

The fact, which is now no secret, that Chief-Justice Chase is the favorite candidate of the Radicals for the Presidency, has, during the last week or two, led to a pleasant and edifying discussion in the newspapers regarding the amount of that gentleman's income, which some of the Democratic organs represented as something fabulous. The result was that he made known the exact amount of his fortune, or, strictly speaking, offered to "sell out" to anybody who would agree to pay his debts for the round sum of one hundred thousand dollars. His slanderers have thus been silenced, but we have no doubt that most thoughtful men will agree with us when we say that an amendment to the Constitution forbidding the chief-justice, or, in fact, any judge of the Supreme Court, from ever holding any other office in government, would be a national gain. We will go further, and say that all the good Chief-Justice Chase has done by his political services since his accession to the bench has been very dearly bought by the manner in which it has been necessary for him to render them. We trust, too, that the mental constitution which makes the holder of such a position as the chief-justiceship of the United States—we know of no other equal to it in the world—long for one which an Andrew Johnson can win and fill, is singular and rare, and will long continue to be so.

The canvass in Ohio is calling out some really excellent speaking, more argumentative than has been heard from the stump since the days of the free-soil agitation. Senator Morton and Mr. Shellabarger have both, during the past week, delivered addresses which—with, of course, a fair amount of rhetorical defects—were exceedingly powerful; and perhaps what is most gratifying in them is the loftiness of the motives to which they appeal. This contrast in *tone* with the speeches of the leading Democrats is striking enough to make one who knew nothing of the circumstances doubt whether they could be all addressed to the same community. If anybody will take the trouble to run through Morton's and Pendleton's, for instance, he will find Morton constantly appealing to the popular sense of honor, love of country, regard for its fair fame, self-respect, love of justice and of equality, humanity, readiness for self-sacrifice, and so on through the whole range of generous passions, while Pendleton appeals as constantly to self-interest in its very lowest form, and talks throughout as if such a thing as a man's doing a thing that caused him loss or discomfort had never been heard of. We think that even Thomas Carlyle would not despair of democracy if he could be made acquainted with the nature of the arguments with which that to him lowest of all animals—the stump-orator—here seeks to persuade the majority of the Northern people.

The remarkable identity of the views expressed in the recent article in THE NATION on the "Judiciary" and those subsequently set forth in the report of the Committee on the Judiciary in the sitting Constitutional Convention of New York, renders it proper to say that the writer of these articles has held no intercourse directly or indirectly with the committee or any member thereof, and was in absolute ignorance of the conclusions at which those gentlemen had arrived. The common conclusion was reached without consultation by a separate contemplation of the existing evils to be reached and impediments to be overcome. Yet it must be regarded as a very great blot upon the report of the majority that the city of New York is left as an independent elective judicial district, that the needless and ridiculous multiplicity of local courts is allowed to disturb the unity and harmony that might and should exist in each judicial department, and that the strength and dignity of the General Terms are not made secure and certain. It is also suggested that a recent dangerous and degrading statute which allows a justice of the Supreme Court to sit as a referee of his own tribunal, and to receive private pay from suitors as an inferior officer of his own court, be for ever stricken out of the laws of New York, and that the time and services of judges who hold office to the age of seventy be declared to belong wholly and exclusively to the public. A more pernicious means for covert bribery than this statute presents, no enemy to the judiciary ever devised. Its apology was the niggardly salaries paid to the judges, but its authors forgot that justice should be absolutely free, and, indeed, that the whole system of privately-feed referees should be cut up root and branch.

There appears to be an emigrational movement from some of the more Southern States into Maryland. It is an accession which, in its influence on politics, is likely to be welcome to the reactionists who already control the State. A writer in the Louisville *Journal* invites a similar emigration, not to Kentucky nor yet to Brazil, but to California. In that land he himself sought refuge after serving in the Confederate army, and the "situation" of the South seems to him to resolve itself into a general "*sauve qui peut*." The first attraction of the Pacific Coast is, that "the negro is not there;" the second that "it will produce more breadstuffs, wine, brandy, and whiskey than any State in the Union, and there is no reason why its liquors should not be the best of their kind." Except for the absence of the negro, this should be the paradise of the Democracy. But perhaps Mr. Nasby could make shift with the Chinaman, who "refuses suffrage and office." At all events, let it not be written for nothing that "a few thousand Conservative [ex-rebel] emigrants can fix the political *status* in California on a solid basis." This is an end worthy the toil of escaping from military despotism. We are not sanguine, however, of the result. In the early settlement of California the experiment was tried. The South was nearer that territory than the North, and the roughest elements of the Democratic party joined her chivalry in the quest for gold. Brutality, crime, violence, lawlessness grew, held sway for several years, culminated, and then succumbed, while California rose as a free State. It is too late to reverse this decision; and the only good to be accomplished now by an exodus thither from the South, is to make room for honester, more industrious, and more loyal citizens, and to facilitate reconstruction.

We find in the Cincinnati *Gazette*, one of the ablest and most respectable papers of the West, the following pleasing announcement in a prominent position and on the first page:

"THE JONES-McCOOLE EXCURSION.

"TIME AND PLACE OF DEPARTURE.—All persons holding tickets or badges for the McCoole-Jones excursion, are notified to be at the Cincinnati, Hamilton, and Dayton depot at two o'clock, Saturday morning. Positively no tickets or badges will be sold at the train."

The "Jones-McCoole Excursion" was an excursion to witness a "set-to" between two of the greatest ruffians in the United States. A large train was furnished for the purpose by the obliging and gentlemanly president of the Cincinnati, Hamilton, and Dayton Railroad, and all the principal papers sent reporters. Under this sort of encouragement, as might be expected, "the ring" is rapidly becoming naturalized in this country, and we shall probably before long have to number it amongst our "institutions." It is, of course, of English origin; but its principal professors on this side of the water so far have been gentlemen of the Fenian persuasion, among whom it seems to occupy a rank somewhat similar to shooting and wrestling matches amongst the Germans. If the amusement is a respectable and established one, we recommend that our "chief magistrate" be invited to be present at the coming "mill" between "Jim Elliott" and "Mick McCoole."

The approaching visit of Charles Dickens is creating a discussion as to the manner in which he should be received, which shows that some of the foibles which he ridiculed are not entirely extinct. The greater portion of the press treats the matter in a very sensible and dignified way, but here and there we light on an "exposure" of Dickens's libels on the American nation in "Martin Chuzzlewit," suggesting the inference that he ought in some way to receive special marks of public displeasure, now that he is coming out a second time. We hope sincerely that if he should be run after, toadied, and caressed as he was on his last visit, he will write another libel worse than the first one. When a whole people go half-crazy over "a man of genius," the man of genius would be almost more than human if he did not make fun of them and abuse them. No such demonstrations are, of course, now probable, because the whole community has since then grown in good sense and self-respect; and we advise everybody who wants to hear Mr. Dickens to pay his money and do so, and those to whom Mr. Dickens is specially commended, or on whom he has special claims, to treat him politely, and every one else to let him alone. We may add that it is very unlikely that he will be able, during his stay here, to find time to give written advice to young women on their marriage, or on the cultivation of their minds—a task which "men of genius" are only too frequently called on to perform.

Dr. Lieber has addressed a memorial to the Constitutional Convention of this State recommending the abolition of the rule requiring unanimity in jury trials—showing that it is not required in any country in which the jury is in use except England and the United States. The French, German, and Italian rule, he says, is that if there are seven jurors against five, the judges retire, and if the bench decides with the minority the verdict of the minority is taken, while it requires eight jurors out of the twelve to give a majority verdict. This plan he condemns, as opposed to our theory of the judge's position, which is that of an umpire. He proposes that the jury shall consist of twelve jurors, but that a majority of two-thirds shall be competent to give a verdict. We would suggest a change similar in principle, which would probably be more consonant with the popular taste or prejudice. The feeling in favor of having at least twelve men give the verdict has no doubt come down from the time when jurors were quasi-witnesses, and when it was felt not fair to punish a man unless at least *twelve* good

and true men thought him guilty; but, whatever its origin, it is deeply rooted. Why not defer to it, by putting eighteen men on the jury, and making twelve necessary to a verdict?

The appearance of the yellow fever in New Orleans with great virulence proves what military rule did for the city during the war. It has no sooner been committed to what are called "the municipal authorities" than the old plague reappears. The outbreak will hardly displease the Secessionists, however, as the victims are, of course, mainly Northerners.

The Cable informs us that Lord Stanley proposed in May last to submit the Alabama claims to arbitration if the commission claims of British subjects for loss and damage during the late war were submitted to the same tribunal. The Washington correspondent of the Boston *Advertiser* indirectly confirms this story, by alleging that no communications on this subject have passed between Mr. Seward and the English minister for several months. This might, of course, mean since last May. The probabilities are that Mr. Seward will let the matter lie for an indefinite period; but there is probably no truth in the story that the existence of this negotiation will exercise any influence on his position in the cabinet. His staying in or going out will probably depend entirely on the exigencies of Mr. Johnson's home policy.

The English reformers are now pressing for the ballot as the complement of the late extension of the suffrage. They say that only through it can the new voters be protected against intimidation and corruption; but it is doubtful whether they can be protected even in this way. There are plenty of means, as everybody here knows, of learning how a man votes even with the ballot. The real obstacle to electoral purity in England is not the open voting, but the anxiety of men newly enriched to secure seats in the House of Commons as a means of acquiring social position for themselves and their wives, and the enormous power which the great land-owners possess over the comfort and prosperity of everybody living on their estates. They can, anywhere out of the large towns, ruin a shop-keeper or artisan, or drive a laborer to the workhouse, and as long as this is possible it is folly to suppose that furnishing a man with the means of concealing how he votes will materially help him. In the great towns the ballot would undoubtedly be a protection for workmen against employers, and it might render rich candidates more cautious in their expenditure, but the evil lies after all in the constitution of English society, and this will only change slowly even with a reformed Parliament.

Everything we hear from England tends to confirm the view we took last week of the political significance of Queen Victoria's story of her married life. The wretched scandal which has been for some time in circulation about a personage known as "John Brown of Scotland," a favorite servant of Prince Albert, has at last found expression in an outrageous cartoon, in an illustrated comic paper called *The Tomahawk*, representing Brown standing beside the throne, with the Queen on it, with a pleasant smile on his face, and the British lion looking up at him tenderly and affectionately. To the Queen Brown is, of course, simply a relic of the Prince—like a horse or a dog; but she retains him about her, and treats him with a familiarity which, towards persons of his position—that of a groom—is very unusual, and to English conventional feelings rather shocking. Landseer has been employed to paint "The Widowed Queen," in which Brown figures full length. Now, the imprudence of all this only excites regret amongst the upper classes, and if it elicits any remarks at all, elicits it in very respectful and even pitying language. But the rank and file are not likely to be affected by it in this way. Nothing can be more dangerous, just as the working-classes are entering on the political arena, than to have the monarch held up to them as an utterly inconsolable widow, who, five years after her husband's death, devotes her whole time and attention to the invention of new marks of respect for his memory. Moreover, the picture drawn in the Prince's memoir of the life led by the royal pair will set many a poor man asking what they did to merit so much of the happiness which this world has at its disposal; and, behind this, the question of the *use* of a monarch at all will, we may be sure, follow closely. Unless we are greatly mistaken, England is on the eve of very great changes, of which this generation will probably not see the end, and of which the peculiar position in which the royal family is placing itself is probably one of the first indications.

One of the most extraordinary charges of literary or artistic fraud ever made is now under discussion in England. Sir Charles Barry, as everybody knows, was the architect of the Houses of Parliament at Westminster. He was knighted for his services, and made fame and fortune out of them, and is dead. Now come the sons of Mr. Pugin, perhaps in his day the first Gothic architect in the world, and offer to prove from their father's journal and other documents that their father did all the work for the building for Sir Charles for the small sum of £400, while Sir Charles took all the credit of it before the world.

The German States begin to find the Prussian yoke in some ways a heavy one. The little Duchy of Saxe-Coburg made an agreement with Prussia some years ago to give her its military contingent to the federal force, and paid her $60 a man for its support; now the Duchy has to pay nearly $140 a man. Others pay a still greater increase. One of the most striking features of the revolution is the working of the federal universal suffrage, on which Bismark has insisted. In the old Prussian provinces, where the great landed proprietors and the civil functionaries still exercise great influence, the conservatives carry the day. In the new annexations, the general dislike of the new master has caused the old conservatives to unite with the radicals for the purpose of testifying their hostility to the government. In the South German States the governments have refrained from exercising any influence whatever on the voting, and local feelings or interests have generally decided the election. One incident is both interesting and, to us in America just now, very instructive. In Mecklenburg, society is still in a condition bordering on pure feudalism. The peasants are still retained in a sort of serfdom, and know nothing and care nothing about questions of general politics. But, curiously enough, they managed to find out which candidates were most disagreeable to their lords, and accordingly cast their votes in a solid mass for the radicals. We are likely to witness a very similar result amongst the negroes at the South.

Things are not going well in Hungary, in spite of the convention and the restoration of the constitution. The intense anti-Austrian feeling of the radicals again begins to show itself. General Perezel has been elected to the Diet immediately after delivering a violent tirade against the Austrians at Pesth, and General Türr has declared himself against the ministry in a strong circular. The probabilities are that the ministry will resign. It has apparently no policy except the revival of the honveds, or national militia, and an alliance with France so as to keep out the Russians. But an alliance with France would be of very little value for any such purpose. If Russia should again make a movement against Hungary, it would be as a piece of Panslavish propagandism, and would have the support of the Sclavonic population of the Austrian Empire, and against this the Magyars would be powerless.

It is now officially announced by the Turkish Government that the Cretan war is at an end. We are not at all surprised to hear this news. The wonder is that the Cretans were able to keep up so long the delusion that they were succeeding. They never had the ghost of a chance, unless they secured the aid of some Western power—not even if they had secured the active co-operation of the kingdom of Greece. Turkey is not a very powerful antagonist, but she has a regular army of considerable strength, arsenals, a treasury and a navy; and the attempt of a few thousand mountaineers to make head against a power of this kind must in our day fail. The risk of foreign interference which the Porte has run all through the Cretan trouble, combined with the Sultan's visit to Christendom, will doubtless now lead to some real reforms in the Turkish government; but we confess we have little expectation that they can or will be carried out with any such instrumentality as the Sultan has at command.

Notes.

LITERARY.

MESSRS. J. B. LIPPINCOTT & Co. have in press "Annals of Philadelphia and Pennsylvania, in the Olden Time," by John F. Watson, in two volumes 8vo, illustrated, designed among other things to "exhibit the city and country in their local changes and improvements;" "A Sunday Library for Household Reading," prepared by eminent American and English divines, illustrated; "The Restoration at the Second Coming of Christ," by Henry A. Riley, being a summary of millenarian doctrines; "Fighting the Flames," a tale of the London Fire Brigade, by R. M. Ballantyne, illustrated; "Beatrice Boville, and Other Stories," by "Ouida;" and Bulwer's "Devereux," Globe edition.——Messrs. D. Appleton & Co. announce for this month, "The Wit and Wisdom of Don Quixote," a selection of the choicest proverbs and witticisms of that great work; "The Human Element in the Inspiration of the Sacred Scriptures," by T. F. Curtis, D.D., containing a synopsis and review of all the chief modern theories of inspiration extant; Herbert Spencer's "Principles of Biology," Volume II.; "Home Life: A Journal," by Elizabeth A. Sewell; a new edition of "The Iron Manufacture of Great Britain," by the late Mr. Truran; a new edition of "The Foreign Tour of Messrs. Brown, Jones, and Robinson;" "A New System of Infantry Tactics," by Brevet Major-Gen. Emory Upton, U.S.A.; and "The Daughter of an Empress," by Louisa Mühlbach, a novel pertaining to Russia. This is the ninth on the list of this writer's works as published by the above house, who have paid her one thousand dollars for the privilege.——Messrs. Leypoldt & Holt are to publish another tale of the year '13—"Le Conscrit de 1813," by Erckmann-Chatrian; a series of modern French plays, beginning with "Jean Baudry," by M. Vacquerie; a "Guide to French Conversation," by C. and W. Witcomb; "Easy French Reading;" "La Littérature Française Classique" and "Contemporaine," the former being lectures by Edouard Mennedvet; "Landmarks of History—Modern, and Middle Ages," by Miss Yonge; an Anglo-Saxon manual for beginners, by Professor S. M. Shute, combining a grammar, reader, and glossary; and Professor Corson's "Thesaurus of Archaic English," of which the subscription has so long been pending, to be issued in five numbers.

—Nowhere out of India, we fancy, could a parallel be found for the voluntary torture submitted to by the Mandan Indians in their religious ceremony called O-kee-pa, as described, with illustrations, by Mr. George Catlin in his latest book. It was a religious performance in which the young men who wished to be graduated as warriors were hung up in the lodge of the medicine-men by the muscles of the neck or breast, great weights of shields and buffalo skulls dangling from the muscles of their arms and legs, and then rotated till they fainted; the final trial being to run a miserable race till the dragging weights were detached from their lacerated wounds. Mr. Catlin witnessed this shocking ordeal in 1832 on the Upper Missouri. Mr. Schoolcraft doubted, but other travellers have corroborated, his account. Small-pox and disaster have since exterminated the tribe, and Mr. Catlin's narrative will probably cause little regret for their disappearance, although they are represented as friendly and hospitable, and could boast that they had never killed a white man. The history of superstition, however, would be incomplete without the revolting chapter which we have barely sketched.

—The best statement we have ever seen not only of the theoretical but of the practical workings of the joint education of the sexes is contained in a paper read in July by President Fairchild, of Oberlin College, to a convention of college presidents at Springfield, Illinois, and reprinted in *The Illinois Teacher* for August. No person, probably, could speak with more knowledge of the actual results of the system inaugurated at Oberlin, inasmuch as the president began as a pupil at the very opening of the college, and has had experience as a teacher in three quite distinct departments—the ancient languages, mathematics, and metaphysics—besides his present office. He narrates with great moderation and perfect dispassionateness the details of the college system, enumerates its proved advantages, and then investigates the drawbacks which might be supposed inherent in it. His conclusions, we need not say, are highly favorable to the plan pursued. It may still be asked why, if the advantages are or can be made so obvious, after a successful example of thirty-four years the college has not revolutionized the general practice of educating the sexes apart. Readers of Mrs. Dall's last work will find palpable traces of this revolution in the numerous institutions, patterned after Oberlin, which are to be found in the West. They have so far determined the fashion that it is doubtful whether any new State would establish a university for either sex alone; and to them may be principally due the readiness of the Western States to admit women to political equality, which we are sure involves a revolution in educational methods. To this equality, by the way, Prof. Fairchild intimates that he is by no means friendly, and however little logical his position may be, it enables us to recommend his address to many who would decline reading the arguments of a partisan of "woman's rights."

—The London correspondent of *The Tribune* calls attention to a work little known even in England: "Notes of a Twelve Years' Voyage of Discovery in the First Six Books of the Eneis," by Dr. James Henry. The author's ability as a commentator has been acknowledged by Mr. Conington, who has profited by it in his recent translation of the same epic. But the most remarkable feature of this persistent study is thus stated by Dr. Henry himself:

"I have been, as the title imports, twelve years, twelve of the fairest years of my life, engaged in this work; encouraged by no one, approved by no one, patronized by no one, receiving no particle of assistance either at home or abroad from any one of all the numerous persons who have, with more or less success, cultivated the same author, except alone the assistance which I have reared and created for myself in my own daughter, who has already, at the age of 22, arrived at such a degree of knowledge of the subject that I have not printed a single comment without first submitting it to her censorship. Many and valuable have been the suggestions I have received from her, although I have not specially stated the fact, except at Aen. II., 683," in the note on which he remarks: "I cannot refuse myself the pleasure of informing my readers that the above very new and, it seems to me, very true explanation of this difficult passage was suggested to me by one whose zealous assistance and co-operation has all along not only lightened but rendered delightful to me the otherwise almost intolerable labor of this work—I mean my beloved daughter, Katharine Olivia Henry."

—The most interesting literary announcement from England is, that the present Duke of Wellington is printing the whole body of his father's papers, for safety, not for publication. Everything will be put in type, and those passages which concern living persons too nearly will then be struck out. Three original impressions will be taken and preserved by the duke in three different depositories, of which he will not permit the British Museum to be one.——According to the London *Publishers' Circular*, "Mr. Charles Reade and Mr. Dion Boucicault are writing in conjunction a new serial story, which is to appear in *The Atlantic Monthly* magazine, the proprietors of which are said to have paid for it a larger sum than was ever yet paid by an American periodical to English authors for a story, with the exception, perhaps, of Mr. Dickens;" and the same authority announces a new monthly magazine to be edited by Mr. Anthony Trollope, and entitled *The New Metropolitan*.——Messrs. Sampson Low, Son & Co. announce for this month a volume on the "Christian Heroes in the Army and Navy," by Rev. Charles Rogers, LL.D. Havelock is one, of course; Stonewall Jackson is another; but we leave it for Dr. Rogers to say "of course."

—The Cable informs us of the death of two world-famous men, Dr. Velpeau at Paris, and Professor Faraday in England, almost of an age, being seventy-two and seventy-three respectively. By mail we learn of the death of Mrs. Sarah Austin, of heart disease, on the 8th ult., in the seventy-fourth year of her age. Her maiden name was Taylor, and her husband was Mr. John Austin, a barrister, and the author of a work on jurisprudence which has a solid and steadily increasing reputation. The deceased was chiefly known by her translations of German works, and *The Spectator* says of her, without exaggeration, that she was "probably the best translator from German into English ever known in literature." Her literary acquaintances were remarkable, and she held a salon which in some years quite equalled the best French examples.——Mr. Dickens is preceded in his visit to this country by the Rev. Charles Kingsley, whose sympathies during the late rebellion were not, perhaps, different from those of the author of "Martin Chuzzlewit," nor—which is the real grievance—from those of the leading men of letters in England, of whom, from Carlyle to the Poet-Laureate, we had a right to expect better things. Mr. Kingsley's connection with the Eyre defence is another drawback to our holding him in the highest esteem; but that is properly a home affair, and here he will scarcely be reminded of his admiration for Jefferson Davis. *Per contra*, the Rev. Newman Hall, a very able writer, and one of the staunchest adherents of the North in England, has just taken leave of his congregation prior to his departure for the country he has defended. He announced that he should do some pastoral work while here, and reviewed with praise the conduct of our Government in suppressing the rebellion and restoring the Union. His welcome cannot be doubtful. Still another distinguished visitor is Lord Amberly, eldest son of Earl Russell, who certainly comes with a handsome introduction from his father—the international apology at the Garrison banquet.——From Germany we may expect Fanny Janouschek, an actress of merit, who is to make a professional tour in this country from October to April, beginning in this city at the Théâtre Français, under the management

of M. Grau. Herr Hendricks, who in his favorite plays is excelled by no actor in Germany, will also solicit our applause.

—In a late number of the *Revue des Deux Mondes* is an article by the well-known publicist, Henry Blaze de Bury, entitled "Shakespeare and his Musicians." The writer is closely affiliated with German musicians, and is especially convinced of the musical importance of the "prophet of Munich," Richard Wagner, the composer of "Tannhäuser," "Lohengrin," "Rienzi," etc. He pitilessly exposes the decline of French music, and arraigns it for making of Shakespeare's characters, Goethe's Faust, and Schiller's Carlos inanimate corpses, on which to hang its miserable tatters. He charges the manufacturers of librettos with a "pure stérilité et impuissance," and pities the poor composers who condescend to thresh such straw. Unfortunately, the composers themselves were most to blame, for they sought out-of-the-way ideas and buried them under effect-straining situations, *bravura* pieces, marches, and dancing melodies, agreeable *entr'acte* music, ballets, and masquerades. Gounod is particularly censured as having transformed Gretchen into a Parisian grisette. The unworthiness of his new opera, "Romeo and Juliet," beside the treatment of the same subject by Bellini—to whom, however, the writer is not very favorably inclined either—is dwelt upon. Rossini in his "Othello" had been inspired at least by a spark of Shakespearian genius, but Gounod sacrifices feeling and character in order to make them the hot-beds of his parasitical creations.

—Among standard books of reference we notice in Germany H. Brugsch's "Hieroglyphic and Demotic Dictionary" (Leipzig: F. Klincksieck), which contains in their proper order the most-used words and word-groups of the language and sacred and popular writings of the ancient Egyptians, with their definitions in French, German, and Arabic. The first part has appeared, and there will be twelve in all, costing each about $6 25 in gold. In France we have the first instalment of Achille Juquin's "Dictionnaire général et raisonné de la Construction, etc." (Paris: E. Lacroix), embracing all that relates to public and private works, and the customs, laws, etc., which regulate them. This will be complete in one hundred parts, at the subscription price of forty francs for the volume. In England another work useful for all builders, and a recognized standard for a quarter of a century, is the new edition of Joseph Gwilt's "Encyclopædia of Architecture" (London: Longmans), edited by Wyatt Papworth, pp. 1,500, copiously illustrated. Gwilt was a great admirer of the classic models and of the Renaissance. His editor has accordingly had chiefly to add to the treatment of the Gothic, by doing justice to which he has greatly enhanced the value of the dictionary.

—The London *Chronicle* for August 17 has an able review (by Mr. F. J. Furnivall?) of Mr. Morley's "English Writers" (Vol II., Part I., Chaucer to Dunbar. London: Chapman & Hall), in which the final *e* of Chaucer and some obscure passages of the poet are discussed in a most interesting manner. It is gratifying to report a tendency in Germany towards the same studies, for which Mr. Morley deserves so much praise. We may cite in proof the "Specimens of Old English" ("Altenglische Sprachproben") edited by Eduard Mätzner, of which the first volume has reached this country. The second will contain an Old-English-German glossary of the period from the disappearance of the Anglo-Saxon as a literary language to the fifteenth century, occupying about 750 closely printed pages. It will investigate the etymology of words with reference to their Germanic, Scandinavian, and Romanic elements, and indicate inflections where they occur, with their accidental differences. The selections are all preceded by bibliographical introductions which discuss the questions of time, place, and author, as well as the state of the language or dialect. The first part contains thirty-eight pieces, of which we may mention two selections from "Orm," a poem on texts of the New Testament, written in the North of England dialect of the twelfth century; "The Owl and the Nightingale," their dispute about singing, beauty, and life, a poem of the same period as the first, the authorship of which has been attributed by Thomas Wright to Nicholas de Guildford; "Debate of the Body and Soul," accusing each other of misleading to sin, a poem of uncertain age; the "Song against the King of Almaigne." This last belongs to a series of political poems in Old-French, Old-English, and the Latin language, and is mockingly directed against the brother of Henry III., Richard, who had in 1257, by means of heavy bribery, been elected King of Germany, and had thereby entangled England in many complications. The song describes the battle of Lewes, in Sussex, fought on the 14th of May, 1264, in which Richard commanded a division, and in which the barons remained victors. Each stanza concludes with the couplet:

> "Richard, thah thou be ever trichard,
> Trichen shalt thou never more."

The word *trichard* (traitor) probably refers to Richard's having, on his return (1259) from Germany, solemnly sworn to the "Oxford provisions," agreed on between the King and the barons, and containing a confirmation and extension of the Magna Charta, and to the peace, both of which pledges he afterwards broke.

—Dr. August Boeckh died on the 3d ultimo, the birthday anniversary of Frederick William III., and as such the occasion of more than thirty-five brilliant orations from the now departed professor, as he spoke for his colleagues assembled to honor the memory of the founder of the university. On the ensuing Tuesday a long procession followed his remains to the churchyard of St. Dorothy. At its head walked a band of music; behind the hearse, drawn by four horses, followed his family on foot; then came the students in their gear carrying their veiled banners over a velvet cushion on which were laid the orders given him by many courts; next the Rector Magnificus, the representative of the ministry, the senators and deans of the faculties, deputations and friends; and the gala equipages of the King and Crown Prince led a long train of carriages. Boeckh's labors and works are known on both sides of the Atlantic as those of the most notable student of antiquity in our time; anecdotes of him have been, for many student generations, university legends throughout Germany, and both the lay and learned of his folk looked up to him as to their ideal of a German professor. Born in 1785, at Carlsruhe, he studied under the celebrated Frederick August Wolf, in Halle, and became professor in Heidelberg in 1807. At the foundation of the Berlin University, in 1810, he was called to the chair of "Ancient Literature and Eloquence," a position which he held until the celebration of that rare festival, the sixtieth anniversary of his doctorate, in March last. His fellow-townsmen, among whom he had honorably spent his youthful and maturer manhood and his riper age, presented him at his fifty years' doctor-jubilee the freedom of their city—an honor which Boeckh ever declared to be the highest of his distinctions, although he was stated secretary of the philosophical department of the Prussian Academy of Science, member of many societies at home and abroad, knight of high orders of all lands, and even chancellor of the civil order *pour le mérite*. Unlike many of his compeers, he never became so absorbed by his specialty as to exclude thoughts of another life with Kant's query, "Why should I trouble myself with what does not concern me?" but on fit occasions added his testimony to religion. In his oration at the jubilee of the university in 1860, a noble plea for freedom of thought, he said: "Science does not work against the kingdom of God; it rather builds thereon, and has in it its share and place. Yea, I venture to express the thought: Science with its twin sister, Art, is, as imitation of the ideals dwelling in God, a worship of God."

—A long-talked-of permission to receive graduating theses and make examinations in the vernacular has been accorded to the Prussian universities. This change will, of course, remove a great bugbear; it will also take away a great incentive to the study of Latin in the preparatory institutions, and may, on this account, be regretted. A new building is now required for the Berlin University library, as room cannot be found in the present one for the valuable and extensive collection bequeathed it by Professor Boeckh. Another new edifice will be a cathedral church, for which proposals are now invited by the minister of public instruction and religious affairs. Happily the specifications provide for carrying out an old idea of the late King for a *campo santo*, to be ornamented with pictures by Cornelius. The cost of this monument of King William's reign is not to exceed four million thalers ($2,880,000).

—Professor Gneist has lately published a stout pamphlet on "Die freie Advocatur" (Free Advocacy), which has attracted universal attention and much praise even from the government journals in Prussia. The critics seem to overlook, what the professor certainly did not, that every approval of his arguments is a blow at the judicial system of Prussia; for if every jurist had the option of becoming an advocate, none but the most stupid would be left to fill the almost unremunerated offices of judges.——Another instance of that great drawback on the German book trade, the tardiness of book critics, which leaves a book to become old before it becomes known, is the fact that Freiherr von Hock's work on American finance, reviewed in THE NATION last winter, has just reached an examination in a prominent quarterly devoted to finance and kindred topics. Due credit is accorded the author, one of that ingenious knot of gentlemen who have so long kept Austria from bankruptcy—a feat, by the way, which is not considered much longer possible. Large amounts in Austrian "securities" are held by old Prussian families, and have had quite an influence on the conservative politics; if they are repudiated, the Junkers will go furious. As is well known, the cautious Hollanders have been seduced by the high interest on the same

"securities" to an even greater extent.——A translation of an English pamphlet, "War of the Banks," is rather savagely handled in the journal just referred to. Almost every treatise on politics or finance published in England very speedily finds its way to Germany either as it appears or in German dress. This is due in no small part to the impetus given to English studies in Prussia by the marriage of the Crown Prince with the Princess Helen, and nearly all the younger journalists and literary men read English fluently. On the other hand, new American books very rarely reach Germany till after they have been duly quarantined in England; no one pretends to keep them on hand or to order them direct from the States, and the extra expenses incurred, or at least charged, on their route *via* London are formidable. It is the same with American periodicals, of which, excepting the New York *Weekly Tribune*, none are obtainable in Berlin.——A new edition of Rückert's poems, containing many never before in print, will be published in twelve volumes before the middle of next year. Geibel, whose earlier effusions, despite their elegant metre, have only found admirers among sentimental school-girls, has been prompted by an aggravated spell of weather to send a charming ode to the sun to the Cologne *Gazette*.——"Sonderlinge: Bragenzerwälder Lebens- und Charakterbilder aus der neuesten Zeit" (Peculiar People: Bragenz forest life and character-pictures of the latest time), by Franz Mich. Felder (2 vols., Hirzel, Leipzig), is a new novel written by an uneducated peasant. Professor Hillebrand, of Leipzig, discovered this uncut diamond and brought about the publication of a book of more than ordinary force and pith. If the sturdy air given by the homely phrases and expressions which in it take the place of elaborate word-painting and rounded periods could be preserved in a translation, it is worth rendering into English.

THE FUTURE OF BRAZIL.*

From the present year will date two of the most important steps yet taken by Brazil to consolidate its empire, menaced with dismemberment not only from its too bulky territory and its extent of untamed wilderness, but by narrow statecraft, its heterogeneous populations, and the institution of slavery. A few months ago the growth of slavery was definitively checked, and its abolition provided for within a period the half of which will not have passed when every slave will have disappeared. This very month inaugurates the free navigation of the waters of the Amazon and of the chief river of the southern coast by the ships of all nations. These centripetal measures are offset by the aggrandizing war on the River Plate.

What is Brazil? On the map, an area larger than that of the United States. In point of settlement, a strip of country averaging not a hundred miles in depth from the shore to the fastnesses of the interior. Within and beyond, along the great tributaries of the greatest of all American rivers, in the virgin forests from the coast serra and Pará to the base of the Andes, the savages hold undisputed and undisturbed possession. The gold-hunter, the Jesuit missionary, the kidnapper—Spanish and Portuguese—explorers of every nationality, solitary *savans* and naval expeditions, have traversed from time to time this still unknown region, but have left scarcely a trace of their passage. No roads are practicable through the interior, and the rivers have not yet been used as regular highways of communication with the capital and the seaboard. From Rio de Janeiro to the great inland district of Matto Grosso the official route was by the Paraná and the Paraguay, through the jurisdiction of a sovereign and now hostile state. Overland, Persia would not be more remote from Paris than are these two points from each other. The expedition to the rear directed by the Brazilians against Paraguay, on which the decision of the war is supposed to hang, has been more than a year, if we do not greatly err, in emerging from the jungle and approaching the scene of conflict. Should this prove abortive, Matto Grosso is a Brazilian province only in name—inaccessible for traffic, discipline, or for defence.

This explains why the empire is jealous of the republic, thrust like a wedge between its body and its members. But the provinces south of Rio de Janeiro belong, also, by their situation to the geography of the River Plate, and by climate to the temperate zone instead of to the tropics. In fact, they furnish the northern provinces, including the capital, with most of the cereals consumed there, and most of the beef. The planters who thus depend upon them devote their vast estates—a natural consequence of the system of slave-labor—to the more profitable products of the tropics, coffee, tea, sugar, etc., and import grain even from the Black Sea rather than grow it for themselves. This commercial connection with S. Paulo, Paraná, and Rio Grande do Sul would exist even if they were detached from the empire, and is not, therefore, in itself a bond of union. Hence the efforts made to colonize them from the north, and to build up a population strong enough and loyal enough some day to encroach upon and eventually occupy Uruguay, and thus to acquire for Brazil the natural and only secure boundary of the River Plate, and a principal share of its commerce. These motives were sufficient to precipitate the present war for the control of the southern river system, in conjunction with Buenos Ayres.

But other motives were not wanting. The same overgrown estates which will have nothing to do with feeding the people, and pay no taxes to the treasury, even when, as Mr. Fletcher tells of one, they cover eight square leagues, have from the beginning of the century stood in the way of European immigration, and have been the cause first of pitiful disasters to hundreds of German colonists, afterwards of diverting the stream to Uruguay, and latterly to the United States. Mr. Sturz, who is a man of his word, and who fought the land monopoly face to face for upwards of ten years without success, and trusted it would reform for sixteen more, during which he acted at Berlin as Consul-General of Brazil,—Mr. Sturz charges the empire distinctly with seeking, by encouraging sedition and rebellion in Uruguay, so to distract the country as to render it unfit for immigration, and with finally establishing the filibuster Flores as the autocrat of Montevideo, and his own faithful accomplice and servant.

We have thus analyzed the movement of Brazil towards the south, which is fast culminating, because neither Mr. Fletcher nor Mr. Codman, whose works we are more immediately considering, has undertaken to do so, and because, unless this movement is clearly understood, we have little insight into the future of that country. The problem now working out on the Plate is whether Brazil shall hold on the south the mouth and the sources of that river, on the north the mouth of the Amazon and the intervening coast; or, failing in the first particular, whether she will not eventually lose her southern provinces, perhaps in a confederation of which victorious Paraguay and rescued Uruguay shall be the extremes, with Entre Rios and Corrientes plucked not unwillingly from the side of the so-called Argentine Confederation. A defeat now is in all probability a final defeat, compelling Brazil to hold Matto Grosso, if at all, by the good pleasure of Paraguay, and to renounce for ever her contention for the sovereignty of the Plate. The adhesion of the southern provinces would then depend upon the ease with which troops could be transported to suppress a rebellion—a task which a steamer navy could probably accomplish for several years to come. But it would also depend on the character of the population at any given time, their numbers, and their relation to the people of the northern provinces. Mr. Codman invented the philanthropic plan of pouring Africa into Tropical Brazil, partly upon the theory that the climate is not to be endured by white men; but he has abandoned the project since the end of slavery is in sight. If, now, the land is made to contribute to the expenses of the Government, and if a land-office like that of the United States should be established and conducted as liberally, there is no reason why the province of Rio de Janeiro first of all should not be filled up from Europe, and be linked to Rio Grande do Sul by its foreign element even more powerfully than by its native. Meantime, by extending its railroads—it already has some of which it may boast for the physical obstacles surmounted and the thoroughness and boldness of their engineering—and by fostering colonies along the Amazon and its affluents, the empire would begin to resemble a well-fenced timber-lot, with convenient radiations to the heart of the wilderness, which it could subdue as strength and arms should multiply.

The people who are to preserve the national domain intact, if they can on these conditions, are fairly portrayed in the voluminous but readable work of Messrs. Fletcher and Kidder. Mr. Codman's experience, which, in point of space and time, was greatly inferior to theirs, is not valueless, however, as a corrective. Their weakness is that of missionaries who are bound to defend their chosen field; his is that of a man who detests, with Mr. Carlyle, the "nomadic service" of hired Africans, and who is touched with pity by a raw-backed mule that, converted into a well-flogged slave, would only receive from him an additional stripe. Mr. Codman, again, sees no future for Brazil. Mr. Fletcher not only sees a bright one very near—too near, we dare say—but actually proves that Brazil is advancing, not declining, in civilization. Almost every addition he has made to each successive edition of his book, notes some important improvement: the streets of Rio are lighted with gas, they are well paved, they are drained; he had known them when they were not.

* "Brazil and the Brazilians, portrayed in historical and descriptive sketches. By Rev. James C. Fletcher and Rev. D. P. Kidder, D.D." Illustrated. Sixth edition, revised and enlarged. Boston: Little, Brown & Co. 1866. 8vo, pp. viii., 640.

"Ten Months in Brazil, with incidents of voyages and travels, descriptions of scenery and character, notices of commerce and productions, etc. By John Codman." Boston: Lee & Shepard. 1867. 12mo, pp. 208.

"Les Dissensions des Républiques de la Plata et les Machinations du Brésil." Paris: E. Dentu. 1865. 8vo, pp. 87.

"Circular addressed to the Governors of all the States and Territories of the Union. By J. J. Sturz." New York, Nov. 11, 1866.

These are samples, only, but they palliate Mr. Fletcher's optimism. For the rest, he sees pretty much what other travellers have seen, what Mr. Codman himself saw, and (except in political matters) does not conceal or keep silent about the loose morals and utterly debased religion of the Brazilians. He is not so concise as Mr. Codman, and may bring some evils into less relief than the latter does—especially one very shocking instance of slave-breeding, which it must have pained Mr. Codman to relate without crediting it to an F. F. V.

In regard to the Emperor, Mr. Fletcher's testimony is highly flattering, but by no means unsupported. What can be done by the ruler of a very limited monarchy by way of example, Dom Pedro II. appears to do, and do creditably. He seems, also, to have a genuine regard for the United States, and to welcome our arts as he does our literature. There is evidently nothing small about his character, while there is much in it to admire. His attainments, both literary and scientific, are more than respectable, and his amiability cannot be doubted. He probably far transcends many of the state ceremonies which he feels constrained to celebrate according to custom, and he is at least not behind his people in religious toleration. That he has lent himself to the war with Paraguay any further than, as the chief of the executive, to declare it, and to take the field for a time in person, we do not learn. The reputation of Lopez as a tyrant towards his own countrymen and a bully towards neighboring powers, might deceive ambition into fancying itself virtue for trying to overthrow him; but we can hardly imagine Dom Pedro ignoring the vital connection between the independence of Uruguay and the prosperity, not to say existence and independence also, of Paraguay, or the fact that the apparent aggressiveness of the latter is in reality but self-defence, however barbarously (as is alleged) and illegally exercised. On the other hand, it is quite probable that the Emperor may console himself for the loss and scant honor of the struggle with a foe whose insignificance on the map is as much a misrepresentation as Brazil's importance, by reflecting that the war is hastening the decay of slavery (notably by manumission for military service), and will probably involve the taxation of landed property, to which no slaveholding class has ever willingly consented. In this sense the national debt would be "a national blessing."

Mr. Codman is very urgent that our misguided brethren of the South—or is that phrase too harsh for him?—should not obey their impulse to flee from Yankee despotism to the Brazilian paradise. His solicitude is at once just and humane; but nobody else but the Southerners themselves need be told that they are the last people to make the experiment of colonization in Brazil. All the rose color which is imputed by Mr. Codman to the Rev. Mr. Fletcher would not deceive the general reader on *that* score. The soil, the mill-inviting streams, the timber, the minerals, all resources and all spontaneous growths, contain fortunes for those only who are not afraid of hardships and of labor, and men, too, like the Pilgrims, whom "*small* things cannot discourage." The capacity of the country, its magnificent range of climate and productions—sometimes abruptly from the tropics to the temperate zones, on account of sudden elevation—its wonderful scenery, can hardly be exaggerated. For trustworthy details in this regard, as well as for more or less intimate descriptions of the chief cities from Rio to Pará, we refer to the narrative of Messrs. Fletcher and Kidder, believing that, with every allowance which the prudent reader may desire to make, there will remain a conviction of the vast field for Anglo-Saxon enterprise in all parts of the empire, and of the desirableness of a closer connection between it and this country. The commercial statistics will interest every merchant, while not a few tourists may be led to improve the new steamship line which has been subsidized by our Government, and test the comparative beauties of the bays of Rio and of Naples.

PROVERBS OF ALL NATIONS.*

Herr Wander and his fellow-philologists have really produced an international dictionary of proverbs, since to each German "Sprichwort" is appended in smaller type its synonyms in other languages, chiefly, however, the Dutch and English. These last and the German have invented proverbs apart from each other, but in the same spirit, and have been mutual borrowers. Some idea of the completeness and richness of this work may be formed from the circumstance of its containing, in its first of four volumes, not less than 44,937 German and 14,402 foreign proverbs, or together 59,339. Such a collection from printed sources and from verbal communications which, besides the comparison noted, preserves the origin of the principal proverbs by anecdotes of the incidents which gave rise to them, has never till now existed in the German or any other literature. In its scientific aspect, nearly equal in value to Grimm's German Dictionary, it is also an always fresh source of entertaining reading. The proverbs are grouped after their first principal word, be it a substantive, an adjective, or a verb, and the alphabetical arrangement of these words, of course, facilitates materially the finding of a proverb. The leading word, again, is placed at the head of each article in larger type, and then follow in alphabetical order and numbered the proverbs and the proverbial phrases, the latter of which are marked with an asterisk. The typographical arrangement of the work throughout is clear and neat, and the Latin type has been expressly selected for the purpose of making it better adapted to the use of foreign nations. The sources of the work are, whenever it appears necessary and is possible, given after each respective proverb by an abbreviated denomination, explained in the introduction. Where the same proverb has been expressed or written or printed in a different manner, each material version is given. This is the plan of Herr Wander's work, which treats not only of the proverbial literature of the High-German, Middle-High-German, and Old-German, but of nearly all other European languages, plus the classical. A brief analysis will best show how the author has understood his task.

Taking, for instance, the article "Bettler" (beggar), we find 159 German and 60 foreign proverbs, and selecting number 134 of this article, "Wenn der Bettler auf's Pferd kommt, so kann ihm kein Teufel mehr vorreiten," we have the following corresponding foreign proverbs: Eng.: "Set a beggar on horseback, he 'll ride to the devil" (Bohn II., 483). "There is no pride equal to the enriched beggar's" (Bohn II., 70). French: "Il n'est orgueil que de pauvre enrichi." Ital.: "Il villan nobilitado non conosce il parentado." Span.: "Mete mendigo en tu pajar, y hacersete ha heredero." Lat.: "Asperius nihil est humili, cum surgit in altum" (Claudianus). Under "Blut" (blood) we find 70 German and 28 foreign proverbs. We quote number 42 of this article: "Nur kalt' Blut, sagte der Koch zu den Krebsen, als er sie in die siedende Pfanne warf." This would be, literally, "Take it coolly, as the cook said to the crabs when he threw them into the frying-pan." Herr Wander's latitude admits this English proverb as a synonym: "Take it coolly, as the Jew said to the light sovereigns when he was sweating them." Under "Buch" (book) we find, number 17: "Es hat kein Buch so grosse Blätter als das Buch: 'S kann sein;" Eng.: "The book of may-bes is very broad." The articles "Frau" (wife), "Geld" (money), are the largest, having 770 and 1,420 numbers respectively. In the article "Geld" (money) we find, under number 765, the proverb: "Kein Geld, kein Schweizer;" French: "Point d'argent, point de suisse." The origin of this proverb is not modern, nor caused by the extravagant charges of Swiss hotel-keepers, as might be thought, but historical. When Francis I. of France, at the siege of Mailand by Charles V. in the year 1521, was unable to pay the Swiss soldiers, they went home with the words, "Kein Geld, kein Schweizer," which have since become proverbial; corresponding with it in general idea perhaps would be our proverb: "No money, no go."

The article "Brot" (bread) is a very large one, numbering 410 German and a great many foreign proverbs. Under the head "Existenz" we find Bismark's words, "Catilinarische Existenzen," with which he, in 1863, named the *littérateurs* and spokesmen of the Prussian Liberal party, and which, like his phrase, "Blut und Eisen," as a last remedy for the state, became proverbial. Under this article we find some other sayings of Prussian ministers: Manteuffel's, which he spoke, yielding, in 1852, at Olmütz to Austrian superiority, "Der Starke weicht muthig zurück" (The strong man courageously retreats); Von Rochow's, "Der Unterthanenverstand ist beschränkt" (The reason of subjects is limited); Count Schulenburg's, spoken at Berlin in 1806, when the French army was expected, after the battle of Jena, "Ruhe ist die erste Bürgerpflicht" (Quietness is the first duty of a citizen); Hansemann's, the founder of the Zollverein, and Prussian Minister of Finance, "In Geldsachen hört die Gemüthlichkeit auf" (In money matters good-heartedness is at an end); and the word of a Prussian prince, in 1849, who is now ruler of Prussia, "Gegen Demokraten helfen nur Soldaten" (Soldiers are the only remedy for democrats). All these words are now current proverbial sayings, used in an ironical sense in Germany. That the author has embodied these and a great many others bears testimony to the unfailing perseverance and industry with which he constantly draws from the current of contemporary public life, and thus infuses a zest rarely found in works of this character. His main source for English proverbs is Bohn's "Hand book of Proverbs, comprising an entire republication of Raye's Collection of English Proverbs (London, 1860)." The question whether a proverb belongs to this or that nation, with which it has originated and which received it by translation, appears to Herr Wander, with nations

* "Deutsches Sprichwörter-Lexikon. Ein Hausschatz für das deutsche Volk. Herausgegeben von Karl Fr. W. Wander." I. Band. A bis Gothen. Leipzig, 1867. New York: L. W. Schmidt.

which, like most of the European, have been in close relations, to be a difficult one. Like causes producing like results, the same thought may in different nations under similar circumstances spring into life as a proverb, when, naturally, the form which it assumes is of interest. The enquiry whether a proverb has come from the Germans to the English or *vice versa* will hardly lead to any certain result. In the first place, the national mind of each of the two peoples may have created it independently. But even if one of the two nations was the creative, the other the receptive one, how could that be discovered? It might be said, if the same proverb is to be found in English literature a century earlier than in the German, then the Germans received it from the English, or *vice versa*. But this conclusion is not to be trusted. The oldest book on which you can rely as evidence of priority may be suddenly displaced by an older book on the other side, which may almost always at least be supposed to exist. But then, too, the proverb may have lived in the mouth of the people supposed to have received it long before it appeared in any literature. Among every people there are thousands upon thousands of proverbs which have not yet been printed. And why should foreigners living with them not take them back to their native country, and print them there, whilst they are not yet printed at the place of their origin? Mr. Wander expresses his indifference to this question, and only in exceptional cases does he care whether a certain proverb is an original German one or whether it has immigrated, for, at any rate, more proverbs emigrate from Germany than immigrate. Real foreign proverbs will always betray themselves by their foreign stamp.

Of the proverbs of a nation, there are a great many known all over the country, which live in every mouth to-day just as they were spoken centuries ago. But by far the smallest part of the proverbial store of each nation belongs to this class. As there are men whose names are famous not only in their own land but far beyond it, and, on the other hand, men whose activity is limited to their province or county, and men who never went beyond the boundaries of their village, so with proverbs. But the proverbs known and used by a few only are still as much proverbs as those persons men. As there are men whose names go from people to people, from century to century, and others who, hardly born, die, so there are proverbs. The store of proverbs of a nation consists, then, of proverbs of a very different order as regards extension and time of use. It is hardly necessary to say that Mr. Wander's dictionary is a standard work, of value to every philologist as well as to all who are interested in German literature.

ANNE BRADSTREET'S WORKS.*

Among the passengers in the "Arbella," the admiral of the fleet in which Winthrop and the Massachusetts Company, bringing their charter, transferred the government of the country from Old to New England, were Thomas Dudley and Simon Bradstreet, the one in the ripeness of mature years, the other in the first years of manhood. At the last, or the last but one, of the General Courts held in England, while the fleet was detained at Southampton, the former was elected deputy governor in the place of Humfrey, who remained in England, and Bradstreet was chosen an assistant; both then commencing an active career of public service in the colony, both afterwards called repeatedly to fill the highest office in the infant commonwealth, and the latter, who has been aptly styled "the Nestor of New England," outliving the government as organized under the colonial charter, and even holding office under that granted by William and Mary, more than sixty years after. Two years before the embarkation of the company, Bradstreet had married Anne, the eldest daughter of Dudley, she being then sixteen years of age. In her "Religious Experiences," printed in this volume, she gives an account of the early impressions in regard to her spiritual condition, her restoration from the "pride and vanity" which had taken hold of her, and her final submission and trust in the Saviour. The habits of life and modes of thought prevalent in New England in her time were not congenial to the growth and development of poetic talent, nor was the literary education of women of her rank and station such as would be favorable to the acquisition of a high degree of mental culture. When, therefore, a volume of poems "by a Gentlewoman in New England" was published in London, in 1650, we can appreciate in some degree the feelings of the editor who gave it to the world, under the title of "The Tenth Muse lately sprung up in America." This first collection of her poems was published under the supervision of the Rev. John Woodbridge, who probably took the manuscript with him to England when he sailed for the old country in 1647. A second edition was issued in Boston by John Foster, in 1678, six years after the death of the author, containing her corrections, and, in addition, many poems found among her papers after her decease, and a third appeared anonymously in Boston in 1758, as "printed from the Second Edition."

We have now, in an attractive form, a complete collection of all the works of Mrs. Bradstreet in prose or verse which are known to be extant, including some posthumous writings which appear in print for the first time. Mr. Ellis has added a memoir of the author and her family, and a summary view of the state of English literature in the first quarter of the seventeenth century. The events which led to the emigration to New England, the circumstances attending the embarkation, and the incidents of the voyage, together with the leading occurrences of the first years of the Massachusetts Colony, in which both the father and husband of Mrs. Bradstreet held so prominent a position, are also narrated. The researches of the editor have also brought to view the various authorities upon whom she relied for the historical facts related in her poems. Her education we may suppose to have been eminently a religious one. The Bible, probably in the Genevan version, was her great text-book, and many of the grand and lofty subjects of Holy Writ are treated by her in verse or incidentally cited in her other works. Her more elaborate productions, "The Four Lessons," "The Four Monarchies," and her religious meditations, show on every page her familiarity with the Scriptures.

Her acquaintance with the ancient classical writers was probably limited to the English translations, or to extracts and citations by later authors, it being nearly certain that she was not familiar with the languages of Greece and Rome. The events treated of in her "Exact Epitomie of the Four Monarchies," which are not taken from the historical books of the Old Testament, appear to have been derived mostly from Raleigh's "History of the World," and Mr. Ellis presents us in the introduction with several parallel passages, showing how closely she has followed this author, not only in the narrative but in the language used by him. She appears also to have consulted Usher, Pemble, and other historical writers of the time in the course of her studies.

Mrs. Bradstreet's style, where it rises above the form of dry narration, partakes of the quaint imagery of the religious poets of her time, of whom Henry Vaughan and Francis Quarles are notable examples. Du Bartas, as translated by Joshua Sylvester, appears to have been one of her favorite authors.

Of the literary merit of Mrs. Bradstreet's poems, although we cannot fully agree with worthy President Rogers, who describes himself as "weltering in delight" after their perusal, we may say that there are not wanting descriptive passages, even in the narrative poems, in which her ideas are clothed in becoming and dignified language. Among these we may mention the verses entitled "Contemplations," which contain many excellent thoughts, simply but gracefully expressed.

The scenes and events of her daily life, especially those which were connected with the domestic affections, form no small part of the themes upon which she was wont to dwell. Many of her poems first published in the second edition are of this class. Letters to her husband in his absence from home, and touching and affectionate memorials of members of her family who had died in early age, mostly written in the last years of her life, are among these effusions, with verses suggested by such events as the access of a fit of sickness, the birth of a child, the departure of a near relative for a foreign country, or some other simple incident of her domestic life.

This collection of the writings of this amiable and able woman is a worthy and fitting contribution to the series of reprints of the works of early American authors, many of which have been recently issued.

PROFESSOR STOWE ON THE BOOKS OF THE BIBLE.*

Professor Stowe has presented in a popular form much valuable information concerning the origin and history of the New Testament Scriptures. He designs to publish hereafter another volume of a similar character upon the Old Testament. His style is homely and pithy, and his discussions are intelligible to readers of the average degree of intelligence. His third chapter, which treats of ancient manuscripts and of the mode of their transmission, is of special interest. The engraved specimens which accompany the text help to elucidate the subject. The colloquial tone of the author occasionally runs into a diverting extravagance of assertion or of metaphor. On p. 30, after protesting against a metaphysical interpretation of Scripture, he says: "Everything to its appropriate use. I would not take a broad-axe

* "The Works of Anne Bradstreet, in Prose and Verse. Edited by John Harvard Ellis." Charlestown: Abram E. Cutter. 1867.

* "Origin and History of the Books of the Bible, with the Canonical and the Apocryphal, designed to show what the Bible is not, what it is, and how to use it. By Prof. C. E. Stowe, D.D." Hartford, 1867.

to mend a pen with, nor a penknife to hew ship-timber with." There is no lack of emphasis in the announcement of his opinions. Speaking of the folly of confounding the canonical gospels with the apocryphal, he exclaims (p. 235): "With even more reason might you attribute the planning and rearing of such edifices as Westminster Abbey and St. Paul's Church and the new Parliament House to such characters as Mr. Pickwick and Mr. Jingle, the Artful Dodger and Fagin the Jew. There is reason in all things that are really things; and that which has no reason in it is nothing (an *Unding*), and neither deserves nor needs an answer." The author is evidently a lover of truth, and possessed of a fair stock of learning. His warmth sometimes leads him to leap to his conclusions, and to place what is at best problematical in the same category with what is established. For example, when he affirms (p. 165) that Matthew, having written his gospel in Hebrew, wrote it afterwards again in Greek, he makes an assertion which is not only without proof, but is destitute of plausibility. What evidence is there that Matthew made this translation, or this new composition? Prof. Stowe also assumes that the fact of a Hebrew original of the first gospel is unquestionable. He must be aware that so great a critic as Bleck, not to mention others, takes the opposite ground. In his polemical observations the author loses power by an exhibition of impatience, and by instituting in some places invective and ridicule for argument. After describing Renan's hypothesis respecting the life of Jesus, he begins his replication thus: "What is all this but the sheerest and most extravagant moonshine? What shadow or even pretence of a shadow of historical testimony or historical evidence of any kind does Renan give us? Not a particle of evidence of any kind, except the vagaries of his own brain, does he pretend to give." Of the various rationalistic hypotheses, he remarks (p. 306): "Their hypotheses have absolutely nothing to stand upon. They are made wholly out of air and fog, and the moment the sun shines on them they are gone." This rhetoric is not of the kind denominated by Aristotle and other masters "the conciliatory." It is not adapted to win the attention and respect of doubters who may have been captivated by the ingenious but unsound theories which Professor Stowe sets himself to combat. But, apart from certain blemishes, some of which we have indicated, the work is a meritorious one, and is likely to prove useful to a great number of persons who crave information on the topics discussed in it.

Argument for Opening the Reading-Room of the Boston Public Library on Sunday Afternoons. By Charles M. Ellis. (Boston: A. Williams & Co.)—We are glad this argument has been printed, all the more because, through no deficiency of its own, it failed of its immediate object. That object, as we have before expressed our belief, is postponed merely, not defeated, and meantime this pamphlet will work for it potently, and stimulate a renewal of the petition with an improved public sentiment behind it. It is our constant hope, too, that public libraries will be multiplied in every part of every State, and as the Sunday question is pretty sure to arise in a majority of instances—especially till the great cities have set the liberal example—this pamphlet has more than a local value, and should be widely circulated. In time, we are sure, not only will the people of Massachusetts appreciate the wise doctrine of their constitution, that "the encouragement of arts and sciences, and all good literature, tends to the honor of God, the advantage of the Christian religion, and the great benefit of this and the other United States," but it will come to be adopted also by the country at large. It appears that three times as many books are taken out of the Boston Public Library on Saturday as on any other day—of course that they may furnish reading for Sunday—but we do not hear that this is deplored, or that any one pretends nowadays to prohibit so-called secular reading on Sunday, or proposes any remedy for the Saturday evasion. On the other hand, all Sunday-school libraries distribute and recall their volumes on Sunday. Mr. Ellis rightly insists that the question is not one of days, but that, "if the use of the reading-room is for the spiritual good of man, it is good for the Sabbath and for this day [Sunday];" and as for the demand that the open library must be shown to be a "necessity," "shall we," he asks, "save a few cocks of hay, and waste the stores of knowledge, the spiritual good?"

The modesty of the Boston petition—for the opening of the reading-room only, with its newspapers, periodicals, and valuable books of reference, involving perhaps the services of a single attendant, and competing with the churches in that part of Sunday when their congregations are smallest and most insignificant in relation to the great body of the people—a petition for access to religious journals as well as to scientific and popular, supported by the librarian of the Public Library and of the Boston Athenæum—such moderation, we venture to say, is less likely to be exhibited another year because it has been repulsed in this. And we suppose Mr. Ellis would admit that his argument covers the circulating library as well as that portion which, from its nature, can not be taken from the building, but which all the more needs to be accessible on the chief and only leisure day of thousands of industrious citizens.

The Sayings of Dr. Bushwhacker and other Learned Men. By Frederick S. Cozzens, author of "Sparrowgrass Papers," etc., *et al.* (New York: A. Simpson & Co. 1867.)—The articles, essays, papers, pieces, or whatever may be the proper name for the materials of which this book is made up, are chiefly by Mr. Cozzens, while a few are from other hands. He says, in his preface, "The papers included in this volume are partly from *The Wine Press*, a monthly periodical which I edited for seven years—until the breaking out of the civil war—with some new articles, and with various essays of the author, that have heretofore been printed on the sands of fugitive magazines and newspapers. Some of these shells and pebbles I have reclaimed; the rest lie upon the beach unnoticed, and happily unknown."

Dr. Bushwhacker is a gentleman who delivers opinions in an authoritative manner on all sorts of subjects—tea, tapioca-pudding, the relation of literature to liquor, and many others—to an admiring audience who supply him at the right moments with questions calculated to stimulate his flow of ideas. The result is a considerable amount of information and opinion, given in a hasty, bustling way, which now and then amuses, but oftener fatigues. In fact, to sum the whole matter up in a few words, we should say that the chief difficulty with Dr. Bushwhacker, and the whole Bushwhacker family (and a very large and prolific family it is too, chiefly engaged in what may be called the paper-business), is that, notwithstanding their desperately good intentions, and their voluminous achievements, they do not succeed in their main desire, they do not attain their central object; they are not—the little word must be said—they are not—funny.

Altogether the best thing in the book is an imitation of Macaulay's style by Colonel Porter of the Eighth New York Artillery, who died at Cold Harbor leading a charge at the head of his regiment during the late war. He has been better known heretofore through his patriotism than through his talent for writing; but to those who read this charming *jeu d'esprit*, published for the first time by Mr. Cozzens, his ability as a writer will make itself quite as apparent as had already his devotion to his country. This short extract, from a supposed volume of Macaulay's in which his history has been brought down to a period within the memory of men still living, comprises accounts of the characters of Washington and Franklin. Of the former "stoic savages told with wonder how he alone was calm when the soldiers of Braddock were slaughtered like sheep; and Continental veterans love to narrate how his face shone with heroic fire as he rallied the broken battalions at Monmouth." And the description of Franklin is capital too: "A Quaker diplomatist was about to appear in the most artificial of courts; a new Archimedes was to come from the land of the Natchez and the Mohawk: the legate of the latest republic was to recall the image of antique wisdom and of antique virtue—of the Grecian Solon and the Roman Regulus. Haughty courtiers bent in emotion before him: brilliant beauties struggled for a kiss," etc. etc. It is pleasing, in these days of far-fetched parodies and wild burlesques, to come upon an imitation at once so amusing and so close. It is difficult to see why even Macaulay himself should find fault with the copy.

The Principles and Practice of Disinfection. By Robert Barthelow, A.M., M.D., Professor of Materia Medica and Therapeutics in the Medical College of Ohio. (Cincinnati: R. W. Carroll & Co. 1867.)—In this little book we have a clear and explicit account of the principles and practice of disinfection, which it would be well if every householder in the land could be made to read and act upon. The language is simple and the doctrines enunciated are fully up to the present state of chemical and hygienic science. Dr. Barthelow does not unduly exalt disinfection. All means of purifying the air are, as he admits, nothing compared to ventilation—that is, the removal of the vitiated atmosphere and its replacement with that which is fresh and uncontaminated. Unfortunately we cannot always effect good ventilation, and then the noxious matters in the air must be as far as possible destroyed. If mankind could be made to act up to the principles of health as established by the science of hygiene, there would be no need for disinfectants of any kind. The best evidence we have ever had of the natural depravity of man is his inborn contempt for cleanliness; and, perhaps, not till the advent of the millennium may we hope for a radical change in his disposition.

With the view, however, of aiding in this desirable transformation, we recommend Dr. Barthelow's admirable little volume to all who wish to make life more tolerable than it is at present.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

THE DEMOCRATS AND THE PUBLIC DEBT.

As might have been expected, the public debt is likely to form the most prominent topic of discussion in preparation for the State elections of this fall, perhaps even more prominent than the dispute between the President and Congress. The importance of this dispute depends entirely on the bearing it is likely to have on the work of reconstruction, and the work of reconstruction on the Congressional plan is more likely to be frustrated by a determined assault on the public credit than in any other way. In selecting the public credit, too, as the object of their attacks, the Democratic leaders are displaying that intimate acquaintance with the worst side of human nature by which for years past their greatest triumphs have been won. The character of a people is, in fact, much more severely tested by the pecuniary cost of a war than by the war itself. During the progress of hostilities there are plenty of sources besides mere love of principle from which men draw the courage never to submit or yield. There is pride, hatred, animal pugnacity, interest in the dread game itself, all of which have often operated to protract a war for years after its original cause or objects had been forgotten, and after all principle or semblance of principle had died out of it. But when the last shot has been fired, the banners have been folded, the dead buried, the books balanced, and men have to settle down to the dull routine of their old life, and toil not only to repair their shattered fortunes, but to pay off money borrowed to help them to secure objects which have been already secured or lost beyond doubt—money, too, which, like most money borrowed in seasons of doubt and danger, has perhaps been borrowed on very unfavorable terms, and which has doubtless been spent wildly, recklessly, and extravagantly, as money is apt to be in time of war—then, and only then, comes the real trial of their honor and patriotism. Almost any male animal will fight, but it is only the *élite* of the human race which, when the fighting is over, will sit down in the calm of peace and doggedly and industriously *pay*. Demagogues know this, of course, perfectly well, and count on it, so that, whether they have in the first instance advocated the war or not, they are pretty sure, when it is over, to advise people to repudiate.

The leaders of the Democratic party have, perhaps, stronger reasons for urging repudiation than any other demagogues have ever had. In the first place, they violently opposed the war, and predicted steadily and persistently that the money borrowed for it would never be refunded. Therefore they have the ordinary human interest in bringing about the fulfilment of their own prophecies. In the second place, they look on the public debt as a great instrument of national consolidation, and to consolidation they are violently opposed; and if they should succeed in breaking down the national credit at this juncture, they feel satisfied that the United States would never again be able to borrow on any great scale or for any great enterprise—certainly never to resist a new attempt at secession. Moreover, they are the friends of only one "section," and that is the South. To them New England is nothing and New York is nothing and the West is nothing; but for the South as a unit they have a real tenderness. Now, the South will probably feel the burden of the debt more than any other part of the country. To her it is not simply a debt, it is a penalty, and a very humiliating penalty—a moral as well as a physical burden. It is at once the sign and memorial of her defeat. To get rid of the debt is, therefore, the highest service the Democrats can render the South, and, perhaps, the only way they can hope to win back the Southern whites into the old alliance.

Of course they do not now propose downright repudiation. They are much too shrewd to be guilty of such brutal frankness as this. They know perfectly well that the memories of the war are still strong and still sacred, and though they opposed it bitterly and mourned over every Union victory, and though the sight of the uniform is odious to them, they like to get a Union soldier for their candidate whenever they can, and affect to consider their participation in the struggle a title to popular confidence. Occasionally at a nominating convention, as the other day in Ohio, a drunken or indiscreet member blurts out the real feeling of the party about the Northern army, but he is instantly checked, and one of his colleagues "sits on his head," as on a fallen horse, till his kicking and plunging can do no harm. So, also, with regard to the public debt, they approach it cautiously and with the tenderest regard for what they consider the popular weakness. They have accordingly opened the campaign by a determined attack on the interest of it, while for the principal they profess the profoundest respect. This idea of assailing the public credit as an instrument of party warfare was undoubtedly conceived long ago. The first public expression of it was made in Mr. Johnson's conversation with Miles O'Reilly, in which he denounced the public creditors as a "bond aristocracy," and declared the design of the Radicals was to administer the Government for their benefit. But in Mr. Johnson's hands it has not, as might have been expected, been used with as much dexterity as in Mr. Pendleton's. The theory on which the "bond aristocracy" was held up for popular execration was that the United States bonds were mainly held by very wealthy men, and that the Government was passing more and more into the hands of its creditors and used to serve their purposes. Mr. Pendleton knows, of course, that this is absurd, or what is, perhaps, more to the purpose, knows that nobody will believe it; so, instead of maintaining that the debt is kept up for the benefit of a few bloated capitalists, he simply says that for the debt he has the deepest respect; all that he objects to is the interest. He says that the holders of the bonds did not pay for them in specie but in greenbacks, and this at a time when greenbacks were worth very much less than they are now; therefore, what can be more fair than to pay them off in greenbacks? In this way they will get what they gave. The greenbacks required to settle their claims will only cost a few hours' labor at the printing-press, and the people will be relieved of the burden of the interest.

The answer to this proposal is, of course, obvious. The price which every holder of United States bonds paid for them was what they were worth at the time. Investing in "Governments" during the war was a speculation which it required, both on the part of the native and foreigner, considerable faith to make. At the time when most of the United States bonds were issued some of the ablest financiers in the world were strongly of opinion that they would never be paid. The fortunes of war were still doubtful. Even the most ardent supporters of it could say little more, in 1863 and 1864, than that they would never give up—that, come sooner or come later, victory would be for the North, though what it would cost in men and money to achieve it nobody could tell. Moreover, the low rate in specie at which bonds could be bought was one of the arguments most strongly urged in recommending them to investors. To turn round now and use it as an argument for not paying them in specie would be very like fining a man for his simplicity in being taken in by a cheat. Every nation which has never had its credit severely tested, and which is engaged in a war waged not for conquest or a disputed succession, but to decide whether it is a nation or not, must expect to borrow money at a disadvantage, and borrowing at a disadvantage means getting very little and undertaking to pay a great deal.

If we now undertook to pay off these bonds in greenbacks, the minute the proposition was made public greenbacks would lose nearly all their value; first, because the very issue of them would be a sign that the United States promises to pay were worthless. Nobody in his senses would give anything for the promissory notes of a government which had repudiated its bonds, particularly when these very notes were issued as the means of repudiation; secondly, because the number of greenbacks would be so greatly increased that, even if their payment is certain, their value in relation to gold would fall to about one-half its present figure. It is not probable, in fact, that after the Democratic plan of getting rid of the interest had been adopted, greenbacks would bring five cents on the dollar. There would be a general return to specie payments; but it would be through one of the greatest swindles on record. Except for the fun and excitement of the "financiering," simple and undisguised repudiation would be much preferable, as it would certainly be more simple and manly, and would cer-

tainly make a less unfavorable impression on mankind as to the condition of American morals.

The argument which Mr. Pendleton and his *confrères* bring forward, and which is producing, and probably will produce, more effect than any, is the weight with which the interest of the debt presses on the mass of the people. But this is not a question which, with a people making any pretensions to morality, is worth a moment's consideration. The repayment of borrowed money is almost always a painful and inconvenient process; but this has never been held to be a good reason for not repaying it. Everybody knew the burden of the public debt would be heavy when the loans were raised, and whether they were well or ill spent is something with which the lenders have nothing to do; the national faith being pledged to them that they will be repaid in coin and in any event, not if we find it convenient, or if the West is satisfied or the East is satisfied, or if the poor are satisfied, but under all circumstances and at any hazard. It is pledged too against all forced conversions or wrigglings or twistings or turnings which will make the debt any less valuable to bondholders than it was agreed that it should be when it was contracted. If we should fail to pay as we promised to pay, the creditors have, it is true, no remedy. There is no tribunal before which a nation can be cited; but no nation has ever yet repudiated without finding before very long what a terrible thing the loss of credit is, for nations which repudiate are almost always governed by knaves, and so badly governed that they can never very long keep out of scrapes which make loans necessary.

We confess, however, that except as an illustration of the way in which demagogues seek to use human baseness for their own selfish ends, we do not consider the Democratic crusade against the public debt very formidable. The "bond aristocracy" is happily a figment of Mr. Johnson's excited though not very cultivated imagination. The vast majority of the holders of the national bonds are poor men and women who are glad to commit their hardly-won savings to the national keeping, and where they do not hold them directly the savings-banks hold them by the million, so that the public credit has plenty of support in the interest as well as in the honor of the people.

It would be hard to overestimate the importance of the course of the majority on a question of this sort. If democracy is going to excel monarchies and aristocracies in nothing but in being stronger, better fed, and richer, everybody who believes that the mission of nations as of men is not to breed fast and get fat, but to "incline to God's will and walk in his way," will be glad to see the last of it. If this democracy were deliberately to embrace the principles preached by what is called the Democratic party in this country, history would talk of it as the worst curse that ever befel mankind. From the vices of kings and nobles there was an appeal to popular virtue, but from the vices of democracy there is no appeal but to despotism. It is, of course, of the highest importance that we should all get rich as fast as we can; but in getting rich we should never forget that the state is something "better than a partnership agreement in a trade of pepper and of coffee, calico or tobacco, or some other such low concern, to be taken up for a little temporary interest, and to be dissolved by the fancy of the parties. It is to be looked on with other reverence, because it is not a partnership in things subservient only to the gross animal existence of a temporary and perishable nature. It is a partnership in all arts, a partnership in every virtue and in all perfection."

COMPULSORY EDUCATION.

It appears that the Committee on Education at the Constitutional Convention now sitting at Albany are not about to recommend that education be made compulsory in the State. We regret this determination, for not only does the successful operation of our democratic republican political system depend upon the general education of the community, but it is through universal education alone that the system can be protected against the worst perils that menace its efficiency and its permanence. It is probable that two considerations have mainly influenced the committee in their conclusions. First, that the State does not yet provide sufficient means for the education of all its members, and that until this is done it would be impracticable to make education compulsory; and, second, that the mass of the community is not sufficiently enlightened to recognize the full importance of universal education, and consequently not prepared to give to an enactment making education compulsory that moral support which is requisite for the efficiency of any law whatsoever. For the power of law in a community like ours depends primarily not on the penalties it denounces for its violation, nor on the number and fidelity of the agents employed in enforcing it, but on its correspondence with the general sense and sentiment of the community as to its necessity and justice.

The point, then, to be aimed at in the discussion of the subject for the present is the quickening of the sense of the community as to its importance, so as to bring the people to the conviction that universal education is the indispensable foundation and safeguard of a system of universal suffrage. Where every man is a voter, and where every woman is soon to become one, every man and every woman is supposed, in theory at least, to possess that amount of intelligence which is requisite for the exercise of the elective franchise without risk to the safety of the State. Political power without intelligence means simply mischief; it is the power to do harm.

Now education, indeed, does not create or even absolutely secure intelligence. Its object is to promote the development of intelligence, to afford a stimulus to its growth, and to provide the individual with the necessary means for that self-culture by which native capacities are increased. Education thus prepares the way for the franchise; it creates a substantial claim for its exercise, a claim far more effective in politics, far more real in justice, than any that rests upon a fancied natural right.

It would seem hardly to require argument to show that where universal suffrage prevails, there should exist universal education. Education short of universal will not answer, for a few ignorant men can do harm that not ten times their number of intelligent voters can prevent or can repair. The present condition of the government and the judiciary of the city of New York is as striking an illustration as could be afforded of the inefficiency of a system of education, excellent as far as it goes, but falling short of universality, to protect the community of honest and instructed men from the evils wrought by a band of ignorant and, in a great measure in consequence of their ignorance, unprincipled men.

But, say the advocates of our present system as opposed to a compulsory system, nobody denies the advantage of education, or the importance of its being universal; supply the means of universal education, but leave every individual free to make use of the means for himself or his children according to the dictates of reason and interest; you have no right to diminish his sense of responsibility or to limit his personal freedom, by compelling him to make use of opportunities or advantages against his will; you destroy the fundamental principle of our political system—the independence and liberty of the individual.

Such talk as this is a specimen of the loose and fallacious thought which is far too common among us. The *absolute* independence and liberty of the individual is not the fundamental principle of our political system, but only the *relative* independence and liberty. Society and government are organized, laws are enacted, simply to maintain the relative independence and liberty. The absolute freedom of every individual is constantly limited by the strong arm of the law, representing not only the general interest of the community of which he forms a part, but his own final particular interest. It is the interest of the community no less than of the individual that he should be as free as possible—that is, as free as is consistent with the greatest possible amount of general freedom. Now, the general freedom is impaired, and consequently in the long run the freedom of each individual diminished, by the prevalence of ignorance. The ignorance of a single person lessens to the extent of that person's power the freedom of the community. It is forced to provide safeguards against the evils of which his ignorance may be the source. In every crowded community there is a large class of children who, if not educated, become thieves, paupers, and, if possessed of political powers, dangerous to the state, but who, if educated, become productive and helpful members of the general body of the people.

Compulsory education, then, far from being, as it may seem at first sight, a limitation of individual freedom, is, on the contrary, its pro-

tection. The state is only the concrete expression of the mass of the individuals who compose it, and its interest is never really in opposition to theirs. It is the interest of the state to have every individual educated; it is the interest of every individual to be so. But in many instances he will not be sufficiently enlightened as to his interest to secure education for himself or his children, and it becomes the first duty of the state to compel him to secure that education without which he is likely to be hurtful to himself no less than to the community.

Universal compulsory education is at first costly, but it is, in the long run, the truest economy. It not only gives to the individual the command of his faculties, which enables him to become a producer of values, but it saves him from becoming a burden on the state or a plunderer of the community. An increase in expense for schools leads to a decrease of expenses for courts, police, prisons, jails, and workhouses. In Switzerland, as we learn from a late authority, "a reformed system of education has almost emptied the jails. In July, 1863, there was not a soul in the prison of the Canton de Vaud; at Neufchâtel there were two prisoners. In the Grand-Duchy of Baden, where great efforts were made in 1834 for the improvement of education, the number of prisoners fell in eight years (1854–1861) from 1,426 to 691, the number of thefts from 1,009 became 460, pauperism decreased by one-fourth, and jails had to be closed." There is no need to multiply instances of this sort. They may be found in abundance on every hand. The fact is established and admitted that education in proportion to its extent and thoroughness is an economy to a state.

Laws exist in several of the United States imposing penalties for truancy or unnecessary absence from school, but no State of the Union has yet adopted an effective compulsory system. New York is not behind her sisters in this respect. But, with the practical establishment of the rule of universal suffrage, the necessity of universal education becomes more plain, and it can hardly be long before the most enlightened States will be led to an efficient compulsory system. Unless such a system be adopted there can be no certainty of the continuance of our prosperity or our freedom.

It is a mistake to suppose that such a system would be, if properly devised, irksome to the people, or that it would have to be enforced against the will of the larger and better part of them. The Rev. Mark Pattison, one of her Majesty's Assistant Commissioners of Education, speaking of the system as it exists in Prussia, says:

> "Compulsory school attendance dates from the earliest period of the Reformation, and was a recognized religious duty long before it became a law of the state. The schooling is compulsory only in name; the school has taken so deep a root in the social habit of the German people that, were the law repealed to-morrow, no one doubts that the schools would continue as full as they now are."

So it would be in America. Let the state provide ample means for the education of every child within its borders, and then let it compel parents to make use of these means for their children.

EUROPEAN PROSPECTS.

The fears of a European war, which have again begun to prevail, and which the Emperor Napoleon's pacific speeches are hardly sufficient to dissipate, are exercising once more such a powerful influence on trade and finance that it may be worth while to consider what amount of foundation they have. That the French Government is anxious to fight, both for the purpose of checking the aggrandizement of Prussia and of wiping out the remembrance of the Mexican expedition, and of the mortifying check it experienced in the Luxembourg affair, may as well be taken for granted in all discussion on this subject. On this point there is little or no room for doubt. But when the minute speculators conclude that it will do what it would like to do, will rush into the field against Prussia as readily as Mr. Banks or Fernando Wood propose to bestow belligerent rights on the Fenians, they become an easy prey to every newsmonger who chooses to concoct a sensational story. The rapid arming of the French troops with the Chassepôt rifle does not, as we have over and over asserted, indicate any intention on the part of the Emperor to engage in immediate hostilities. It is a natural and obvious precaution against a terrible and disastrous surprise. After the exhibition afforded in the Sadowa campaign of the advantages of the needle-gun, he would be mad to leave the French army unprovided with a similar weapon one minute longer than is necessary, let his intentions be ever so pacific. He might not choose to fight Prussia, but Prussia might at any time choose to fight him, and it is not true of nations, as it is of individuals, that "it takes two to make a quarrel." It is not likely that the French army will, however, be fully provided with the new weapon before next spring, so that even if the Emperor were so impatient as to contemplate a winter campaign, common prudence would dictate his waiting till next May; and that he intends to wait may be inferred from the pains which he, the *Moniteur*, and the Marquis de Moustier are taking to spread pacific assurances.

It is tolerably certain, however, that he will not risk a war with such an antagonist as Prussia without an ally. Prussia would undoubtedly be able to bring a million of men into the field for a struggle with France, and although General Changarnier has laid it down recently that an army of 500,000 is as much as any power need care to have or can well manage, it is nevertheless true that two armies of 500,000 each would be apt, if well handled, to make mince-meat of one of the same size. Even Hanover, the most hostile and discontented of recent Prussian annexations, would against Frenchmen be faithful to the core. The South German states, too, are rapidly fulfilling the engagements they have entered into with Prussia. Baden has already provided herself with 24,000 needle-guns and two million cartridges; Würtemberg with 30,000 needle-guns and one million and a half of cartridges; and Bavaria is working with equal zeal; so it is expected that by next spring these three powers will be able to place at the disposal of Prussia 120,000 men, armed, equipped, drilled, and organized on the Prussian model. There is nothing in this complicated affair, perhaps, so certain as that Germany expects war in the spring. The testimony on this point is overwhelming. Germans are confident that Louis Napoleon means to fight, and as soon as possible, and no pacific speeches or circulars will cause them to change their opinion. Therefore German preparations are likely to be prosecuted through the winter with great ardor. But it is equally certain that the Germans do not want war. One of the results of the Prussian military system, and one which, perhaps, its projectors did not foresee, is, that experience of war, instead of exciting military ardor amongst the population, diminishes it. Under the military system of all other European states soldiering is the trade of a distinct class, and the soldier's only hope of a rise in life lies in frequent and prolonged wars. Therefore it has become almost an axiom with European publicists that a sovereign who has once achieved success in the field cannot long remain at peace; that he will be forced by his troops to find employment for them. Reasoning on this theory, most writers in England, even those who were most friendly, expected that the close of our war with the South would be followed by an attack on Canada—that a million of men, flushed with conquest, could never be got to disperse quietly to their homes.

In the Prussian army, however, the professional soldiers, properly so called, in time of war form a small minority. The mass of the men are bound to civil life by the closest ties, and the evils of war, instead of being felt only by a class which has made war its trade, are felt in every home, shop, and counting-house in the land. So that greatly as Prussian pride has been exalted by the Seven Weeks' Campaign, we venture to assert that there is at this moment far less military enthusiasm than there was before Sadowa. As a matter of fact, there is very much less boasting heard from Prussians since Sadowa than there was after the pitiful exploit of Düppel against the Danes. At Düppel, victory was achieved with little or no loss, and it was the first affair in which Prussian troops under the new system had been engaged, except in the little campaign against the Baden insurgents in 1849, and it naturally greatly excited their imaginations as to what they could accomplish if they could meet a first-class power in the open field. The campaign against Austria, brilliant as it was, was attended with enormous loss. The new levies, in spite of their good qualities under fire and their admirable patience, succumbed readily under fatigue and exposure, as new levies must always do; the commissariat arrangements were, in many respects, defective, and the hospital arrangements were positively bad. The result is that the German people, both victors and vanquished,

will now very willingly repose on their laurels. France, if there be a war, will almost certainly be the aggressor.

But France will hardly attack without a certainty of success. A war with Prussia would not be, in any sense of the word, a national war. It would not be waged in defence of the national territory or in vengeance for an insult; it would, in short, have no better or higher object than to prove Louis Napoleon's fitness to occupy the French throne—so that success would be for him an absolute necessity; defeat would be ruin. The passage of the French frontier by a victorious Prussian army would almost certainly be the signal for the overthrow of the Bonaparte dynasty. Therefore we may be sure we shall not witness a commencement of hostilities on the part of France, unless her chances are at least equal. They can only be made equal by an ally, and the only possible ally is Austria. England is incapable of a Continental war, Italy is on the verge of bankruptcy, and France is evidently, from her course with regard to the Papal legion, in no humor to conciliate her; Spain is in the throes of an insurrection, and Russia is gone soul and body into Pansclavism, and cares nothing for anybody who cannot help her to get Constantinople.

What is Austria worth as an ally against Prussia? Nothing, or next to nothing. If we take from the Austrian revenue at this moment the expense of the army and navy on a peace footing, and the interest on the public debt, there remains for the court, the civil administration, and all other expenses, $5,000,000! Another great war is for a power thus situated simply impossible. The calmest and shrewdest observers of the condition of Austria declare that at least ten years of peace and reform are necessary to give the empire even a chance of life. Hungary is still in a troubled condition, and the ministry is on the point of resigning, while the Sclavonic population of the empire is also lately honeycombed by Russian propagandism. The Bohemians, Croats, and Serbs are all wild with the idea of a great Pansclavic confederation. Deputations from the Sclaves of Servia, as well as of Hungary and Bohemia, visited St. Petersburg in May, and were received with great cordiality, and during their stay nothing was heard of in speeches and newspapers but Sclavonic unity. A Russian journal, the *Swiet*, has been established in Hungary, devoted entirely to the interests of the Sclavonic, or, as it pleases to call them, Russian population; another organ of the same party is published in Russian at Prague, and another, called *The Aurora*, at Vienna. With Hungary independent and by no means enamored of the Hapsburg family, and with the Sclaves absorbed in the idea of the political reunion of their scattered race, Austria's only reliance in war would be the original German duchy, and this against Germans, even if its forces were worth mention, would hardly be depended on.

Under these circumstances it is difficult to believe that the Salzburg conference has increased the chance of hostilities. We venture to predict that it will be found to have dissipated all thought of them, as far as Louis Napoleon is concerned. He found Francis Joseph a very different man from the hot youth whom he met at Villafranca. The disasters of the last ten years have not befallen the Austrian Emperor for nothing. The unfortunate man is now perhaps for the first time aware that he is the last of the feudal sovereigns, that the prosperity of his house depended on the preservation of the order of things which raised it to greatness, and that the invincible forces of modern society are all arrayed against him.

HINTS FOR CONSTITUTION-MAKERS.

BY A JUDGE.

IV.—The Executive.

In this country the chief evils that attend the executive are, 1st, The abuse of the appointing power; and, 2d, The inefficiency of the public service. The former is most powerful in the General Government; the latter in the government of New York. Whoever has had any extended business intercourse with the two must have observed how much more capable are the officials, and how much more efficient is the system, of the United States. It may be laid down as a rule that the General Government is served more cheaply for the service it exacts, and receives better service for the wages it pays, than any other employer with whom it competes. There is, undoubtedly, some secret corruption and the slackness of execution that is inseparable from the service of all governments, yet the machinery goes round year after year with incredibly few flaws appearing and scarcely ever with a breakage occurring.

He who has gone behind the scenes at Washington knows that the labor, care, and responsibility rest upon comparatively few men. There will be found two classes of officials—the one composed of worthless trash too weak for the tests of ordinary employers, which has been forced by members of Congress upon the secretaries, and by the secretaries upon their protesting subordinates; the other of elderly, sober, industrious business men, who meddle not at all with politics, and care little for Congress and its members' influence. These are the men who do the work. They hold office perennially, and grow gray and remain beggars in the service of the Government. The Government keeps them in office because it cannot do without them; but it neither pays them adequately, nor promotes them justly, nor holds out any hope or promise. These are the employees that I refer to when I say that the General Government is more cheaply served than any other employer; and they conclusively prove that when a competent man can be assured of remaining in office, he prefers the Government to any other employer.

Political patronage is the curse of the civil service, and may prove the curse of the republic. It was the power of the South; the infection with which slavery corrupted the political parties of the North. When a man's political opinions are the tenure of his office, and his office gives him his livelihood, there is a fearful strain upon his conscience and integrity. Moreover, there is in the service of the General Government and the several States an immense army of persons dependent for support on these various governments. They are not producers and render nothing toward the common stock. But behind them is a much larger throng, some of whom have been turned out of office and some of whom have been disappointed in "getting in." These men are for the most part idlers, subtracted from the general industry of the people. We cannot at this time afford to lose so many hands; for their loss is so much subtracted from the national wealth and certainly from the national energy.

The vile doctrine that the public service is political plunder, under the specious cry that to the victor belong the spoils, began with Jackson, and continued unquestioned till it was checked by Lincoln. It is assumed that this political patronage is a great political power, which helps parties to control elections, and helps incumbents to control conventions. And this is true. Yet our political history presents the remarkable fact, that while the President is the officer most likely and most able to profit by the public service and use it for his individual benefit, he has always been its victim. The great and significant fact seems to have been unseen by our public men, that between Jackson and Lincoln only one President has been renominated, and not one has been re-elected.

Americans are a practical people, yet full of theories and strangely unobservant of facts. While Europeans have gone forward, we have gone backward (so as to be not far from the ministry of Walpole), and are fifty years behind England in the matter of the civil service. The most statesmanlike measure of reform that has been presented for twenty years was the bill of Mr. Jenckes at the previous session of Congress. Yet it was defeated because a few semi-civilized members thought that an efficient and economical civil service would do well enough for the aristocracy of Europe, but was not adapted to our free institutions.

In the State of New York the governor is but a part of the executive. His powers are chiefly negative—to veto bills, to pardon criminals, and the like. He cannot remove the secretary of state, nor control a single officer of state, though he may appoint temporarily in cases of vacancy, and may turn his executive-chamber into a court-room, and, when charges are preferred against a district attorney or sheriff, take legal evidence and determine the matter in a judicial way. I presume that in the last twenty years not one public officer has been removed by the governor for carelessness, ignorance, imbecility, or general neglect of duty, and those who have been reached for specific acts are very few. The Prison Association has shown that the district attorneys of this State have alarmingly neglected to prosecute bail bonds. If any citizen chooses to prefer a charge against any district attorney to the effect that he has corruptly and improperly refrained from prosecuting the forfeited recognizance of A. B., and will then proceed to prove the charge, and shall succeed in making out a sufficient case, it is probable that the governor will remove the delinquent officer. But what governor has ever dreamed of saying to a district attorney, "Sir, the laws are not faithfully administered in your county, the constitution makes it my duty to see that they are, and if your part of the work is not better performed you will be removed"? The greatest of statesmen would be weak in such an office, and when it comes to the selection and election of a governor, the people know that there is little good to come out of the office, and that when the veto and the pardoning powers are past, it makes little difference who is governor. The only governor whose hand New York has felt through the period of her present constitution was Edwin D. Morgan; and he showed himself strong by the firm and fearless exercise of these two powers.

The facts which our twofold experience discloses are these:

1. The executive should have the smallest possible gift of patronage

—the power to appoint a few chief officers who are intended to co-operate immediately with him, and the power to fill vacancies, and nothing more.

2. He should have almost unrestricted power of removal for cause, and to secure the efficient and faithful administration of the laws, care being taken that his removals are for those objects, and a solemn declaration being required that they are made for those objects only.

3. The tenure of administrative offices should be for good behavior; and no man should be appointed to office until his fitness has passed the test of examination, and the appointing power should be vested in those officers who will be immediately and directly responsible for the work of their subordinates.

THOMAS CARLYLE.

We publish elsewhere a communication from a gentleman whose position in the world of letters fairly entitles him to criticise language used in public discussion, even when, as in the present case, he does it somewhat sharply, taking exception to the terms in which we last week spoke of Mr. Carlyle and his latest diatribe against democracy. As we have never admitted that any of the great lights of our time were never mistaken, we have no right, even if we had the desire, to claim infallibility for ourselves either as to the form or substance of what we say, and it may be that on grounds of taste there are objections to speaking of Mr. Carlyle and his deliverances in the terms in which we have spoken of them. But then we deny that it is to be taken for granted, as Mr. Kirk seems to do, that strong language is always unwarrantable; and we propose to offer some reasons, to be taken by the reader for what they are worth, for believing that we have not in this instance fallen into a sin which we have so often taken the liberty of condemning in others.

Mr. Kirk has evidently very much misunderstood the issue between The Nation and Horace Greeley on the subject of "calling names" in discussion. Mr. Greeley has, we believe, always claimed, and has, to our knowledge, in numerous instances exercised, the right of treating dissent from his opinions on political and legal questions as moral offences. We remember a case in which he denounced a correspondent as a "scoundrel" for simply construing a section of the Constitution, in very mild and temperate language, differently from himself. Nothing has been more common with him than to call men "liars" for simply giving a different version of an occurrence from that which Mr. Greeley believed to be the correct one, or for imputing motives or aims to the Republican party which he, on its behalf, felt bound to repudiate. Now, no man can "lie" or be a "scoundrel" without knowing that he "lies" or that his conduct has been base; and to conclude, because a man differs from you on a point of law or takes a view of public affairs or of the character of public men different from your own, he is knowingly guilty of an attempt to deceive, or, in other words, of an immoral act, is, in the first place, absurd. If this rule were applied to himself, Horace Greeley would certainly be pronounced by a majority of the people of the United States the greatest "liar" in America, for nobody has differed in opinion from a greater number of people. In the next place, it is mischievous, inasmuch as it confuses people's notions of right and wrong, and, by familiarizing them with the imputation of falsehood and baseness to men whom they know to be upright and honorable, causes them to attach no importance whatever to newspaper denunciations of real "liars" and "scoundrels." In the third place, it is slanderous and misleading, lowers the public respect for private character, and, though last not least, it corrupts and barbarizes the popular taste. For all these reasons we have not hesitated to denounce Mr. Greeley's method whenever the opportunity presented itself. Mr. Kirk's assumption or insinuation that we consider the concurrence or approval of the majority of our readers a justification for the use of language on other grounds unjustifiable, we must simply repudiate. If we were in the habit of taking the supposed tastes or opinions of the majority of our subscribers as a guide either in the choice of our language or opinions, The Nation would certainly be a much more popular journal than it is.

Now, we have not called Mr. Carlyle either a "liar" or a "scoundrel." We have not deduced from his opinions any conclusions whatever as to his moral condition, though, if we were to treat him on Mr. Greeley's plan, it would not be by any means difficult to do so. What we have done is to deduce from his published writings certain conclusions as to his mental condition. We have called him "foolish" and "conceited," both of which epithets describe states of mind; and we feel bound to add that we consider them, under all the circumstances, mild epithets. We might have called his opinions absurd—perhaps Mr. Kirk would have found no fault with it; but then "absurd" is a term more commonly applied to opinions which are reached by a process of reasoning of some kind. Of late, Mr. Carlyle has not deigned to support his opinions by any arguments whatever. He simply flings them at our heads and bids us swallow them, donkeys that we are. A person who does this in our day is a "foolish" person. We know of no other way of describing him. That Mr. Carlyle is "conceited" we infer from the style in which he disposes of the greatest social problems of our time. He scorns to treat them even gravely or deliberately, or to argue upon them, and yet he evidently considers it necessary that the world should hear from him about them all, and not as an enquirer, nor yet as a man who, while holding his own convictions strongly and warmly, is yet conscious that there are other thinkers in the world besides himself who are, at least, worth the trouble of confuting. If ever a writer displayed "conceit," Mr. Carlyle displayed it most offensively in his famous "Ilias in Nuce," to which he treated the world during the late war. If he had been an inspired prophet, decency would have forbidden his disposing of so tremendous a question as that which, in this wretched *jeu d'esprit*, he solved to his own satisfaction with such contemptuous levity.

But, it may be asked, are we not bound, in consideration of Mr. Carlyle's past services to humanity and free thought, to treat him, even in the midst of what we consider his later aberrations, with deference or respect? We think not; because we believe that he is now using the influence he acquired in his earlier and better days to propagate opinions and justify practices which we consider to be immoral and barbarizing, and the triumph of which would, in our opinion, be fatal to everything which makes this world worth living in. That he has still great influence we infer from the respect with which what we are forced by the very constitution of our mind, whether correctly or incorrectly, to call his rant is received, the extent to which it is quoted and wept over by his worshippers, and the readiness of men like Mr. Kirk to rush into the field in his defence or justification. Mr. Carlyle has for many years back acted as the apostle of brute force. He has employed all the weight of authority which he acquired by such compositions as "Sartor Resartus" and "Past and Present" in defence of the absolute subjection of everybody and everything to the strong hand. He has labored with all his resources to convert the civilized world to the belief that the exercise of power furnishes its own justification, that the sole duty of weakness is to submit, and that the only true civilizers and elevators of mankind are the sword and the whip, and that anybody who maintains that the helpless have rights is a knave or a fool. Nobody can have watched the course of opinion in England and America during the last ten years without seeing that he has been instrumental in converting large numbers of influential men into what we cannot help calling enemies of the human race. He furnished the pro-slavery school of philosophers at the South with most of the ammunition with which they for years bombarded "free society"—with the arguments by which they sought to show that slavery is the divinely ordained condition of the laborer. Nor were his disciples confined to the South. They swarm at this moment in the choicest circles of Philadelphia, New York, and Boston.

In England his influence has been still more marked and malefic. He helped not only to extinguish the generous enthusiasm for human rights which crowned the labors of Clarkson and Wilberforce with rejoicing, but to supply the new commercial school, which holds that the chief end of men is to furnish profits for capital, with a philosophical disguise for their unscrupulous greed. The results of his work were fully revealed when the war broke out here. We say deliberately that, for the almost devilish outburst of sympathy with the Confederacy which was witnessed in the middle and upper classes in England during the first years of the war—sympathy which no crimes or atrocities and no avowals of iniquitous intentions seemed sufficient to check—Mr. Carlyle more than any one man is responsible. The success of the North silenced and cowed that party as far as this country is concerned. But it did not loosen a single article in their creed. How well grounded they are in their prophet's doctrines was shown after the disturbances in Jamaica. When Governor Eyre came home red-handed from slaughter and outrage which a Roman proconsul would have blushed to own, which shocked and amazed all that is most Christian and most intelligent in English society, Thomas Carlyle's voice was one of the first to welcome, console, and justify him. Hardly a man sat down at the shameful feast given him at Southampton who would not and did not defend him in Mr. Carlyle's language.

We honestly confess that, right or wrong, we believe it would have been better for the world and for himself if Mr. Carlyle never had written a line, than that he should write as he is writing now. We flatter ourselves that, as there was much noble thinking done before he was born, there would have been enough noble thinking to carry humanity on to its goal if Mr. Carlyle had never appeared. Providence has not left the race dependent on any one teacher; and Providence could hardly have furnished a better illus-

tration of the danger of pinning our faith on any teacher, however wise or illustrious, than by permitting Thomas Carlyle to become in his old age the apostle of violence, the despiser and reviler of those whom God has left dependent for their happiness and security on the justice and humanity of their more richly gifted fellows. When Socrates and Plato made their appearance at Athens, they found the Greek mind firmly wedded to the belief that injustice was an evil only to the victims of injustice, that to the workers of injustice it was no evil at all. The first and noblest triumph of the new philosophy, that which brought it nearest to Christianity, was the uprooting of this error. After twenty-five hundred years, however, we find the doctrine revived and amplified in England, and are actually called upon in America to reverence the man who has resuscitated it and is glorifying it. Mr. Carlyle holds that both the tyrant and his victim are the better of tyranny.

We do not know what the fate of democracy will be here or elsewhere. If it does not succeed in supplying better government than the world has got from Mr. Carlyle's heroes, during the last fifteen hundred years, we sincerely hope it may perish utterly. We care very little for forms of government. The end of all government is the perfection of the individual man, and it is because we see in democracy with all its shortcomings and corruptions a far better promise of human development than the Charleses, Napoleons, or the Fredericks or the Rob Roys or the Eyres have ever held out, that we are willing to labor and wait for its success. In the meantime we have the consolation of knowing that the world can hardly be worse governed in the future than it has been in the past.

Correspondence.

CURRENCY CONTRACTION.

To the Editor of The Nation:

An interesting article on the contraction of the currency, in the last number of The Nation, raises a question whether we have been correct in attributing the inflation of prices and other "financial irregularities" to the existence of an excessive amount of paper money, and whether we should be certain to reach what we desire by the proposed diminution in the volume of what is commonly termed currency.

There are some who believe as Mr. Webster did, when he said in one of his speeches that "the currency consists of all those things with which we effect our commercial transactions," and that, practically, legal tenders and bank-notes make but a small portion of the whole mass of paper and credits which are used as the title to, and representatives of, the merchandise which we are engaged in exchanging.

Cashiers' checks, and all others, as well as drafts and bills of exchange, appear to be currency as much as bank-notes, performing the same offices and being subject to the same laws of trade. It is true that we have attempted by legislation to invest the bank-note with a character different from the check or draft of the cashier. But this difference is rather apparent than real, more in form than substance—one having neither more nor less purchasing or paying power than the other.

It is not by any means clear that our banks could not withdraw all their notes from circulation, sell the Government bonds upon which they are issued, and then use checks for small or large convenient sums as substitutes, precisely as, in spite of the Comptroller's opposition at first, they have had to do already.

It does not appear that Congress or any other power could prevent this, nor that the change could materially affect prices, or bring us any nearer resumption, though we should thus have reduced the volume of what is called currency three hundred millions of dollars.

There is really good reason to consider, as a certain not very large class of writers do, that the currency, taken in its broadest sense, is simply an effect, and not a cause primarily, depending for its volume in some form upon the amount and price of the commodities or merchandise which it is called upon to represent, and not upon legislation. Following out this idea, it is assumed that we are not to expect resumption and a return to lower prices and more stable financial conditions by means of contraction, but that our first step is to decide that all contracts for the payment of money hereafter shall be made by the specie standard, and that all which now exist, payable in currency, shall, when due, be paid in specie funds at such premium as rules at the date of resumption, so that the debtor and creditor shall sustain the same relative position as before, and neither be wronged nor inconvenienced by the change.

It is claimed that this would be simply just to all parties, and entirely satisfy the Western people, who are, from the nature of things, debtors to the East, and thus opposed to any measures which will diminish the price of their commodities, while their liabilities remain as before.

Capitalists here and abroad may naturally desire to enhance the value of their claims upon us, as they would, practically, by resumption and the consequent reduction in prices; but this we cannot afford, and therefore, while we should not attempt to change the terms of any of our obligations, old or new, payable in specie, we have the right to insist that all our currency debts shall be paid at what they are really worth in specie, and not at their nominal amount.

Neither Mr. Pendleton, Mr. Train, nor any other Democrat or demagogue can claim more than this, and it is not easy for an impartial observer to see how the debtors can claim less. They are willing to put the price of all their commodities down to specie prices, and they ask that the price of their liabilities, which are to be paid by sale of these commodities, shall be reduced simultaneously and in the same proportion.

This does not change the real value or purchasing power in either case, but it does enable us to dispose of a certain portion of our inflated prices and currency at the same time, and in a mode which can harm no one who has a proper amount of means to meet his obligations. No one will be called upon to pay specie, for it is not that the creditor wants so long as we offer him other products of labor at specie prices, such as he must pay if we gave him corn instead of paper. All he wants is paper, or currency, which is the title to and representative of merchandise or other property. Let him be assured of this, and he will refuse specie, because if he has that he must lose interest until he exchanges it for something useful, while his paper, if he so desires, will be constantly growing more valuable by the accruing interest which the debtor pays. Let us, then, not fear to return to the specie standard, and thus reduce our prices and the volume of our currency to more reasonable proportions, and at the same time relieve our credit from the stain which has been cast upon it by our continued suspension.

There are those who believe that suspension was not necessary, and they know that, if it was, it was not just to violate the existing contracts by permitting the debtors to cancel their obligations at half price, or less.

Now the case is reversed, and we claim that it would be equally unjust in principle not to guard against the violation of existing contracts payable in our present inflated currency which would result from an immediate return to the specie standard without some provision for the protection of the numerous debtor class, who will sooner or later make themselves heard and felt, unless they are treated justly.

Justice is all we ask for them, and it is all that they can claim. This Congress has the power to ensure in less than a month after the commencement of the next session, and we shall be disappointed if the movements of our Democratic politicians in the West do not convince our members that something must be done soon. D. W.

Boston, August 26, 1867.

[The plan proposed by "D. W." would in practice be tantamount to repudiation. To declare that on and after a certain date all contracts should be made payable in coin, would be to declare that after that date greenbacks should cease to be a legal tender for all but existing debts. There would then be a prodigious fall in their value, or, as it is more commonly called, a rise in gold. Debtors would pursue their creditors with paper money, and creditors would run away from them. Nobody would take the paper money who could possibly avoid it, and at last, perhaps very soon, it would go out of use, to the ruin or immense loss of all holders of it at the time the law passed. This would certainly be a return to specie payments, but it would also be a swindle; and better greenbacks and honesty than gold and knavery. There is only one honorable and perfectly safe way of returning to specie payments, and that is by enabling the Government either to redeem its promises to pay in coin, or by inspiring general confidence that it will pay them in coin when called upon. One of the most curious chapters in the history of money is the story of the devices by which "financiers" have sought to enable the Government to evade its obligations without doing anybody any harm; but like Mr. Micawber's ingenious mode of discharging his liabilities, however satisfactory to the inventors, none of these devices have answered their purpose. If "D. W." means that the West does not want to pay its debts, let him say so; but do not let us befog ourselves with the notion that if paper which is now a legal tender were to cease to be a legal tender on and

after a certain date, and no provision were in the meantime made for its redemption, nobody would be cheated, and no injury would be done to the public credit.—Ed. Nation.]

CARLYLE.

To the Editor of The Nation:

Sir: May I be permitted to ask whether the language, "foolish and conceited old man," applied to Mr. Carlyle in yesterday's Nation, conforms with the standard of taste set up by your journal in distinction from most others, and generally—as it is a pleasure to acknowledge—adhered to by its writers?

In treating Carlyle's denunciations of democracy as pure "rigmarole," you of course express the opinion of the great majority of your readers; and Mr. Greeley has, no doubt, the same excuse when he calls his opponents "liars." But even among ardent believers in democratic progress there must be some who owe to the author of "Past and Present" and of "Sartor Resartus" no small portion of that intellectual stimulant which has enabled them to exercise the liberty of thinking for themselves—of all kinds of liberty the most precious and the most secure, though the least valued and the least practised. Such persons, however they may differ from him in opinion, can hardly be pleased at seeing a man whom they have learned to revere described in terms which could not be used without impropriety in any theoretical discussion. I have not had an opportunity of reading the paper on which you have commented. Its author's views are familiar to me; and I have sometimes taken the freedom—more readily accorded by men of his temperament than by many of a suaver utterance—to combat them in conversation. That was, however, several years ago. Since then a constant perusal of The Nation—of its frequent and elaborate exposures of the corruptions with which our political system is encrusted—has done much to induce a conviction that unless democracy, as established in America, undergoes some early and great modification, it must end where all demoralized systems have hitherto ended—in convulsion and overthrow.

With much respect, your obedient servant,

J. F. Kirk.

451 Broome Street, New York.

Valuable School-Books,

PUBLISHED BY

IVISON, PHINNEY, BLAKEMAN & CO.,

47 and 49 Greene Street, N. Y.

No series of School-Books ever offered to the public have attained so wide a circulation, or received the approval and endorsement of so many competent and reliable educators, in all parts of the United States, as this.

Among the most prominent of their publications are the following, viz.:

SANDERS'S UNION READERS AND SPELLERS,
ROBINSON'S SERIES OF MATHEMATICS,
KERL'S GRAMMARS,
WELLS'S NATURAL SCIENCES,
SPENCERIAN SYSTEM OF PENMANSHIP,
WILLSON'S HISTORIES,
BRYANT & STRATTON'S BOOK-KEEPING,
FASQUELLE S FRENCH SERIES,
WOODBURY'S GERMAN SERIES,
MANTILLA'S SPANISH READERS,
COLTON'S GEOGRAPHIES,
WEBSTER'S SCHOOL DICTIONARIES,
BRADBURY'S SCHOOL MUSIC BOOKS,
Etc., Etc.

They also manufacture the SPENCERIAN STEEL PENS, which are regarded by the best penmen in the country as superior to all others.

☞ Teachers, and all others interested, are invited to send for our Descriptive Catalogue and Circular, and to correspond with us freely.

This Day Published:

FULL COLORED EDITION OF THE

BIRDS OF NEW ENGLAND

AND ADJACENT STATES.

BY E. A. SAMUELS,

Curator of Zoölogy in Massachusetts State Cabinet.

THE WORK WILL CONTAIN

Twenty-three full-page Plates of Birds,

ACCURATELY COLORED FROM NATURE;

FOUR FULL-PAGE PLATES OF EGGS

(colored),

and a large number of smaller figures on wood.

One elegant volume, 8vo, price $15.

Plain edition of same work, $6; and edition with Eggs alone (colored), $7.

ALSO,

ECCE CŒLUM;

Or, PARISH ASTRONOMY.

BY A CONNECTICUT PASTOR.

1 vol. 16mo, price $1 25.

This work contains: I. Preparatory—Uses of Astronomy, History, and Instruments of Investigation. II. The Sky, Aspect, Nature, and Contents. III. Satellite Systems—Example, Earth and Moon. IV. Planet Systems—Example, Solar System. V. Higher Systems—Suns, Groups, Clusters, etc. VI. Author of Nature, as related to its Leading Features.

The Week.

THE political campaign of this fall has not opened favorably for the Republicans. An important State, which was transformed by the loyalty of its citizens from a pro-slavery stronghold into one of the most decidedly Republican States in the Union, has been lost to the party. A Republican majority of 15,000—equal, considering the difference in population, to a majority of 100,000 in New York—has been swallowed up. A governor, a legislature, a United States senator, and one or two members of the lower house have all been lost. Such a loss would be at any time a grave disaster, but at the present moment there are peculiar reasons for regretting it, as the President will doubtless be encouraged by it. In order to understand it we must go back a little in the history of California politics. Every one knows that San Francisco, in the first few years after it came into American hands, was the paradise of scoundrels. Ballot box stuffing was carried on more scientifically there than anywhere else, the police were the worst ruffians in the city, and government in general was what it would be in New York to-day if it had been left entirely in the hands to which many wise men in the Constitutional Convention propose to restore it. The Vigilance Committee, by illegal means, rescued the city from the hands of the thieves and murderers who administered the mockery which they called law, and re-established law and order. They hanged one or two of the worst scoundrels, banished a few more, and laid the basis of good government, which ever since then the city has enjoyed. But, though the public elections were reformed, the political machinery was not. Primary elections relapsed, after a few years, into the hands of the many minor scoundrels who were *not* banished. While the Republican party was in a feeble minority it was not troubled with the company of these fellows. But when, in the patriotic fervor of 1861, the Republicans carried the State, and it became clear that they would retain power, many of the blacklegs came over to the party, and almost all of them, whatever party they might vote with at regular elections, volunteered their invaluable services at the Republican "primaries." The consequence has been that for the last four years the Republican political machinery in San Francisco and some other large towns has been entirely in the hands of unprincipled men bent upon public plunder. In 1863 the present governor of the State secured his nomination by a bargain with these men. During the present year a combination was formed by the friends of Senator Conness, whose own antecedents are of very dubious purity, with those of Mr. George C. Gorham, a noted lobbyist, who had for some years been seeking to carry a scheme through the Legislature highly profitable to a private clique, but fearfully expensive to the people of San Francisco. The allies carried the primary elections in that and other cities by the usual well-understood means. Mr. Gorham was nominated for governor, and a ticket for the Legislature was presented pledged to the support of Mr. Conness for another senatorial term. The result is before us. Gorham and Conness are both defeated. San Francisco, which gave 4,315 majority for Lincoln, gives 3,848 against Gorham; Sacramento, which gave Lincoln five votes for every two that McClellan received, goes strongly Democratic. The whole State is lost, possibly—for such is often the result of such events—for years.

Mr. Johnson has at last produced his long expected amnesty proclamation. As the Reconstruction act specially provides that Presidential pardon or amnesty shall not qualify persons now under the ban to vote, the proclamation would possess little political importance if it were not a political manifesto, and were not filled with inuendoes directed against Congress, and did not, in fact, indicate pretty clearly Mr. Johnson's intention to carry on the war. He reiterates in it broadly the doctrine that whatever conditions he thought proper to impose on the South are legal; but no others. This last step seems to render his impeachment more certain. He has evidently passed under new management, and is displaying more vigor and coherence than he has done yet. Gold is, in the meantime, creeping steadily up; and what with the complication at Washington, the Democratic victory in California, and the weakness exhibited by one or two prominent Republicans on the subject of the public debt, the political sky is cloudier than it has been for many months. Congress has formally withdrawn from the President all the authority it has given or can give to the President to grant pardon or amnesty to persons not convicted of any offence, so that he now relies wholly on judicial interpretations of his powers under the Constitution. In President Lincoln's proclamation the authorization of Congress was formally referred to in the preamble and declared to be in accordance with judicial construction.

California has been lost through Republican corruption; Maine, on the other hand, has been won by a considerably diminished majority, and the same story will probably have to be told of all the other States whose elections are to take place this fall. The reason is, that the issues are mostly local and not very exciting. Prohibition, for instance, was the point in dispute at the Maine election. The elections, therefore, really possess little or no interest or significance as regards Federal politics; but the result thus far is likely to prove mischievous by confirming Mr. Johnson in his delusions.

As might have been expected, those who advocated impeachment a year ago are now, when everybody is admitting its necessity, crowing with triumph, as if this showed they were very wise men. Others, again, fancy that those who once opposed it and now advocate it, thereby confess that they are deficient in foresight and discrimination. The great danger of impeachment, however, lies, as we have often said, in the tendency of the stronger party to use it as a weapon of party warfare. Admit once that a President may be impeached simply because Congress does not like his administration, or, in fact, impeached at all, except in the last extremity, and you alter the whole character of the Government, and make impeachment a regular party measure whenever

the majority in Congress changes during the presidential term. Therefore, those who opposed impeachment last year were right; because there was then every reason to believe that there would be no occasion for it. There is now every reason to believe that there is no other mode of completing the work of reconstruction, and this being plain, impeachment will not be, as it would otherwise have been, a dangerous precedent. Those who are crying out, "We told you so," if they mean by this that we ought to confess they were right last year, are simply making an exhibition of their own obtuseness. If the President was to be impeached not when he had done something to merit impeachment, but when some politician or clique of politicians made up their minds that he would do something to merit it at some future time, we should have an impeachment process going on constantly. We may feel ever so satisfied from what we see of his character that a certain dissolute man will yet commit a murder; but what would be thought of a criminal code under which he was liable to be hanged by anticipation whenever a knot of his neighbors came to the conclusion that he was sure to be guilty of a crime? The state of mental confusion into which some Congressmen and Senators have got themselves about the *duty* of impeachment is really pitiable. Mr. Sumner evidently thinks he settles the whole matter by telling people "to read Story and Bishop;" but then there is a great deal besides reading necessary to form a sound judgment on any subject.

Somebody took the trouble last week to pay visits to Senators Wilson and Sumner and to General Butler, ply them with questions touching their opinions on the political crisis, and take down their answers in shorthand. The result was not in any way remarkable except in General Butler's case, who produced some financial theories which, though they date from the invention of "bad debts," are somewhat novel in their application to national liabilities. Hitherto, when nations have repudiated it has usually been because they did not like taxation; but General Butler recommends repudiation, amongst others, on the ground that the loan was not made out of love. We have commented elsewhere on this extraordinary mixture of absurdity and "smartness." Mr. Sumner spoke very good-humoredly both of friends and enemies, even of Mr. Fessenden rather in sorrow than anger. "The new recruits" in the Senate, as he calls them, he regards with pity, not unmixed with wonder, owing to their difference from himself on the subject of impeachment during the session; but of some of them—Conkling, for instance—he still has hopes. His account of Mr. Fessenden was highly picturesque, and, everything considered, very good-natured. There is, however, "nothing of the jurist," he says, in Mr. Fessenden's "nature or attainments;" "he comes into debate as the Missouri enters the Mississippi, and discolors it with temper filled and surcharged with sediment." We are sorry to hear, however, that Mr. Fessenden has not "the volume of the great river." It appears that Mr. Phillips calls Mr. Fessenden "a dyspeptic Scotch terrier," which we cannot help pronouncing an unseemly attack of the pot upon the kettle, if we may vary the simile. In Mr. Wilson's remarks there was nothing with which the public is not already familiar, except his opinion that the feeling of the country had undergone a great change on the subject of impeachment within a few weeks.

The Committee of the New York Constitutional Convention has brought in its report on the government of the city, which it proposes to make independent of the Legislature for twenty years—that is, until the next convention—giving the mayor greatly increased power, making the aldermen a body of twelve, but elective by the city at large, thus offering some guarantee that they would be a *corps d'élite*. The councilmen are, however, still to come from the wards, and the police justices to be elected by "the people"—that is, by the criminal population, for no other portion of the community takes any interest in these offices. The report is clearly a compromise between the desirable and the attainable, and the attainable has got the best of the bargain. We venture to predict that, if this scheme should be adopted and the city Democracy be fairly liberated from all fear of interference on the part of the Legislature, we shall witness a state of things the like of which has not been produced in any city of modern times, and that by the meeting of the next convention there will be few men of property left in the municipality to tell the tale. The Legislature has certainly not been successful in reforming the city government, but it has imposed checks on rascality of which we shall not know the value until they are removed. The idea that an omnipotent mayor will save us is, we think, a pure delusion. The mayor may be, and in three cases out of five will be, in spite of the "respectable classes," any rascal who is willing to pay Tammany or Mozart Hall enough for the nomination. He will, too, during his term of office, endure the bombardment of the press with unruffled brow, and appear in the Central Park every afternoon with one of the finest pairs of horses in the country, and bless the convention every time he hears his champagne pop.

The "American Industrial League," the organization founded by the protectionists as an offset to the "Free Trade League," has issued an address to the public, greatly defaced by vituperation of its opponents, to whom it attributes the basest motives, but in which it states its main object moderately and fairly enough. It advocates the taxation of foreign luxuries, and the imposition on all foreign goods of a duty at least equal in amount to the "difference in price paid for their labor to the workmen of Europe and the workmen of the United States." It is right to mention that the price paid for labor, if only expressed in money, may be made an instrument of great delusion. Wages are to be estimated solely by their purchasing power, and, therefore, such tables of wages in Europe as Colonel Forney is sending home are utterly worthless, unless accompanied by a table of the prices of the commodities which working-men buy.

The Iron Age, which we hoped was about to introduce something like decency into the protectionist and free-trade discussion, quotes an article from *The Irish Republic*, of Chicago, showing that free-trade is a British invention, and so on, and then charging the free-trade journals of the Republican party with having been bribed by the British with advertising. This *The Iron Age* calls "a vigorous passage," and goes on to insinuate that Mr. Simon Stern bought up the Chicago *Tribune* on a recent visit to Chicago, and wants to know whether ten thousand dollars were or were not paid on that occasion by somebody to somebody. There is about as much sense—we say nothing of decency—in concluding that free-trade can only be advocated by a bribed man as that a protectionist writer must be in the pay of native manufacturers. The question whether free-trade or protection is the best policy is a scientific question, and the introduction of brutal personalities into the discussion of it, though more natural, is not more likely to lead to a satisfactory solution of it, than an attempt to decide on the merits of Agassiz's glacial theory by an examination of his biography. *Apropos* of this, we see the Academy of Sciences denounced by a Western paper as a "Copperhead organization." Is it quite certain that the Darwinian hypothesis was not concocted in the interest of the slaveholders' rebellion?

During the absence of "H. G." in the Constitutional Convention "T. W." turned his attention to Colonel Hillyer, formerly of General Grant's staff and now a revenue collector in this city, and wrote to the general, calling attention rather regretfully to the colonel's alleged moral defects. Grant sent the colonel the letter, and the latter thereupon turned his pen on "T. W.," and the result appeared in *The Commercial Advertiser* of last week, and was as choice a bit of newspaper fisticuffs as we remember to have seen for a long time, and deserves to be read as one of the best specimens of an art that is rapidly passing away. At the close, Colonel Hillyer glories in "T. W.'s" hate, and "T. W." dismisses Hillyer in a formula which now seems to be almost universally used in such cases, by an allusion to his excessive consumption of whiskey. We doubt if there has been a newspaper quarrel since the outbreak of the war in which one or other of the combatants has not had his love of the bottle, or, as it is more poetically but less correctly called in temperance tracts, the "poisonous bowl," exposed for the execration of the sober public.

That there is an insurrection in Spain everybody knows, but how much of an insurrection nobody out of Spain seems to know. The newspaper accounts of it are ridiculous. Martial law has been pro-

claimed in various districts, and the troops are in daily collision with the insurgents, and proclamations are hurled to and fro with the greatest energy; but all else is mystery. The Spanish newspapers report everything in what may be called the "Latin" manner, so that it is impossible to form an idea of how much truth there is in what they say. This manner was originated by the French *Moniteur*, and has spread amongst the Latin races with great rapidity, so that in all the Latin countries newspapers abuse their enemies, or report what they do not like, in exactly the same tone. They do not think of ridiculing or calling them names, as the American or English or German press is apt to do; but treat them from a lofty moral platform, and in the language of an indignant clergyman.

The doubts which we ventured to express last week as to the probability of the meeting at Salzburg having any immediate influence on European politics seem to be strongly confirmed by the news which has since arrived. If the Emperor ever expected to get any military support from Austria, he must by this time be undeceived. There is no fight left in her, and if she can be kept alive during the next twenty years, even with the aid of peace and rigid economy, it will be a miracle of statesmanship. Luckily for her the Imperial Government seems at last to have found out that the road to safety lies through popular freedom.

A special despatch to the New York *Tribune* from Constantinople, published on Tuesday morning, and to which that journal itself evidently gives full faith and credit, announces that the Russian ambassador at Constantinople has presented an ultimatum "asking for the cession of Crete to Greece, and the full equality of Christians and Mohammedans in all the provinces of the empire." On this *The Tribune* yesterday based an "announcement" of "a movement on the part of Russia which probably assures the speedy dissolution of the Turkish Empire, and may be the signal of a general European war." We trust the public will not be in any haste to give credence to this story. There is every reason for believing it to be three-fourths fiction. The Turks and Christians are already equal in all the provinces of the empire *in form*, and that Russia thinks *now* of an attack on Turkey without a fleet in the Black Sea is so wildly improbable that everybody is justified in disbelieving it till he sees the despatch. This view of the case is confirmed by the fact that there is no trace of the news from England, where, if true, it would certainly cause a panic in the funds.

While upon the subject of Cable despatches we may mention that, as there are no questions pending between Prussia and the United States, the invitation to dinner given to Mr. Bancroft by the King of Prussia a fortnight ago, and which the Cable newsman reported with great solemnity, had no particular meaning. Neither had the ride back to Berlin in company with the King, and "in the royal coach," which Mr. Bancroft, as we learn from the same veracious chronicler, afterwards enjoyed. Consequently, we could very well have waited for the news to reach us by the regular mail.

Marshal Bazaine has suffered a good deal at the hands of the press since Maximilian's execution, but has at last found a defender in the person of Count de Kératry, who, in the *Revue Contemporaine*, with the aid of "unpublished documents," threw all the blame on Maximilian. This brought out the *Indépendance Belge*, which formally charged Bazaine with the responsibility for the decree of October 3; and moreover, with having shot General Romero, a distinguished Liberal leader, who had surrendered on promise that his life should be spared, and this in open defiance of the wishes of the Emperor and Empress. Whereupon Count de Kératry appears once more, showing that Romero was a common bandit of the worst order; that Maximilian never sought to save him, and that therefore the marshal had not on Romero's account insulted Maximilian; and, finally, that the "fatal decree" of October 3 was conceived and composed by Maximilian himself, and drawn in his handwriting, and that the original still exists. This, if true, is a "crusher." The *Indépendance* also publishes a letter alleged to be written by General Porfirio Diaz, charging the marshal with having offered to place Maximilian, Miramon, Marquez, and, in fact, the whole imperialist circle, in his hands for a consideration, the nature of which is not stated. This, however, is certainly untrue and wildly untrue; and if Diaz ever wrote it, he did so under the impression that French officers can occasionally be as great scoundrels as some of his own comrades. They can, no doubt, be scoundrels; but then their scoundrelism is not apt to be of the Mexican kind, or anything like it. No marshal of France who did a thing of this kind could ever show his face in France, though to a Mexican soldier this may seem incredible.

The publication of the *Alabama* correspondence shows that Mr Seward has sought to have the recognition of the South as a belligerent treated as part of the same transaction as the letting loose of the *Alabama*, and has also sought to make the cession of some British territory on this continent the basis of a settlement, all of which proposals Lord Stanley declines. The matter will probably remain as it is until the reconstruction business is settled, inasmuch as the public mind here is too much occupied with home affairs to exercise any pressure with regard to any portion of the foreign policy of the Government. Mr. Seward, too, is satisfied, and he may be, that time tells in his favor. Every day inclines public opinion in England more and more in the direction of conciliation of the United States, even at a heavy cost.

Two incidents have recently occurred in France which present the bad points of the Bonapartist régime in a striking light. A country schoolmaster, who had served with credit for ten years, turned Protestant. He was instantly dismissed by the préfet, and, immediately on his dismissal, he was seized and put into the army, having been exempt from military service while acting as a teacher. The newspapers cried shame, however, and the préfet threatened them, but the case was too outrageous and they refused to be silent; so the noise reached Paris, and the préfet was ordered to restore the teacher to his position, and put him at the head of a Protestant school. In the other case an unoffending man was set upon, kicked, cuffed, and locked up for the night by the police, because the crowd in his neighborhood had cried "Vive la Pologne" during the Czar's visit. He sued the policeman, but the court decided that the policeman, being a "state functionary," could not be sued without the permission of the Council of State, which is hardly ever given, and in this instance was refused. So the plaintiff has to pocket his kicks. It is a singular fact that, although the meanest intelligence can see that, unless functionaries are liable to prosecution before the public tribunals like other citizens, all guarantees for personal liberty are worthless, not one of the Continental nations has in any of their revolutions attempted to make any change in the rule. There is a vague feeling, even amongst the radicals, that if policemen might be sued, the framework of society would break up.

Mike McCoole, the "champion of America," was honored with a grand procession in St. Louis, on Saturday last, while General Sheridan received a similar mark of respect in the same place on the following Monday, McCoole's being the heartier of the two, and reported in the St. Louis papers with the usual accessories. It appears, what we did not know before, that the "Ohio mill" was an international affair, Jones representing the hated Saxon, and the pounding he got, including the breaking of his ribs, being part payment for "seven hundred years of wrongs" inflicted on McCoole's native land by the British. In the address delivered to the champion by the "Committee of Reception" poor Jones is spoken of as the representative of the "despotic power that has oppressed your [McCoole's] countrymen in so marked a manner during long years of cruelty and barbarity." This is rather hard on Jones, as he is, we believe, a Hebrew, and to make him expiate English oppression of Ireland in the "ring," his own race having suffered so much from it, is an outrage on justice which we hope the Fenian senate will see to. McCoole's next victim is to be a person of the name of "Jim Elliott." He is an American, and we presume will be held to be the representative of New England fanaticism, and atone for it literally "in the flesh." He will have his nose broken for the Quaker hanging, his eye bunged up for the witch-burning, and his teeth knocked out for emancipation, the Constitutional Amendment, and the prohibitory law.

Notes.

LITERARY.

In addition to former announcements Messrs. Hurd & Houghton are preparing the following new works: "Principles of the Law of Contracts," with examples of their application, by Theron Metcalf, LL.D., late judge of the Supreme Court of Massachusetts; "The Three Holy Kings," a holiday book with photographic illustrations; "Poems of Faith, Hope, and Love," by Phœbe Cary; "Poems," by Elizabeth C. Kinney; "Grandpa's House," by Helen C. Weeks; "The Diary of a Milliner," by Belle Otis.——Mr. Scribner opens his fall series of publications with Dr. Holland's "Kathrina," a poem, as we understand, mainly narrative, but interspersed with some dramatic and lyrical composition. The theme is one which the author has treated objectively in his novel of "Miss Gilbert's Career"—the proper influence of woman as the guide, supporter, and controller of man, and the man her husband.

—The Committee of Weights, Measures, and Coins at the Paris Exposition have made a report in which they urge all governments to adopt the metric system, and put aside their old weights and measures. They call attention to the fact that, as experience has shown, a long delay does not facilitate the change, and that it is not enough merely to legalize the metric system. The steps which it is desirable to take are (1) to order this system to be taught in all public schools, and to form part of all public examinations; (2) to introduce its use into all scientific documents, statistics, postal arrangements, custom-houses, and other branches of the national administration. As for the first recommendation, Congress can, of course, only advise; the State legislatures must direct. The post-office will probably have to wait till our currency has been adapted to the standard of the five-franc piece. But in all the remaining particulars there is no reason why the suggestions of the committee should not be complied with. There is no country in which there would be so little difficulty in making the change understood and in persuading the people to accept it as in ours, with a properly concentrated effort through the schools and the newspapers. Already we have several text-books and manuals on the subject, and these would multiply as needed. Mr. Kasson will, we hope, at the next session of Congress, reappear as the champion of this international reform, being fortified by his observations while in Europe this summer.

—The Abbé Migne's vast publishing house near Paris is the subject of an interesting article by Rev. Dr. McClintock in *The Methodist Quarterly Review* for July. It has been established only twenty-one years, and has reached a manufacturing capacity of two thousand quarto volumes every twenty-four hours. Among the works produced here is a complete course of the Greek and Latin Fathers—a library in itself, and the editions are valuable in a critical point of view. Copious indexes, both alphabetical and analytical, unlock to every enquirer the contents of these tomes, which number for the Latin two hundred and twenty-two, and for the Greek one hundred and sixty-seven. They are uniform in size, imperial octavo, and are a marvel of cheapness. By the set, in paper covers, the Latin Fathers cost only five francs the volume; the Greek Fathers, with a separate Latin version in eighty-four volumes, cost eight francs each. For half-sheep bindings thirty-five cents extra are charged. But this is only a part of the abbé's undertaking, and might seem not so wonderful if compared with the statistics of other publishers. He has issued, also, a "Complete Course of Commentaries on the Scriptures," twenty-eight volumes, imperial octavo; a "Complete Course of Theology," to match the foregoing in number and size; the evidences of Christianity, or "Démonstrations Evangéliques," containing the entire works of one hundred and seventeen writers; and three theological encyclopædias, of which the first was in fifty-two volumes, at 312 francs, in paper; the second in fifty-three volumes, at the same price; the third, now just being completed, and still theological—proving, although positively advertised as "the last," that there is no end to theology—in sixty volumes. Upon these are yet to be mentioned a "Church History," from the Creation to Pope Pius IX., twenty-one volumes; and a "Collection of Christian Orators," one hundred volumes, embodying the best utterances of two hundred and fifty preachers, with a history of preaching from the beginning. The great libraries of all countries are, of course, reliable customers for such solid works as these, which have proved under prudent management a fortune to the abbé. The unvarying size of volume, which permits a simplicity that becomes a wealth of resource in the mechanical department, and the cheapness of the series, have ensured popularity to the issues of this house, which, for the rest, has the confidence of scholars of whatever faith, and is creditably free from sectarian narrowness and deception. The abbé's example, it seems to us, might be judiciously imitated under changed conditions by publishers who are content to relinquish the ephemeral, and to seek their reputation and success in the wisdom which is not for a day but for all time.

—We ventured, some weeks ago, to review the concluding volume of Bunsen's "Egypt's Place in Universal History," and to examine the definite results of Egyptology. The subject is one which we could not hope would interest all our readers, and might have feared would be passed over by some as too "heavy." We should like the latter to see the way in which the same work is reviewed in the London *Chronicle* of August 24. Erudition, we need not say, is not spared; so neither are hieroglyphics, which are freely distributed throughout the article in aid of the text. A strictly "popular" treatment would, perhaps, have precluded the use of these characters; but they are by no means so formidable as they look. The words they depict illustrate the basis of Egyptian philology, and testify to the soundness of the methods now used in interpreting hieroglyphics. They also bear on the question of an Egyptian dictionary, and the reviewer, in fact, criticises the specimen-page of Dr. Brugsch's lexicon, which we announced last week. While we are on the subject, we may note a recent monograph on Egyptian chronology, by Mr. Unger ("Chronologie des Manetho." Berlin. 1867.) It maintains the correctness of Manetho's order, and arrives at a primitive period of 24,925 years and three "tomes," namely, the first consisting of eleven dynasties, 2,300 years; the second of eight dynasties, 2,121 years; and the third of eleven dynasties, 850 years, ending with Alexander in 333 B.C.

—*The Chronicle*, we may as well say here, is distinguished from its fellow weeklies in London, first, by a little more openness in typography and a little less formal arrangement of its articles, and then by perhaps not greater scholarship, but apparently by a more intimate connection with the best scholars, and these devoted to special subjects. With two exceptions its staff of contributors embraces all those by whom the late *Home and Foreign Review* was supported—a publication that took a high position among scholars. In politics its specialty is, to quote its prospectus, "to form, in the centre of the empire, a sound public opinion on the affairs of Ireland—just to her grievances, mindful of her interests, and favorable to her prosperous development." With this view a "considerable number of Irish writers of known ability, learning, and popular sympathies" have been engaged to conduct the discussion of Irish questions. Finally, Continental works receive earlier and more liberal attention than in the other papers of the same class as *The Chronicle*. Its editor is Mr. Frederick Wetherell. The first number appeared on the 30th of March.

—Dr. Forbes Winslow writes a letter to *The Pall Mall Gazette*, and promises another on the same subject, concerning "a sound and disposing mind." He holds that what is called partial insanity, or monomania, is not sufficient to prove, of itself, a testamentary incapacity. "I have often," he says, "witnessed among the insane the possession of delicate, just, and honorable ideas respecting their own social position, and the pecuniary claims of those most near and dear to them." He approves the action of ecclesiastical judges in former times, who, when a will was brought before them to be contested, enquired first if there was *prima facie* evidence in the wording, arrangement, etc., of the will that its author was insane; and next whether the testator's lunacy was visible in the distribution of his property. If neither of these points was established, the will generally stood against unquestionable evidence of mental unsoundness or eccentricity in other things. He quotes, as if endorsing it, the decision of Sir Herbert Jenner Fust, in the case of Morgan *v.* Boys, where the testator left a large fortune to his housekeeper, and directed in the same will that his executors should make fiddle-strings of part of his bowels, and smelling salts of others, and that the rest of his body be vitrified into lenses for optical purposes. He did this, he said, to mark his moral aversion to funeral pomp. It appeared that he had conducted his affairs with great shrewdness and ability.

—Those to whom the article in *The North American Review* for July suggested some new ideas in regard to the origin of the Italian language, will be glad to consult a work not named by the writer, which, however, sustains his view that the Italian is the vulgar Latin of former days by continuous descent. This is "Der Vokalismus des Vulgärlateins," by Dr. H. Schuchardt (Leipzig: Teubner). It is spoken of as written in none too perspicuous German, but as ably covering the field of discussion. The author presents the written sources of truth concerning this mostly unwritten tongue, and collates all the instances in which the proper pronunciation of classical forms may be inferred. For example, finding *malefacta* rhymed with *apta*, we see the original of the Italian *fatto, atto*, etc. *Meum*, pronounced as a monosyllable, gives us the French nasal *mon*, and explains the

elision of final syllables in *m* before a vowel by the poets, or, perhaps, we should say, the swallowing up of that vowel by the nasal, as in *meumst* for *meum est*. Dr. Schuchardt also elaborately divides the folk-Latin into periods, and makes Ennius do for the permanence of the language what Luther did for the German, rescuing it from further deterioration from this obscuration and syncope. Finally, a sketch is attempted of the mode in which the several Romance languages were developed from the popular speech, which assumed its sway upon the dissolution of the Western Empire and the rise of Christianity.

—*A propos* of the late abolition of imprisonment for debt in France, the celebrated *avocat* and politician, M. Berryer, has published some reminiscences in which he describes former inmates of the prison of Clichy. "In my time," he remarks, "Maximilian, ruling Duke of Zweibrücken, afterward King of Bavaria, was incarcerated by his creditors. For long years I have seen Lord Mazereene, an immensely rich man, in the debtor's prison. Mazereene was imprisoned for a considerable debt in bills imposed upon him, as he represented, by cheating in play, the payment of which he refused. He spent in prison an income of 100,000 francs, kept open table, and furnished his mistresses with an equipage and a box in each theatre. A Mr. Swan, an American, was twenty-two years at Clichy. In the numerous pamphlets directed against his creditors, he invariably began with the statement that he had estates in the United States worth more than five millions; that he could pay the demands of his creditors twenty times over; but that these demands were unjust, and he would never recognize wrong as right by their payment. Mr. Swan was fifty-two years old when brought to prison, and left it, in consequence of the July Revolution, seventy-four years old. He died two months afterwards."

—Competition among the publishers of the German classics has brought them within reach of the most moderate means. Schiller's poems, complete, are offered for two and a half silbergroschen, or six cents. This very cheapness, however, prevents the much-needed correction of the text of some of them. There are over four hundred unmistakable errors in the current editions of Goethe's "Werther" alone, and, until a society is formed for the purpose, there is little hope that the emendations will be made. The Goethe manuscripts are still preserved at the Cotta publishing establishment in Stuttgart. Goethe's habit of disregarding the subjective occasion of his writings in his later corrections of them, has left open a door for endless controversies whenever an attempt shall be made to establish definitively the text. The German "Dante Society" will meet at Halle on the 3d and 4th of October, when some of the admirers of the poet may, like their Shakespearean friends, affirm that he is better understood and appreciated in Germany than in his own country.

—The custos of the Bibliotheca Ambrosiana at Milan found, some years ago, an apocryphal codex, the Latin translation of a Greek original of the "Prophetia et assumptio Mosis"—the prophecy and ascension of Moses. Herr G. Volkmar, of the Zürich University, has, by a careful study of the text, concluded that this book was a direct source, and even an authority, for the author of the Epistle Jude, and for the author of the second Epistle of Peter ("Mose Prophetie und Himmelfahrt. Eine Quelle für das Neue Testament. Von Dr. G. Volkmar." Leipzig. 1867.) He regards both of the epistles as post-apostolic, the second a new version of the first, but both of them simply extracts from the apocryphal codex, which is a Hebrew apocalypse. The codex itself belongs to the sixth century; the original may have been written in 137 A.D., as Herr Volkmar endeavors to prove in his book.——A new edition of Professor A. T. Hoffman's "Grammatica Syriaca" has just been edited by Dr. A. Merx, of Jena ("Grammatica Syriaca quam post opus Hoffmanni refecit A. Merx. Part I." Halis. 1867.) The work is based on the results of the studies of the eminent German Orientalists, Gesenius, Bernstein, and Ewald, and on the principle that, just as in the study of the Indo-Germanic languages we must go back to the primitive language, the Sanscrit, a similar course must be followed in the study of the Semitic languages, the Syriac included; namely, the latter must be traced to the primitive Semitic language. Improved by Dr. Merx, by his adding the latest philological results, the grammar possesses great value for scholars interested in comparative philology. The first part of the work treats of consonants, vowels, accents, punctuation, etc., and is profusely interspersed with well-printed Syriac characters.——A collection of German poems of the time of the Reformation, presenting by characteristic selections an image of that epoch, has been published by Messrs. Goedeke & Tittmann ("Deutsche Dichter des sechzehnten Jahrhunderts. Herausgegeben von K. Goedeke und J. Tittmann. I. Liederbuch des sechzehnten Jahrhunderts." Leipzig. 1867.) The "Lied" has from the earliest times formed an essential element in the public and private life of the Germans. It was even conserved by the people during the Middle Ages against the will and command of the Church, which, by councils and orders, interdicted those "Teufelslieder," especially the "Minnelieder" (love songs), then more in favor with the people than epics like the "Niebelungen," "Dietrich von Bern," etc., which had gone out of vogue. The poetry of the sixteenth century became more polished and more restrained in a moral point of view, and from being in High-German is of greater interest to modern readers. In this epoch the spiritual songs, too, began to emancipate the Germans from the Latin language, hitherto only used for church songs.

—The library of Professor Edward Gerhard, who died May 12, at the age of 72, has been offered to the Prussian Government, but declined for want of funds with which to purchase it. The collection numbers more than 3,000 separate works, devoted almost singly to archæology, and embracing almost everything valuable relating to that subject. The first degree of Ph.D. awarded by the University of Berlin was given to the deceased in 1815. He very early displayed his antiquarian tastes, and having weakened his eyes by a too zealous study of the manuscripts of Pindar, he went, in 1820, to Italy to recruit his health. His visit happily coincided in point of time with the opening of the Etruscan sepulchres, in the carvings and paintings of whose vases, mirrors, etc., Gerhard discerned a new means of portraying ancient life and manners. In the winter of 1826, at Rome, he founded, with Bunsen, Plattner, and Urlichs, a society of topographical research, for which Niebuhr procured the patronage of the Crown Prince (Frederick William IV.), and which developed into the renowned "Institution for Archæological Correspondence," having members in all countries. Eight hundred plates had been prepared by Gerhard, representing with the most scrupulous fidelity the ancient monuments of art which he had so thoroughly studied, but by a mistake only three hundred got printed, while the rest were destroyed. In 1839 he was appointed director of the Archæological Museum at Berlin, and in completing, arranging, and cataloguing its treasures his labors were invaluable. From them he published two collections of engravings—the first, of Etruscan vases, with four hundred plates, partly colored, now out of print; the second, of Etruscan mirrors, with about the same number of illustrations. In 1841 he founded the Berlin Archæological Society. Some of his smaller works and fragmentary writings he had begun to gather together for publication before his death. The first volume has now appeared, and Dr. Otto Jahn will edit the remainder.

AMERICAN SCHOOLS SEEN BY ENGLISH EYES.*

One of the chief defects in the American school system is the lack of authentic means of comparison between the work of different cities and States, both in respect of the methods employed and the results attained. The Connecticut system is not that of Massachusetts, in details, and St. Louis differs from New York. The local responsibility, the freedom, which is nearly absolute, from rigorous inspection by the State authorities, and the entire lack of national superintendence, with all their advantages bring this disadvantage. It is exceedingly hard to ascertain the manifold local modifications of the general principles of public instruction, and it is even more difficult to reduce to a fair standard of comparison the cumbersome statistical tables which are published respecting every State and town, and almost every district.

Consequently, to understand the American public school, prolonged personal enquiry and observation are essential. A greater service could hardly be rendered to the country at the present moment than to secure, by the agency of the Peabody Educational Trustees, the National Department of Education, or some other instrumentality, an impartial, minutely accurate, and yet philosophical survey of the various systems in vogue from Massachusetts to California. The work can be well done only by our own citizens, for none other can appreciate the unrecorded influences of historical usages and traditions, and the uncodified regulations required by public opinion. But till such a survey is made, the educators of the country may derive great help from the observations of intelligent foreigners, who come of their own accord, or at the instance of their governments, to examine the theory, the process, and the results of our boasted common schools.

Several such reports have been published in Europe. In England, Mr. Tremenheere; in Saxony, Dr. Wimmer; in France, Mons. de Laveleye; and in Sweden, Dr. Siljeström, have printed more or less extended treatises on the peculiarities of our educational system, with critical comments and ju-

* "Report to her Majesty's Commissioners appointed to enquire into the education given in schools in England (not included within her Majesty's two recent commissions), and to those appointed to enquire into the Schools of Scotland, on the Common School System of the United States and Canada. By Rev. James Fraser, M.A., Assistant Commissioner." London. 1867.

dicious comparisons, so that there are few of our own citizens who may not with profit peruse these statements. The latest document of this character is the report of Rev. James Fraser to the "Schools Enquiry Commission," lately presented to both Houses of Parliament by royal command, and received from England by a recent steamer.

In matters of judgment so much depends upon the judge that our readers may be interested in knowing something of the author of this extended paper. Mr. Fraser, as we are informed, is a clergyman of the Church of England, the rector of the quiet parish of Ufton, near Reading. He is, or he was until quite lately, still a fellow in one of the Oxford colleges. The impression which he made upon all who saw him during his visit to this country was that of a scholar, candid, unprejudiced, and thorough, who made it his business to find out, as truly as he could, the condition of our schools. He was neither blind to virtues nor defects. His intelligent and courteous manners made it a pleasure to help him; his acquaintance with schools of every grade in England, from that of the country parish up to the university, gave a point to all his investigations, and the comparatively deliberate manner in which he journeyed made his observations of more than ordinary value. We have, therefore, been waiting with some eagerness for his report, and have read it with unusual interest. His attention was chiefly directed to common schools—not to colleges or endowed academies or charitable establishments or scientific schools, but to schools intended for all classes in the community, from the lowest primary to the high-school. The five months of his visit were spent in the three southern States of New England or in States further west most affected by their educational influence—New York, Ohio, and Illinois. He also spent some time in Pennsylvania, and made a special study of the cities of St. Louis and Detroit. Part of his time was spent in Canada.

The tour of Mr. Fraser was made in the summer of 1865, when the war was but just concluded, and it is worthy of note that the vigorous support of our schools during the absorbing conflicts of civil commotions made a strong impression on his mind. Never, he says, were appropriations or benefactions more liberally bestowed; never was there more earnest determination to carry onward the education of the people.

Six comprehensive topics were mentioned in his instructions as requiring special attention; namely — 1, School legislation; 2, Pecuniary support; 3, Administration, and the selection of teachers; 4, Internal organization, modes of teaching, books, etc.; 5, Results; 6, Religious training. In short, he was directed to find out all that he could in the time and with the means at his command. He sums up his remarks on the system of the United States in four chapters, devoted first to an exhibition of the theory; then to an exhibition of the practice; third, to a critical estimate of results; and lastly, to a very brief horoscope of the future.

The theory of our schools he finds best stated in formal terms in the Massachusetts laws, which he quotes with extended notes and comments. We need not detain our readers with this familiar topic.

Under the head of practical operations, the cost of our schools is the first subject he takes up, and here he runs against the common difficulty of securing definite statements made up on the same schedule. However, he makes an estimate worth quoting, which is based on the reports of eleven of the first cities of the Union. Here are his figures for the "average cost of tuition only":—Detroit, $6 59; Toledo, $8 34; Chicago, $8 69; Providence, New Haven, $8 85; Philadelphia, $9 17; St. Louis, $9 38; Louisville, $11 17; Cincinnati, $11 42; Boston, $11 48; New York, $12 04; average, $10 39; or, £1 11s. 6d.

The cost of high-schools he estimates as on the average $62 50, or nine guineas, a year for boys; and $36 25, or £5 10s., for girls. In the rural districts the cost of tuition is much less, especially in the simple district schools. These prices are evidently in great contrast with what is paid in England for the corresponding advantages—so that it is the sober conclusion of the writer that an American farmer educates his family at the cost to the community of not more than one-third of the amount at which the Committee of Council estimate the cost of educating the children of an English mechanic or laborer.

The administration of our schools by the various boards, committees, superintendents, and the like, he found "somewhat complex," but appearing to "run smoothly," though not quite "hierarchical," or authoritative enough to produce the best results. Our teachers for the most part appear quite inadequately trained for their work, and the certificates of examination are really worth but little. Yet there is great natural aptitude for the teacher's work, especially in the women who engage in it. They have a gift of turning what they know to the best account, are admirable disciplinarians, and their classes are not likely to fall asleep in their hands—and on the whole, as he rightly adds, they are a fine and capable body of workers in a noble cause. Their salaries, judged by an English standard, are low, and consequently changes are frequent. Their social position, on the other hand, is much higher than in England. The formal and "memoriter" character of our recitations and examinations is justly censured. But how can this be otherwise, unless our colleges, the highest teachers of the land, will modify the example which they set? So long as "cramming" will pass for learning; so long as the ability to receive page after page of Greek grammar, rules, exceptions, and examples is deemed the greatest evidence of intellectual culture in college, as it was where we were educated, so long will our instruction in high schools and grammar-schools be governed by text-books, and deal more in conventional phraseology than in positive knowledge.

The gradation or classification of our schools commends itself strongly to the approval of Mr. Fraser, but our own teachers are unanimous on this subject, and we therefore pass by the comments of our traveller.

There is another subject on which we think Mr. Fraser's observations are less just than we have commonly found them to be. We refer to the social status of the scholars in our public schools. By the theory, he says, scholars of every rank are supposed to come within the sphere of the system. This is ambiguous. All children may avail themselves of the privilege; it is not expected that all will. Every parent is as free to decide this question as he is to determine whether he will use the common park, the common post-office, or the common pump. The public merely provide public schools "good enough for anybody;" no one is forced to accept their privileges. This being the theory, what is the result? In our opinion it varies from year to year and from place to place. A good building, a judicious committee, a corps of capital teachers, will revolutionize a town or a district speedily, and the school forsaken one year may be crowded the next. Mr. Fraser, on the other hand, asserts that "in all the cities the wealthier class, indeed all who can afford to do so, almost without exception, send their children to private schools." We are confident he has generalized too rapidly. Many wealthy people, we admit, withhold their children from public schools; but, on the other hand, in a city not very far from New York an important public controversy has just terminated where the worst charge against the public schools was this: that those who could afford to send to private schools would send to the public schools, thus taking the places which should be saved for the poor. We can take Mr. Fraser to scores of schools in New York, New Haven, Hartford, Springfield, Boston, Roxbury, Cambridge, and other towns where we are acquainted, and show him that, beyond a doubt, the public schools, in practice as well as in theory, are for all. The distinctive feature of our system, in city or in country, is that the wants of the whole community are provided for, not those of any class. Because there is the post-office, no one is prevented from employing the telegraph or the private messenger; and just so with the school. Actually taken the country through, the distinctions of financial caste are not yet manifest in our schools or colleges. Long distant be the day! When the public school is the best school, men of culture will send to it. When it is not, they will seek instruction elsewhere.

But we cannot pursue these observations, for we still desire to call the attention of our readers to Mr. Fraser's estimate of the system as a whole, and his recommendations to the authorities at home.

Having reminded the English reader that from the days of Washington till now "virtue and intelligence" have been relied on as the safeguards of this republic, in which perfect social equality and absolute religious freedom are guaranteed by law, he delineates, in a few nice touches, some of the actual "phenomena" of American life; our "restlessness and activity, without, perhaps, the culture and refinement of the old Athenian, but with all his versatility; the absorbing interest of political life, the constantly rising aims of each individual, the ebb and flow of commercial enterprise, and the immense development of the spirit of speculation; the intense energy of the national temperament, its rapidity of movement, its precipitancy, its impatience of standing still." The American school, he says, is a microcosm of American life. It shows the same freedom and equality, the same rapidity of movement and desire of progress, the same ambition, sensitiveness, and subordination of the individual to the mass, the same utilitarian fever, the same absence of repose, elements of strength and weakness, of success and failure, so mingled that it is impossible, by one epithet, to characterize the resultant whole.

In his opinion, also, our school system is in harmony with the other institutions of the country, and it suits the people so far as they understand their own wants. He points out "the cheapness" of our schools even in liberal cities, and the lively "spirit of work" which is generated among both teachers and scholars. He sums up the results of the system (quite correctly, in our opinion) as tending to the general diffusion of intelligence

rather than to "high culture" or "profound erudition." The same is true, he might have added, of our colleges and of all our social educational influences. It is not the few who are carried to high perfection; it is the entire population who are lifted up from ignorance and want.

He fears that we care too little for development as compared with information, thinking too little of the *faculties* and too much of *facts*. He makes some just criticisms on our cultivation of the taste, doubting the national competency "to appreciate the beauty of simplicity;" and he misses with regret "the religious tone" to which he is accustomed in the conduct of the school-room at home.

In respect to the instruction of boys and girls in the same classes, a point on which our own administrators of schools are not agreed, Mr. Fraser makes some interesting observations. Doubting the wisdom of giving to girls the same instruction as to boys, he yet admits that where he heard the two sexes taught or catechised together he "should have given to the girls the palm for quickness of perception and precision of reply." In all their studies they "seemed fully competent to hold their own." To Americans he says: "The Roman matron of the old republic is, perhaps, the type of female excellence; self-reliance, fearlessness, decision, energy, promptitude are, perhaps, the highest female qualities." For himself he prefers a different theory of womanly culture; but he admits that the American method at least achieves the end at which it aims.

The religious character of our public instruction naturally attracts the attention of all foreigners accustomed to the union of church and state. Mr. Fraser objects to calling the American schools "irreligious" or even "non-religious" or purely secular. He sees and appreciates what is done in them for the inculcation of Christian morality; and while he prefers the "denominational" theory for English schools, he would consider himself "tendering a most fatal piece of advice" if he recommended its adoption here. All his views on this subject exhibit a beautiful spirit of fairness and liberality, such as we should like to see more general among our own religious people.

The object of Mr. Fraser's enquiries was practical. Popular education in England is sure to make progress with the growth of reform and the diffusion of suffrage, and it is with reference to possible changes in the national system that the "Schools Enquiry Commission" was instituted. It is interesting, therefore, to see what points so cautious and judicious an observer recommends to the imitation of his countrymen.

"*The* thing," he says, "which I should like to borrow is the noble public spirit, almost universally prevalent, which considers that to contribute to the general education of the people is the first duty, as of the commonwealth at large, so of every citizen in particular, and which places religion, morality, and intelligence in the forefront of the elements that constitute the strength and guarantee the prosperity of the nation."

Descending to particulars, he especially recommends that our system of graded schools be imitated in the large towns of England. "It is the one thing which our elementary schools have not," he says, "and which they most need. I do not care so much about *common* schools; I have no particular preference for *free* schools; but I do see most clearly the advantages of a *graded* school."

The second recommendation which he offers is that central boards of education should be instituted in counties or districts with more or less visitorial power, and with the obligation to publish an annual report. The great mass of Englishmen have now no authentic guarantee upon which to rely in selecting a school for their sons. The publicity of our public schools seems to Mr. Fraser one of their most commendable features.

The author of this report does not appear to have considered it his business to devise suggestions so much as to report observations. Indeed, he is continually embarrassed by the different circumstances, capacities, and prospects of the two countries. "I do not pretend to know where we are drifting," is a remark which he makes more than once. He sees impending in England the establishment of a secular system of instruction, akin, at least, to the American, and while he does not conceal his preferences for the denominational schools now in vogue, he does not hesitate as a clergyman to declare that he should neither despair of Christianity nor morality if the change, so much dreaded by many of his class, should actually come. He acknowledges, as the result of his travels in America, that what England needs is "*intelligent* education—a real quickening of the minds of the people," and he admits that his own difficulties as a clergyman lie in the slow and heavy intellectual movement of his hearers, their scanty vocabulary, their inability to appreciate an argument, their want of general and broad culture.

We have noticed some statements with which we do not agree, and throughout the entire report there is an obvious lack of acquaintance with the progressive development of our school system which would have enabled the writer to describe rather better some of its characteristics. The American public schools, as a system, have *grown* during two hundred years into their present form; they were not contrived or invented. They are adjusted, imperfectly we admit, but still adjusted, to all our other institutions. To be understood, our social life must be understood, and this no traveller, however accomplished, can be expected to understand. Mr. Fraser has done more than most observers. His patience, his fairness, his sagacity, and his ever-present love of truth are reflected throughout the American portion of the volume. We have not read the Canadian chapters.

As the conclusion of all his researches, it is gratifying to find him ready to admit "it is no flattery or exaggeration to say that the Americans, if not the most highly educated, are certainly the most generally educated and intelligent people on the earth." This is the true fruit of republican common schools.

DRAPER'S CIVIL WAR IN AMERICA.*

Dr. Draper has furnished, during the last few years, more striking examples of sweeping and fallacious generalization than any modern author of equal pretensions; and some of his fallacies have been of a kind into which one would not have expected a gentleman to fall who was as familiar as he must be with physical science, even if he had not prepared himself for the work of moral and political speculation, into which he has so largely entered, by a study of formal logic. There is probably nothing which renders a book so popular in a community like this, in which, while the number of readers is enormous, the number of persons at all versed in the reasoning process is small, as just such wide and confident conclusions about human society as he furnishes. The mass of the public hates doubts or distinctions or exceptions. It hates to have an author drag it through the tedious process of analysis. It likes to have him come with his hands full of results, as the popular lecturer and the preacher do—results about which there is "no manner of doubt;" and they are doubly welcome when, as in Dr. Draper's case, they not only explain nearly everything that is puzzling in history, but light up the whole future to the remotest ages. For instance, in his "Civil Policy of America" he rang changes throughout on that most pleasing but most palpable of popular fallacies, that there is an analogy between the life of nations and that of individuals. The average reader likes these analogical illustrations—they make things seem so simple; but the falsehood of this one has been over and over exposed by the leading writers on logic. In fact, Mr. J. S. Mill makes it one of his illustrations of "fallacies of generalization," because, he says, "the decay of vital powers in an animated body can be distinctly traced to the natural progresses of those very changes of structure which, in their earlier stages, constitute its growth to maturity; while in the body politic the progress of these changes cannot, generally speaking, have any effect but the still further continuance of growth; it is the stoppage of progress and the commencement of retrogression that alone would constitute decay. Bodies politic die, but it is of disease or violent death; they have no old age" ("System of Logic," Vol. II., p. 361).

In the work before us Dr. Draper pursues what Mr. Mill has happily designated—in his enumeration of the methods which in enquiries in political science should *not* be used—the "geometrical method." That is, Dr. Draper takes one cause, climate—just as Hobbes took fear, and the Benthamites took self-interest—and makes it account for nearly every social phenomenon with which he has to deal; but, unlike Hobbes and Bentham, he hardly argues at all, but asserts, and that with an air of confidence well calculated to persuade the general reader that his method, instead of being notoriously fallacious, was universally accepted as safe and sound. There are, we hope, very few men of Dr. Draper's attainments, and, above all, possessing Dr. Draper's taste for sociological investigation, who do not know that social phenomena are the most difficult of all phenomena to account for; the reason being that, while we know, as a matter of fact, that the influences which produce any particular type of national and individual character are almost infinite in number and variety, we are absolutely unable to test the power of any one of them by experiment, or to test fully our experiment by observation. Climate, no doubt, influences character very largely, but so many other things influence it also that it is not in the power of any human being to say how much of the character of any given community must be ascribed to climate and how much to other things.

Dr. Draper, however, although a philosopher by profession, is not troubled by any of these difficulties, and the result, as displayed in the introductory chapters of his book, is really amazing. To general resemblances between

* "History of the American Civil War. By John William Draper, M.D., LL.D." In three volumes. Vol. I. New York: Harper & Brothers. 1867.

countries very little importance, he says, is to be attached; "for *political reasoning*, we *must follow the surer guide of isothermal zones*." So he draws an isothermal line across Europe and America, and then begins his "reasoning." Here is a specimen of it:

"Many illustrations might be offered of the influence of nature over modes of thought. The January isothermal line of 41° marks out in a general manner the *final* boundary between the Catholic and Protestant peoples of Europe. To those living on the south of it, an embellishment of worship is acceptable; to those on the north, a more simple or austere form" (p. 93).

The isothermal line in question, however, as it appears in his map, conveniently leaves the province of Ulster, in Ireland, which is, of course, Protestant, to the north (of this fact he makes special mention, evidently considering it very striking); but then it so happens that in the reign of Elizabeth the Earl of Tyrone rebelled; his rebellion was put down after a fierce struggle, and his lands and those of the chiefs who acted with him were confiscated, and on this confiscated region Scotch colonists were settled in great numbers in the following reign, and to-day their descendants constitute the Ulster Protestants; while a little further west, in regions not confiscated, being less attractive, but in the same climate, the Catholic Celt still holds his place. Now, it may be that it was the climate which made Tyrone rebel, and Elizabeth subdue him, and James settle Protestants on his estates; it may be that had Ulster been south of the line he would not have rebelled, and the Scotch would not have come over to Ireland, and Ulster would still be Catholic; but of this we are sure, that whether the Ulster Plantations were due to the climate or to Tyrone's having taken a little too much usquebaugh, neither Dr. Draper nor anybody else in the existing state of science can tell. The same line, we observe, leaves France and Catholic Germany, and Catholic Switzerland, and Russia, which is Catholic in Dr. Draper's sense, all to the north of it, or, in other words, on the Protestant side. In fact, it has nothing on the south of it except Spain and Italy, which, after making all due allowance for inaccuracies and disturbing causes, is rather unfortunate, if we are to depend in our political reasoning on isothermal lines. But even if it did cut off France and Germany *in toto*, we could find in history half a dozen causes, each sufficient to account for these countries being Catholic, and none of them connected with climate. We might be wrong in the amount of importance we ascribed to them, but we should defy Dr. Draper to prove that we were.

On p. 113 he actually undertakes to predict with scientific certainty what kind of men will inhabit the Southern States of this Union from an examination of the kind of men to be found in ages past in the same zone on the continent of the Old World, and notably the coast of Northern Africa. He concludes it will be a warlike population, from the fact that Carthage was a warlike state, and that the city, when at last taken, "was literally conquered street by street and house by house." The women of the Southern States, he predicts, "will rival, perhaps exceed, in patriotism the men." He deduces this conclusion from three facts: one is, that Asdrubal's wife, when he submitted to the Romans, "appeared on the roof of the burning temple of Æsculapius, and, upbraiding him with bitter taunts for his surrender, threw herself headlong into the flames;" the others are the following:

"It was in this zone, though far to the east, that Zenobia, the Palmyrean queen, resisted the Emperor Aurelian; on the banks of the Euphrates the jewelled dromedary of that dark-eyed, fleeting beauty was overtaken by the light horse of Rome—in this, her exemplar Cleopatra, the Egyptian daughter of the Macedonian kings, was bitten by an asp brought to her in a basket of flowers, to escape being led in the triumph of the conqueror."

This is very fine, but it is not reasoning. If we had the space to do it in, we could tell on the same plan some wonderful stories about the kind of men and women that will flourish in portions of the Northwest. The exploits of the Karduchians, for instance, as recorded in Xenophon's "Anabasis," would go far to show that the future population of portions of the Hudson's Bay Territory will be what a Westerner would call "ring-tailed screamers."

It appears, also, that we may fairly expect the Southerners of the future to be cruel. The ground for this expectation is the atrocious manner in which the Carthaginian inhabitants of the same zone behaved in the great conflict with their slaves known as the "Inexpiable War;" and secondly, the conduct of Marshal Pelissier in smoking the Arabs to death in the cave, twenty years ago. This last effect of the isothermal line on the human character is the most remarkable we have yet met with.

The negro, according to Dr. Draper, ought *not* to be found naturally on this continent, though he is found in other portions of the Southern isothermal zone; that is, Dr. Draper *knows* the conditions necessary to produce a negro; he *knows* that none of these conditions are present in the Southern States. Why, then, is the negro in other parts of the zone? The answer which Dr. Draper gives is, according to him, "singular and satisfactory."

"The recession of the Mediterranean Sea from the desert of Sahara, and its contraction within its present boundaries, *had doubtless much to do with the possibility of negro life* . . . [in Africa.] Had the Mediterranean retained its old boundaries, *the negro type of man would never have been called into existence*. . . . In my work on physiology I have shown how darkness of complexion is connected with the action of the liver, and that the secretion of black pigment into the cells of the skin takes place under the influence of a high temperature and moisture. The conditions for the production of the negro did not exist in America. There was no topographical expansion sufficient at Panama. The construction of Central America is the converse of that of Central Africa; the Caribbean and Mexican Seas replace the sands of Sahara and the pestilential everglades of Soudan. In Africa the winter isothermal line of 55° marks out the true boundary of negro life. In America that line skirts the southern edge of the Gulf States. *It is plain, then*, that, were it not for the artificial climate created by civilization, the negro would be an exotic in all the domain of the republic except in the southern verge of Texas and Louisiana and in the peninsula of Florida."

By a similar process of reasoning, we are led to the conclusion (p. 103) that "the arts of Eastern life, the picturesque Orientalism of Arabia, will be reproduced in our interior sandy desert, the love-songs of Persia in the dells and glades of Sonora, and the religious aspirations of Palestine in the similar scenery of New Mexico."

At page 101, Dr. Draper shows that the continuousness and variety of labor permitted by the Southern climate make the Southern man confident, and therefore too "indolent," wanting in foresight, prone to act without reflection, irregular in his habits, and impulsive; while the uncertainty of the Northern climate makes the Northern man thoughtful, cautious, and provident. But at page 125, however, he maintains that the "certainty of the climate in Peru and ancient Egypt gave a man a remission from the cares of the future, and an opportunity of turning from the low gratification of animal instincts to the improvement of his mind."

We might fill our whole paper with illustrations of the same sort of Dr. Draper's singular understanding of the limits between reason and imagination; but we must content ourselves with one more. "What is the reason," he asks, "that on the earth's southern hemisphere no great man has yet appeared?" The reader, we are sure, will never guess. The answer is that "the January isothermal line of 41° is, in the southern hemisphere, altogether a sea line. It touches the land at no point" (p. 124). This line at the north, according to Dr. Draper, "is the axis of a zone, a few degrees wide, upon which, in Europe and Asia, all great men have appeared." But as this zone at the south runs over sea water, and great men can appear in no other, and as men are land animals, of course the southern hemisphere has produced no great men—*q. e. d.* We refer readers who suspect us of joking or travesty to the work itself.

Of the narrative portion of Dr. Draper's work we cannot speak too highly. His sketch of the events which led to the war, and his summing up of the Northern and Southern sides of the controversy, are models of calm perspicuous, and judicial statements. He is evidently exceedingly fair-minded—a fact which renders his weakness in generalization all the more remarkable, as a man can hardly be fair-minded without considerable capacity for the collection, arrangement, and valuation of facts.

NOTES ON THE NEW EDITION OF WEBSTER'S DICTIONARY.

NO. XIX.

Church.—So far as the *form* is concerned, κυριακὴ (*sc.*) οἶκος, or κυριακόν, from which the editors of Webster derive the word, furnishes a satisfactory etymology for the A.-S. *cyric*, though the O. G. *chirihha* and *chilihha* do not so readily connect themselves with that root. That the Greek words in question were more or less used by Greek writers in the sense of *church* (edifice), for a long period during the Middle Ages, is certain, but they do not appear to have ever been the familiar, popular designations of buildings set apart for divine worship; and besides, we are constantly met by the difficulty of explaining how a word, comparatively rare in Greek itself, and unknown to Mœso-Gothic and Latin, should have made its way into all the Germanic dialects, at least as early as the eighth century, when Greek was scarcely known, except by name, to any of the Gothic tribes but the Mœso-Goths. We might conjecture, indeed, that the Væringjar brought home the word from Mikligarðr, but that would be an unsupported and improbable supposition, especially as we have no evidence that the Northmen visited Constantinople so early as the seventh or eighth century.

Circus, as those structures may often have furnished materials and sites for churches, or *circulus*, as descriptive of an early form of them, might be

accepted; but there is no evidence that they were ever used in M. L. to designate church edifices, or anything belonging to the clergy, though both were occasionally employed in the sense of audience or congregation, and it is improbable that the Gothic tribes would have agreed in choosing as a name for church a foreign word only remotely connected with such edifices.

It will hardly be doubted that all the Gothic names for *church* are the same word, and as there is no proof that any one of those tribes coined or borrowed the word and bestowed it on the others, they must all have taken it from some common and obvious source. Neither *κυριακόν, circus*, nor *circulus* fully satisfies the necessary conditions of fitness as a descriptive term, correspondence in form, and general accessibility to all the nations who resorted to the same root for the development of a naturalized name for *church*.

The ecclesiastical Latin *clerus* suggests a possible origin for the word in question, though in point of form, at first sight, less satisfactory than *circus* or *κυριακόν*, and I by no means propose this etymology with much confidence. But what was the popular, perhaps even the literary, pronunciation of *clerus* and its derivatives in the eighth century? At the earliest period in which we find any of these words in the Italian line, that is, in the dialects whose pronunciation would go far to control that of other Christian nations whatever the orthography of the word might be, the normal change of *cl* into *ch* or *chi*—as *clarus, chiaro; clavis, chiave* (confer L. *clavis*, A.-S. *cæge*); *clericus, cherico, chierico*—had already taken place. Wherever Christianity spread, it carried *clerus* and its derivatives with it, and if we suppose them to have been pronounced by the Romish missionaries in the seventh or eighth centuries as their progeny certainly were in the Italian popular speech two or three hundred years later, we have a root coextensive with Latin Christianity, and which might very readily assume all the forms in which *church* exists among the Gothic tribes. It should here be noticed, *en passant*, that in many Italian dialects *ch* has the same sound as in English, so that *chiesa* is pronounced as if written *ciesa*, or, in English orthography, *chaza, cherico, chierico*—and even the Latin *clericum*, if, as is probable, its initials had habitually the same sound as in Ital. *cherico*—would, therefore, where this pronunciation prevailed, have a considerable resemblance to *church*. In fact, *cherico* was sometimes written *cerco*, and doubtless pronounced accordingly—that is, giving the initial *c* the sound of English *ch*. (See Tommaseo, Diz. It.) Again, in some other dialects, *ch* is a guttural, and therefore approaches the O. G. *ch* in *chirihha*.

In the case of Ital. *chiaro, chiave*, and most other words where the initials *chi* correspond to the Latin *cl*, we are not able to affirm with certainty that the Italian words are derived *from* the Latin, because they may belong to a sister dialect or dialects as old as Latin itself, and which gave to these words the same articulation which belongs to them to-day. But *clerus, clericus*, and the like came into Latin with Christianity, and therefore *cherico, chierico* are certainly derived from that root through ecclesiastical Latin. The presumption is that, in passing from Latin into the popular speech, they carried the habitual Latin pronunciation with them, and therefore it is by no means improbable that the Roman ecclesiastics pronounced these Greek words much as their modern derivatives are now pronounced in most Italian dialects.

I am not prepared to show that *clericum*, or the like, was employed in M. L. in the precise sense of *church*; but a *church* is the place where the *clergy* perform their professional functions, and where they are at all hours to be found, as in their appropriate official residence; and it is not improbable that the church should have taken its designation from that of its occupants, as *monastery, monkery, nunnery* took theirs from the title of the *monks* and *nuns* who inhabited them.

In which of the Germanic dialects the word first appeared we are unable to say, but it occurs as an element in the name of a German village as early as A.D. 718, and it was currently used both in Anglo-Saxon and in several continental Germanic countries in the same century. The strongest, if not the only, direct evidence in favor of the Greek origin of the word is the testimony of Walafrid Strabo, a writer of the ninth century, who says that it was derived from the Greek *κυριακή*, or, as he writes it, *kyriaca*. The etymological opinions of Walafrid Strabo are by no means authoritative, but he may have had access to historical proof which we do not possess, and it must be admitted that his evidence is entitled to the weight, such as it is, which belongs to a not wholly improbable tradition.

The question, as connected with the history of the diffusion of Christianity among the Gothic races, is an important one, and will doubtless receive further elucidation. The reader will find an interesting though not exhaustive discussion of the subject in Grimm's [Hildebrand] Wörterbuch, under *Kirche*.

The etymology which I now suggest is, I believe, altogether new, and no doubt further research in mediæval Italian philology will bring out evidence either for or against it. At present, like the various other proposed derivations, it wants historial support; but to an ear familiar with Italian articulation, normal and provincial, it is recommended by at least a strong phonetic probability.

The Decisive Conflicts of the late Civil War, or Slaveholders' Rebellion. By J. Watts de Peyster, Brev. Major-Gen. N. Y. S. N. G., by Special Act or Concurrent Resolution N. Y. S. Legislature.—The author has vindicated his claim to his blushing honors by the publication of this pamphlet. That is to say, he has and he has n't. His two immensely long title-pages, garnished with many quotations in Latin and English, tell us he has, but they do not correspond with each other, and the contents of the pamphlet do not correspond with either. There are several chapters. The first is about pretty nearly everything. The second is said to contain, but does n't, an "Analytical Parallel and Criticism on the Principal Union and Rebel Generals," etc., etc., etc. The next two treat of Shiloh, and the last two of the Maryland battles of September, 1862. In matter and manner the pamphlet is equally valueless. It contains no new facts, no skilful use of facts that were known before, and no good reasoning or criticism. It is apparently the work of a man who has read a good deal without method, and without the power of digesting his information. The author's fitness for the discussion of military subjects, and his qualifications as a writer, may be judged from the following passages. On page 8, after speaking of Beauregard's failure to carry out the plans of Sydney Johnston at Shiloh, he says: "If susceptible of regret, to him is more applicable than to any other man in the rebel service the two finest lines of Whittier's exquisitely thoughtful 'Maud Muller':

> 'For of all sad words of tongue or pen,
> The saddest are these—It might have been.'''

The next quotation deserves especial praise for the bold and fine figure it contains, by the use of which Beauregard is represented as watering his horse in blasted hopes: "It was stated at the time that the capturer of Sumter had said in his address to the rebel army before the battle, 'I will water my horse in the Tennessee river or in h—ll before night.' The first he did not, the second he did, for what greater 'Inferno' to an ambitious military chief than blasted hopes and credit in his profession?"

Recent Republications.—We are afraid to draw an inference, except that the publishers have made money by it, from the fact that "Guy Livingstone," which now appears in the "Railway Library" of Messrs. George Routledge & Sons, has reached a sixth edition. But the worst influence that can be drawn from the gaudy cover of this volume—a ring-fight between "town" and "gown," or, as the author prefers, between "Proletarian" and "Patrician"—is not too bad for the real character of the hero. For those who may not have read the story, it may not be amiss to say that it is an attempt to extort admiration for a "thorough" blackleg, who is represented as irresistibly attractive even to the virtuous, though his face does not generally conceal his evil nature; feared and disliked, however, by the poor, destitute of all moral graces, and abounding only in brawn and animal magnetism, and who breaks his mother's heart and that of his betrothed, and, finally, his own spine, and is deplored by how many readers of both sexes who think they have assisted at the obsequies of something manly and chivalrous? So thought many a Southern young man and young maiden who worshipped, in this boxing, gambling, hunting, hard-drinking Don Juan, who "flinches no more before a great moral law than at a big fence," the spirit of aristocracy and the blood of the Normans. So thought the young people of many a respectable Northern neighborhood, and so may yet think the travelling clerks and others whose life is bound to the rail, as they peruse this sixth edition. But this is not only a bad book, but in a rhetorical point of view a weak and ridiculous book, full of rant and fustian and inflation, and in no respect redeeming by its style or its delineations the lowness of its aim.

Messrs. Ticknor & Fields send us "The Pickwick Papers" and "David Copperfield," of their "Library Edition" of Dickens—volumes bound in green, a little longer than the "Autograph" or "Charles Dickens Edition," and using larger and clearer type, of course with less economy of space, sometimes two volumes being required for one of the latter edition. In illustrations there is very little difference.

About two years ago (see THE NATION for Aug. 10, 1865) we reviewed Mr. Wm. Everett's book "On the Cam," which we are glad has been so favorably received as to warrant a second edition. This, we are informed in the introduction, differs from the first in the correction of a few errors in the text and of others in the appendix, and in a brief reply to one or two of the author's critics. Messrs. Sever & Francis never publish an ill-looking book, and they have made a handsome volume of these familiar lectures about Cambridge University, its ways, its studies, its great men, and its relations to Oxford and to England.

Some one has taken the trouble to collect and translate, and the Messrs. Appleton publish for him, "The Wit and Wisdom of Don Quixote," which, though here spread over in long and short, some 160 pages, has furnished us only four "familiar quotations," taking Mr. Bartlett as our authority. No one will object to doubling or quadrupling these, but most readers of this book will probably agree that the whole of the original is better than its parts—even its best parts. Gems of sentiment are generally dull reading, and act upon each other much like shades of the same color inaptly brought together.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

THE MAJORITY AND THE CONSTITUTION.

A CORRESPONDENT whose letter we print elsewhere expresses in a few words what is the difficulty of thousands of honest minds with regard to this dispute between Mr. Johnson and Congress—of men, too, who do not approve of Mr. Johnson's course, but who, nevertheless, cannot persuade themselves that he and the Supreme Court have not each as good a right to interpret the Constitution—that is, define the limits of their own powers—as Congress has. It is, however, quite plain to the commonest intelligence that whatever a written constitution can do, there is one thing it cannot do, and that is, prevent these co-ordinate branches of a government from coming into collision when each attempts to define its own powers. That these collisions have not occurred oftener, or rather have not proved of much moment hitherto, either here or in England, is due simply to the fact that in ordinary times the subjects on which co-ordinate departments differ and the ends they have in view are not of sufficient importance to tempt any one department into going to extremes. One is almost sure to give up before negotiation is exhausted. Therefore the arrangements made by a written constitution for preserving the balance of power may ordinarily work well. In this country they *have* worked well. Until the Dred Scott decision, although the powers claimed for the Supreme Court under the Constitution had excited jealousy and grumbling, there was no deliberate and avowed intention not to be bound by its decisions. But the Dred Scott decision touched a point which the majority felt to be vital, and at once the authority of the court as an interpreter was repudiated by the majority. So, also, the issues raised in this reconstruction process are felt by the majority to be vital, that is, to go to the very foundations of the national existence, and therefore the slightest attempt of the court to control the action of Congress would certainly be repudiated, and the court knows it and wisely abstains from meddling.

If the Supreme Court had the power of interpreting the Constitution under all circumstances and in all cases, the judges would govern the country as a small oligarchy, and reform would be hopeless inside half a century. You may assert that they have this power as much as you please, and the majority in quiet times may act as if they had it; but the minute troublous times come, and the majority is satisfied that if it obey the judges the ends for which the judges exist will be defeated, it will not obey them. To argue that this ought not to be so, is idle; you might as well argue that human nature ought to be changed. Perhaps it ought, but governments are made for men as they are and not as they ought to be, and the wit of man is not equal to the task of devising a written constitution which shall be obeyed under all circumstances. Nothing would secure this result but some occult power that would cause anybody who violated it instantly to drop down dead. In two-thirds of what is written on the sanctity of the "fundamental law," including the long disquisitions of Mr. G. T. Curtis in *The World*, there is a false bottom to the thinking. The reasoning is based on the assumption that the Constitution is the ultimate fact of our system of government. This is a delusion. The ultimate fact of this, as of all governments, is human nature; and until human nature is totally changed, the majority of a great and free country will not allow one man calling himself an executive, or nine men calling themselves a court, to interpret the fundamental law when, in the opinion of the majority, their interpretation would be dangerous to the public safety.

But this, says "Freedom," means a government of "mere majority, and leaves my breath dependent on their will." He is right. This is exactly what it means. We *do* live under a government of the majority. The Constitution is an instrument by which the majority binds itself to refrain from certain acts, but it never gives up its right, in the last resort, of explaining the sense in which it took the pledge, or, in other words, of taking the President or anybody else whom it finds running about and doing mischief, while professing to take "the Constitution for his guide," and putting him under lock and key, if it believes his hermeneutics dangerous to the state. The idea that there is something very horrible in being dependent on the majority of a Christian state for liberty and security, which "Freedom" seems to entertain, is the product of that species of fetish worship of which the Constitution has long been the object. The Constitution, unless it is a talisman, cannot have any more force than the majority gives it. If the majority desires to rob and cut throats, there is no virtue in the parchment to stop it. If it allows Andrew Johnson and the Supreme Court to define their own powers, it is simply because it does not consider it worth while to interfere with them.

This fact has always been so well understood by the highest class of minds that in constitutional countries the skill of great statesmen has nearly always been shown in avoiding reliance on the constitution, in persuading the majority into doing or not doing certain things without falling back on naked legal rights. As soon as a king, president, or minister says, in exciting times, that he will fall back on the constitution or charter, and act on his own construction of it, he shows himself as much a fool, and is as sure to be destroyed, as a single man who should point his rifle at a regiment. The end and use of statesmanship is to avoid bringing things to this pass. The minute the statesman appeals to force as against the majority, the majority measures its own strength against him and sweeps him aside.

This is just what Andrew Johnson seems disposed to do. He says his interpretation of the Constitution is the right one; Congress says its interpretation is the right one. Admitting one to be as likely to be right as the other, who is to decide between them? The Supreme Court is simply, when the destiny of a nation is at stake, nine elderly men. Suppose they throw themselves on Mr. Johnson's side, the result would be that ten elderly men would be of his way of thinking instead of one, because Congress does not regard the Court as any more competent intellectually to decide such questions as are raised in the reconstruction problem than Congress is itself. If the Court were more competent than Congress to decide such questions, it ought to govern the country completely, and the election and meeting of the legislature is a useless expense, so that in the last resort the dispute can only be ended by the majority using its superiority of force to decide—and this it is sure to do. This may be an unfortunate state of things, but nobody is to blame for it—neither the framers of the Constitution nor those who live under it. In every free state the maintenance of liberty and justice—no matter what the written forms may be—depends in the last resort on the character of the majority of the people. "Freedom" would be sure of his liberty in Philadelphia if the Constitution were abolished to-morrow; he would not be sure of his head or his purse if he lived in Mexico, though every man in the country wore the constitution in a locket round his neck as an amulet.

GENERAL BUTLER'S ETHICS.

GENERAL BUTLER has won a good deal of reputation as a lawyer and administrator, but nobody gave him credit for much ability as an ethical philosopher. To this title, however, he has fully vindicated his claim in a remarkable conversation reported in the Boston *Advertiser* of Sept. 4. He there laid it down that, as the United States five-twenty bonds are not on their face payable in gold, but only in "dollars," the Government ought only to pay them in paper currency, as it pays its other creditors. This, says the general, "is the exact letter of the bond." That is, as the bonds are a promise simply to pay so many "dollars," and do not mention what kind of dollars, and as the Government can call anything it pleases "dollars," by means of an act of Congress, it may fairly pay its bond creditors either in paper or old iron or cast-off army-blankets or damaged biscuit, or any other commodity that it may want to get rid of. To be sure, General Butler

recommends paper with promises to pay printed on it; but then, as this paper would, under such circumstances, be worth absolutely nothing, we take the liberty of amending this proposition and suggesting that they get condemned stores, of which there must be large quantities still on hand. "One Hundred Dollars," for instance, might be painted in big letters on old uniform coats, and when a bond of this nominal value was sent in for redemption, the blanket could be handed over the counter to the holder. Of course he would grumble, but we could tell him that we never said we would pay him in gold. "But I understood," he would reply, "that you would pay me in the current money of the world; if I had thought that by 'dollars' you meant anything you chose to call a dollar, I never would have lent you the money." Then we should laugh at him and "chaff" him pleasantly for his simplicity.

But not only, according to General Butler, are we not bound to pay the bonds in gold, by the letter of the law, but are not bound in morals to pay them in gold. This may seem a hard saying to simple minds; but nothing can be plainer. The foreign holders of the bonds bought them as a pure money-making transaction, and not with the view "of aiding us in our great struggle;" so, also, the native holders bought them at a tremendous discount, and with a view to profit, or, as General Butler terms it, "an eye to the proceeds." Now, to make a debt or other contract binding on the conscience, it must be based on affection. In old times it had to be based on a "valuable consideration;" but those hard, wicked old times have passed away, and nobody is now bound to pay what he owes unless his creditors can show that they trust him out of love, and from a desire to see him get on in the world. As very few creditors can prove anything of the kind, the legal recognition of General Butler's theory would release vast numbers of worthy men from very disagreeable burdens.

What is most encouraging and delightful about this whole conversation is the illustration it affords of the amount of wisdom and high morality the nation has to draw on whenever it finds itself in difficulties in the summer season, when its great men have retired to muse and hoe potatoes on their paternal acres. If the Democrats get up a repudiation cry in the West—and there begins to be some fear that the pill, as they present it, may prove attractive to the masses out there—all the Republicans have to do is to send down a reporter to General Butler, or the like of him, and in five minutes a bolus is produced, made not simply, like poor Pendleton's, of common low interest or convenience, but of principles of pure justice, and the Democrats have forthwith to hide their diminished heads. His scheme is really, as compared to General Butler's, not fit to be seen. He recommends repudiation, in a brutal, coarse way, as a pleasant thing to do; while the Eastern statesman shows that it would not only be pleasant but right. In fact, Mr. Pendleton proposes garrotting; while General Butler recommends the scientific and innocent "drop game" as a means of getting over our financial difficulties. As the "drop game" may not be familiar to all our readers, we may explain that it is a mode of raising money occasionally resorted to by gentlemen in New York who find their credit low in the regular market. They put a counter feitfifty-dollar bill in a pocket-book first, and drop it in front of some innocent-looking countryman whom they see coming, and just as he approaches them pretend to discover it and pick it up in his presence. They open it; find a fifty-dollar bill in it, are too honest to keep it, have no time to advertise it, as the cars are just going; and propose to the countryman that he should keep it, advertise it, and restore it to the owner, advancing the finder ten dollars, or thereabouts, in the meantime, out of the anticipated reward. This he does, and the finder goes off content. Now, in this case no cheat is practised on the countryman; nobody forces him to take a strange pocket-book with fifty dollars in it. He advances the ten dollars "with an eye to the proceeds;" the finder does not tell him the fifty-dollar bill is a good one; he runs his own risk and meets with his reward; nobody is to blame but himself. Under the New York law the perpetrator of the "game" is, we regret to say, punishable; but in these days of progress let us trust he will not long remain so. Two or three more "jumps forward," and the poor fellows will find their devices acknowledged by society as a fair mode of levying the tribute which simplicity owes to smartness.

HINTS FOR CONSTITUTION-MAKERS.

BY A JUDGE.

V.—The Legislature.

Of all the fallacies for the State of New York which have been suggested to the Constitutional Convention, the worst, I think, is that which is known as "the representation of minorities." I say "for the State of New York," because there may be communities where the will of the people is expressed without the aid of the political machinery which accompanies it in this State, and where the constitutional or popular election is not preceded by what is now legally as well as familiarly known as "the primary." "The representation of minorities" in such a political community as ours would mean nothing more or less than the representation of politicians, and the only practical result that would come from it would be that the primary would absolutely govern the popular election.

There is a body of men in this country termed politicians. Party management (vulgarly called "politics") is their trade and business. A hundred of these ordinarily are equal to several thousand intelligent voters; for they devote to the work of the election every working hour of the three hundred and sixty-five days in the year, while the intelligent voter gives to the election but a single hour of a single day. These men are not favorites; all the ills of the country and nearly all the evils of the age are attributed to them. They do not sway the destinies of the nation, but do sadly meddle with them; they do not control the action of the people, but do continually interfere with it. They constitute a small, unscrupulous, unpopular oligarchy, and there is nothing more dear to the popular heart than the cry that in this or that movement of the people "the politicians have been defeated."

It has been wildly supposed that by preventing the preponderance of one party over the other, and placing both equally in power, the evils of "politics" would be overcome. This principle, stretched to its utmost limit, was applied to the city of New York. Each party elected six supervisors, and the Republican minority was as strong in the board as the Democratic majority. The fanciful idea was indulged that a board made up entirely of politicians would be non-political. But these worthies were not long in learning the fact that when they had managed a little convention of a hundred and ten members they had controlled the one hundred thousand voters of the metropolis, and were as surely supervisors of the city and county of New York as that the election would come. And thus it is yearly seen that a great city cannot shake off this dozen of men, nor strike down any one of them, no matter how obnoxious he may have become. It is quite true that the people *might* nominate other persons, and *might* vote for them, and *might* elect them; but it is not the business of our Convention to frame a constitution for what might be, but for what has been and most inevitably will be again.

The next form of this is simply a modification of the original idea, and consists in electing two of the majority and one of the minority. It is an improvement, inasmuch as it gives the citizen a fraction of a choice and the privilege of saying which party shall have two and which but one; yet it is, nevertheless, only a variation of the pernicious principle that the "nominated" shall not be defeated.

A third form is the English project of allowing a voter to vote by one ticket for three men, or three times for one man, as he may see fit. But the only practical advantage from this would be that, on the day of our elections, tickets would unblushingly appear bearing the name of Michael O'Rourke three times repeated, and similar tickets bearing the name of Patrick McLaughlin three times repeated; while the friends of those most respectable gentlemen, Messrs. A., B., and C., would vote with such entire impartiality that (notwithstanding they were a clear majority of the district) Messrs. B. and C. would be defeated, and Messrs. O'Rourke and McLaughlin triumphantly elected. In other words, it is an ingenious scheme to enable a skilful minority to elect two candidates to a clear majority's one; and the only men who would profit by the scheme are the very men we are struggling to be rid of.

There is but one way in this State by which the people can secure themselves against bad candidates, and it is by voting them down. There is but one check upon the powers of party managers, and it is the power of voting them down; and the only provision which the constitution needs on this subject is a declaration which shall secure to the people the right of voting them down. All of these weak inventions are mere devices for "elections made easy." It is not "elections made easy" that we need, but elections made secure, whereby the bad may be stricken down and the real choice be taken from the managers of parties and kept sacredly vested in the people.

The principle that the choice of elective officers must be carefully preserved to the people, to be ascertained as exclusively as possible by the constitutional process of popular election, depends not only on the manner of choosing but on the districts which make the choice. Now, it is a fact, unobserved in this connection, that the smaller the district, the greater the certainty in the political result; that is to say, in most of the small assembly districts in this State the moment the convention of the dominant party has named the candidate, he may be considered as inevitably the next member. These petty conventions are

practically the appointing power, and the choice is not "the choice of the people," but the choice of the men who manage them. To understand this more thoroughly, it is only necessary to reflect that the change of a great district is not caused by the revolution of each elective precinct within it, but by a few votes in each changing from the one party to the other. Thus the State, which is the maximum district, has changed the oftenest. Under the present constitution it has changed, 1st, from Silas Wright to John Young; 2d, from Washington Hunt to Horatio Seymour; 3d, from Horatio Seymour to Orville H. Clark; 4th, from Edwin D. Morgan to Horatio Seymour; and 5th, from Horatio Seymour to the present incumbent. Therefore, in ten (biennial) elections this maximum district has changed five times, and the ratio of change is fifty per cent. Now, of the one hundred and twenty-eight assembly districts is there *one* which, through the same period, has changed in its (annual) elections ten times? The people of the State, therefore, possess a freedom of choice which is denied to every lesser district of which the State is composed, and the smaller the district, the more stringent is the denial of this right, and the more trammelled the free choice of popular election.

Under the former constitution of New York the thirty-two senators came from but eight districts, and the members of the lower house were chosen by counties. Yielding everything of theory to the theorists who brought in the present system, I must insist that it is not open to dispute that the *fact* of small districts was followed by the *fact* of small men. There was a time when the "politicians" in the large counties were compelled "to give weight to the ticket" by placing thereon an eminent lawyer, a prominent merchant, a great manufacturer, and these men thought it an honor to thus head their ticket, and when they went up to the Legislature they represented and acted for the law, the commerce, and the manufacturing interests of the State. There was a time when the citizens of Albany threw open their doors to the members of the Legislature and felt honored by their presence, and in turn added to the attraction and dignity of the office. That time certainly has passed away, and certainly it passed with the coming of the present constitution. Since then, few men of standing care to represent the paltry districts in which they may chance to dwell. They go to Albany, and receive neither attention nor hospitality. They return home and find that the nomination must go next time to another man, that anybody can be elected and that somebody else must have his turn, that it will not do to give the *office* all the time to one man. The year after, he finds that the *office* has been parcelled out to a third man who never held it before. The respectable citizens of the district say that Mr. A. represented the district most creditably, and was a most useful legislator for the State, and they wonder why he was not renominated; that he ought to have been. And thus, year after year, we find that of the one hundred and twenty-eight members over one hundred are new men, inexperienced, ignorant, worthless, easily led, easily bought, who have come up to the surface once and will never come again. Is there another intelligent community in the world that make their own laws with such folly?

I say "*easily bought.*" Such is the fact. As to the reason, there may be a difference of opinion; but the fact no one disputes. Of the two houses the Senate ought to be most easily bought, for it is the smaller, and thirty-two members ought to be more cheaply purchased than one hundred and twenty-eight. Corruption ought to be more general there, because, if a certain sum is to be invested in carrying a bill, the few will have larger shares than the many. Comparatively, a senator might command four times the price of a member of Assembly. We know (so far as such a fact can be known) that this is not so. We know that the small Senate is the less corrupt and the more trustworthy. What are the differences in the organism of the two houses? If we can ascertain these differences, is it not fair to presume that they affect the results? Reasoning like reasonable beings, may we not conclude, as in any other undertaking, that like causes will produce like effects, and that it is perfectly possible to make the Assembly as respectable as the Senate?

The first difference is that the senators represent districts four times as large as those of the members. They do not, as a rule, come to the surface for a single winter and then disappear. Their districts require of them reputation, and are too large to allow of the office being awarded to A. for the first year, to B. for the second, to C. for the third, etc., etc. A senator does not come there to mingle in a mob of men as ignorant and irresponsible as himself—to seize the only gain that can be gathered, conscious that he will never have the opportunity again. In one word, the larger districts produce the larger men.

The second difference is that the Senate is elected biennially. We Americans are a busy people, generally acknowledging that we have not time for anything. As one of them, I confess that I would rather have our elections held biennially. I could then give more time to them and take more interest in them, and do my work of citizenship better. When I ask my neighbors, they agree with me in the wish, and say that the elections "do come most too often now, and interfere too much with a man's business." Why cannot we have this as we wish it? Because there is a certain "political machinery" that would become rusty and useless if it were not oiled and used every year. Because there is a certain class of men whose trade is "politics," and they would be bereft of occupation if the election did not come once a year. Between the Convention and the Legislature the city of New York has a fair chance of having three elections *per annum*. They will divide the interest of respectable voters and lessen their attendance; but they will increase the trade in "politics." The men who live by that trade would prefer to have an election once a month. It is said that rare elections are animated, excited, bitter. I concede that they are. But those who thus object forget that they are so because the people are alive. Such elections are good for intelligence and integrity and patriotism. The elections which are fraught with danger are those which are "neither hot nor cold," when the people neither work, nor discuss, nor think, nor care.

The former Senate of this State not only had the twofold advantage of members chosen from large districts (one-eighth of the State) and for long terms (four years), but it also held an admirable principle of stability such as few elective bodies ever possessed. Though four senators represented a district, but one was elected in a single year. Hence the attention of the voter was centralized on his single candidate, and, no matter what might be the fluctuation of public opinion, but one-fourth of the Senate could be changed at one election. This was substantially the system of the United States Senate, and, like it, secured capable and experienced legislators. In a previous article I have pointed out the fact that the former Senate worthily rose to the dignity of a high judicial tribunal. Such it was when the Convention of 1846 swept it away. Cannot the Convention of 1867 restore to us such a senate as the other destroyed? The people of this State are more earnest, more independent, and much more intelligent now than they were then. Why must their representatives be worse?

After an active participation in the political work of the last fifteen years, after a careful review of the facts which our State constitutions have established, it is my deliberate conclusion that the Constitution of the United States contains the best framework of government ever constructed by the hand of man; and I think those State constitutions have proved to be the best which most closely resemble the Constitution of the United States. Two prominent characteristics of that instrument are, biennial instead of annual elections, and a stable Senate. The past and present experience of the State of New York only confirms the wisdom of the Constitution of the United States. There is no reason why we should depart from it or idly follow the windings of visionary men. The theories of government are endless and the projects of the visionary are plausible, but the facts of the past dictate to every State convention as the one approved and true pattern the Constitution of the United States.

"SWEETNESS AND LIGHT."

We print elsewhere "A Plea for the Uncultivated," from the pen of an avowed "Philistine," who has probably done as much credit to his group of the two into which Matthew Arnold has divided the human family as any other member of it. He makes one good point against Mr. Arnold in asking how, as long as the world is constituted as at present, most people can avoid being "Philistines." If the great mass of mankind, having to work hard in occupations which do not provide much culture for the mind and yet absorb all the attention, learned "to see things as they are" with as much facility as an Oxford professor, they would be more than human. Moreover, though our "Philistine" does not make this suggestion, Mr. Arnold has displayed in his latest, as indeed in all his sociological papers, considerable difficulty in "seeing things as they are" himself. He is bright, sharp, satirical, and wields a matchless style; but then the style very often covers considerable confusion in thought; and confusion in thought, in anybody who undertakes to call the attention of mankind to their shortcomings, is an unpardonable sin. It comes, we think, in him, as in Thomas Carlyle, from the fact that he has taken the position of fault-finder, but has absolutely declined all responsibility as to remedies, and has thus got rid of the great and only check which prevents the brain of the social reformer from going wool-gathering—to use a popular but very suggestive simile. When a man makes it the business of his life to point out defects in the social system by which he is surrounded, if he acknowledges at the same time his obligation to find a cure for each defect he discovers, and if society makes his finding the cure the condition of being listened to, he is forced into accuracy of thought, no matter what his natural tendency may be. He is compelled to combine the caution of the man in office with the aggressive vigor of the man out of office. The consciousness that he must follow up his exposure of a fault with a plan for remedying it, causes him to consider, in the first place, whether it is a fault or only a misfortune whether anybody, and if so, who, is to blame for it, and how the blame should be distributed; whether the root of it lies in the character or in the circumstances; what amount of effort, the character and circumstances being such as they are, it will take to get rid of it; and so on. No reformer can go through this mental process without weighing his words when he

comes to speak, without infusing into his denunciations some of the judge's justice as well as of the prophet's zeal. Coleridge tells of his having been once much annoyed by an old Jew passing his window and calling "O' clo', o' clo'!" He stopped him, and asked him sharply why he could not say "old clothes," as he did. "Sir," said the Jew, "if you had to cry 'old clothes' as many times a day as I have, you would cry 'o' clo'' yourself." The critic confessed he never felt more thoroughly rebuked in his life, and the reason was that he had not given himself the trouble to think, before finding fault with the Jew's pronunciation, what under the circumstances could be done to improve it.

Now, Matthew Arnold and Thomas Carlyle have both taken up the position of critics of society, pure and simple, and for persons of a certain temperament no task can be easier or more delightful. Society in every country is full of defects, defects both of form and substance, and to sit down and write scathing exposures of them and abuse everybody engaged in the work of the world, to call the coal-heavers beasts because they have coal-dust on their faces, the huckster a fool because he knows nothing of Plato, and the idle, donkeys because they object to being whipped into industry, is one of the most attractive occupations in which a man with a ready pen can engage. But if everybody who engaged in it was obliged to tell the coal-heaver how to keep the coal-dust off his face, and the huckster how to attend to his business and yet study Plato, and convince the idle by argument of the moral value of whipping, comparatively very few would engage in it. Thomas Carlyle's occupation would certainly be gone, and Matthew Arnold would, at least, have to change his method.

Take as an illustration of the looseness of much of Mr. Arnold's talk his comments in his last paper on the motto of the English *Nonconformist*, "*The Dissidence of Dissent and the Protestantism of the Protestant Religion.*" He takes it for granted that this furnishes the key to the English dissenter's philosophy, and that the aim of the dissenter's existence is to maintain the dissidence of dissent and the protestantism of the Protestant religion, and concludes, naturally enough from such a postulate, that there is not much "sweetness and light," or much immediate prospect of it, in the dissenter's life. But the fact is that the dissenter no more thinks of Dissent and Protestantism as *ends* than Mr. Arnold does himself. They are his means of doing what Mr. Arnold declares to be the end of culture, "making reason and the will of God prevail." The editor of *The Nonconformist* may desire "sweetness and light" just as much as Mr. Arnold, but he conceives the existence of an established Church in England and the propagandism of the Catholic Church to be great obstacles to the prevalence of "sweetness and light;" therefore he cherishes dissent as the instrument for the removal of the state Church, Protestantism as the bulwark against that particular form of spiritual tyranny called Catholicism, and reasonably enough he glorifies the essence of each of them as a valuable social agent.

Our "Philistine" has, however, not been content with defending his class; he has undertaken to carry the war into the enemy's camp, and here he has, we take leave to say, come to grief. Nobody by whose sayings men of culture would be willing to be bound has ever maintained that proficiency of Latin and Greek necessarily entitled a man to a place in the front rank in the world of culture. A great many people do consider the study of the classical languages a good means of securing flexibility and the habit of concentration in the mind, and these are certainly very important qualifications for anybody commencing any pursuit in life. Many more consider an acquaintance with ancient civilization through the classical literature to be a most invaluable preparation for the work of solving the political and social problems of this civilization of ours—an opinion in which we heartily concur. One of the greatest hindrances to human progress is the *narrowness* of men, and narrowness is generally the result of drawing one's experience of life from a limited portion of the earth's surface or a limited period of time. So that, while acquiring Greek and Latin may only give a man command over his own attention, acquaintance with classical history and literature gives him familiarity with a different civilization and a different order of ideas from those in which he has grown up, and the place of which no study of modern life, in no matter how many other countries, can thoroughly supply. Therefore, we do say that the "scholar," in the wide sense of the term, and not in the narrow sense in which "A Philistine" uses it, is better equipped, *other things being equal*, for dealing with even such problems as "What is a dollar?" than the "Philistine" is. But we say "other things being equal," because no amount of acquaintance with antiquity, and no amount of Greek and Latin, will make a feeble mind anything but feeble, or a thick skull anything but thick. That there is an occult virtue in "going to college" is a mediæval delusion.

We must not get angry with classical education because it does not do more than this to fit a man to deal with the social and economical problems of his day. Mathematical education does not even do as much. Of the two, the world owes rather less material or spiritual benefit to the latter than to the former. A young man may become a very thorough mathematician and yet be as much dumbfoundered by the Philistine's "dollar" as the classical scholar. Mathematical learning, although in its higher branches it requires, of course, prodigious intellectual exertion, consists mainly in an exercise of ingenuity—in so combining certain inductions as to make cases which confessedly fall within one, fall also within others. But in dealing with social and economical problems a large part of our difficulty lies in the selection of the facts on which we are to reason; and for the formation of the kind of judgment which is required in this process, general culture—that is, a wide range of knowledge, a familiarity with a variety of forms of society, as well as a highly disciplined mind—are necessary. It is not enough to be conversant with the machinery of "business," nor is it even necessary. In other words, the aim of "culture" is not so much to instruct a man in political economy, though political economy ought to form a part of every system of education, as to furnish him with a mind which, when applied to the economical problems, will handle them with ease and dexterity. Although a college or mere literary education, as it exists at present, may not be the best that can be devised by any means, we think we can show, even to the "Philistine's" satisfaction, that, such as it is, it has done more to fit men for sociological investigation than any other.

We presume he intends the question "What is a dollar?" to cover a knowledge of the laws which regulate the economical relations of men in civilized society. Now, "Philistines," as he himself defines the term, have had, from the earliest ages, far more to do with the *working* of economical laws than the "scholars." The "dollar" has been always in their hands, and on their proper understanding of these laws and of the functions of the dollar have always depended a large proportion of their success in life. Consequently, one would expect that they would have built up a science of social economy—that is, formulated the laws which regulate wages, labor, capital, currency, and exchange, and have furnished the world with a clear account of them. They have, however, done nothing of the kind. There is such a science, of comparatively recent origin, certainly, and still in a very imperfect state, but the "practical men" may be said to have contributed nothing to it whatever. If we run down the list of writers on economical science, from the earliest times to our own day, we find that they are almost without exception "scholars"—that is, men of literary training and not "practical" business men. Lord Bacon, Sir Joshua Child, Melon Forbonnais, Genovesi, Dr. Davenant, Sir William Petty, Hobbes, Locke, Hume, Sir James Stewart, Herbert, De Quesnay, Mirabeau, Turgot, Adam Smith, J. S. Mill, Malthus, and Senior were all "scholars." Mr. Ricardo, in England, was a banker, and made one important contribution to the science in his theory of rent; and Messrs. Cobden and Bright have been exceedingly able teachers of it, but did nothing to enlarge its boundaries. The ablest treatise on it in our day is from the pen of the man who at this moment is the ablest advocate of "culture," and one of the most brilliant examples of its advantages—J. S. Mill. The two ablest political financiers England has produced, the men who have most successfully dealt with the "dollar" problem, were Peel and Gladstone, both "scholars," both full of Greece and Rome. The two ablest political financiers this country has produced, Hamilton and Chase, have been lawyers and university men. In fact, in running over the history of the "dollar," it is singular to see how few traces of their existence "practical" men have left upon it.

The explanation of this phenomenon is easy enough. Political economy, like all other sciences, requires for the successful treatment of its problems not simply familiarity with the things with which it is concerned, but the mental capacity to grasp and apply, through complicated chains of reasoning and a great variety of phenomena, the law of their relations to man; and this comes through mental discipline and a wide general culture. Practical knowledge of trade is, of course, of immense value to a political economist, but unless he has the reasoning faculty and the power of concentration also highly cultivated, it will be of almost no value whatever. A curious illustration of this has been afforded in the case of Mr. Jay Cooke, of Philadelphia, who, having grown rich through selling enormous quantities of Government bonds, got it into his head that, having handled so many bonds, he must be an authority on the nature and functions of public credit, and undertook to demonstrate to a wondering world "that a national debt is a national blessing;" but the result was extremely ridiculous. Business men often have the observing and reasoning faculties, of course, in a high state of development naturally; but, as a general rule, the "scholars" have, and are entitled to, as much pre-eminence in the field of economical science as in that of mere literary taste.

ENGLAND.

LONDON, Aug. 23, 1867.

PARLIAMENT is prorogued, and the quiet season has irrevocably set in. The papers are ready to devote any quantity of space to topics which a fortnight ago could not have obtained admission to their columns. They are debating at full length the plans of the French Emperor, and exhausting themselves in conjectures as to the meaning of his meeting with the Emperor of Austria; they are investigating the causes which led to the death of a few (nobody knows how many) hundreds of thousands of English subjects by the Orissa famine; they have had half a dozen letters about a dead dog which has been lately moving up and down the Thames. And for a time no more lively incidents are likely to present themselves. You will, therefore, I hope, excuse me if I make a few concluding remarks upon the great achievement of the past session—the Reform bill. Its effects will for a year or two be subjects of speculation, as Mr. Disraeli allowed the House, by way of a trifling acknowledgment of their efforts, to put off their own execution till 1869. The means by which the result has been achieved have been sufficiently discussed at earlier stages of the proceeding. Mr. Disraeli has certainly surpassed the expectations of friends and foes. As a master of parliamentary tactics he has shown unrivalled powers. He has fairly trumped his adversaries' hands. He has yielded to all the popular demands, and yet made concession sound like triumph. He has dragged his staunch Tory partisans with him to ends which they denounced a year before as revolutionary; the few faithful Abdiels who protested, though men of weight and ability, have been left helplessly stranded; the opponents, whose measures he has adopted for his own, have been forced to allow him the credit of carrying them. In short, he has, in spite of all prophecy and of all opposition, performed a feat which no one could have anticipated, by an astonishing display of parliamentary skill. Has he shown himself to be a statesman as well as an acute partisan, or has he outwitted himself, as well as others, and laid the foundation of future ruin in a temporary triumph? Time must show; meanwhile I must also admit that his adversaries have not succeeded in increasing their reputation or escaping from the false position in which he placed them. Mr. Gladstone, who began the session well, committed many of his characteristic faults, and his enemies may still say with plausibility, if not with truth, that he is too impulsive and too quick-tempered to lead a party in Parliament. Mr. Bright has shown at intervals his unequalled eloquence and fire; but his tactics have certainly failed, and he allowed himself to be tempted, at least once, into an opposition, which appeared to be factious, to his own opinions when brought forward by an adversary. Mr. Mill has gained some triumphs, especially in the partial acceptance of his pet theory of the representation of minorities—I confess my own doubts as to its being a very promising scheme—but he, too, has shown the foibles to which an imperfect sympathy with the medium in which he is placed is occasionally too favorable; his audience gain the right, which they eagerly desire, to call him crotchety (the abusive equivalent to philosophical), because he puts forward his crotchets or philosophical tenets a little too eagerly and unequivocally for their taste. But whatever good or harm the passage of the bill may have done to individual reputations, one thing is clear: the resisting power to innovations has been strangely diminished. A bill which its adversaries have denounced, and one of them especially, Mr. Lowe, with no common power, as democratic and subversive, has been carried by a Tory minister, not in obedience to any strong pressure from without—and this is the most remarkable point—for the popular excitement was never comparable to that which forced the old Reform bill and the repeal of the corn-laws upon the country, but chiefly because people had become convinced that something must be done. I consider the passing of the bill to be the indication of a very widely-spread feeling that we have lately been dropping behind the age, that our institutions want a thorough overhauling, that vested interests have become too powerful, and that the only means of starting our rusty machinery with new impetus is to call in the aid of democratic energy. Representation of minorities is a pretty theory, and might be a desirable improvement in some other countries; but what we want is the representation of majorities or anything else that will prevent our constitutional machinery from becoming fairly clogged, covered with blue-mould, and in danger of decay from long-continued immobility. The feeling that something must be done has been increased by many circumstances lately; to mention only one, by the extreme feebleness that has lately marked our foreign policy, and the curious fatality, or, perhaps I should say, the perverse instinct, which leads our governing classes to take the retrograde side of every question, even when they understand nothing whatever about it. They sympathized with the South against the North, with Austria against Prussia, and with all the powers of darkness against a united Italy. If they could have carried the country with them they would long ago have succeeded in breaking our heads against some brick wall or other. I believe, indeed—as I hope most Englishmen believe—that this is a proof of a temporary unfitness of our institutions. They represent the feelings of a generation back. We are like a crustacean which has grown too big for its shell, and has to go through some unpleasant throes in casting it. When the process has been surmounted, I hope that we shall again rise to our old place, and show that the vitality of the country has not been seriously injured.

There is another view, of which the most forcible expression has been given by Mr. Carlyle. "Shooting Niagara, and After?" is the title of a paper in the August *Macmillan* which, I presume, all lovers of a curious literary flavor will have already studied. The perverseness and the spurts of irrelevant fury with which it is occasionally marked have induced most English papers to treat it simply with ridicule. They say, Pooh, nonsense! and there is an end of it; and I am half inclined to agree with them. Still, I doubt whether the poohpooh arguments can ever quite sum up the fitting reply to a man of genius, and I am more inclined to sympathize with *The Pall Mall Gazette*, which has translated Carlylese into English, pared off some of the eccentricities, and presented a very respectable residuum of argument which demands a serious answer. I think, indeed, that *The Gazette* has unconsciously altered the essence of his remarks in this process of distillation, and has made him the mouthpiece of ideas not his own. Carlyle, it says, is the most influential of modern English writers—a proposition from which I entirely dissent. Some fifteen or twenty years ago this was nearer the truth. University students then talked Carlylese naturally; every youth who wished to be a little ahead of his neighbors was a disciple of the mysterious Teufelsdroeckh; Carlyle, in short, was the prophet of the rising generation, of the advanced guard of the radical school. That has completely ceased to be the case. The idol of the rising generation is undoubtedly Mr. Mill, than whom a more complete contrast to Carlyle can hardly be conceived. Every young gentleman who wishes to be before his age—that is, every clever young man with a soul above boating and cricket—studies Mill on logic and political economy and liberty and representative government. They are the sacred books of the new sect; Carlyle has undergone the fate to which humorists are specially liable, of falling out of fashion; his path lies too far from the beaten track. Still, he is a great humorist, and a man of great imagination, and to that I conceive that both his merits and his defects are owing. Both are displayed in the essay in *Macmillan*, which is worth studying if only for the skill with which it arrays rather commonplace remarks in an original dress. Carlyle, I have often thought, should be compared in literature to Rembrandt in art. He has the same peculiar power of seeing events in an exaggerated chiaroscuro. The high lights are concentrated on certain points and the great mass left in obscurity. This is equally conspicuous in his treatment of events and of characters. In this essay he says: "What is the use of liberty? To the good man it is a blessing that he should develop his own character; but to the bad man it is a curse; he should be forced to do right and be thankful for the force." This would be quite true if the world were as Mr. Carlyle sees it; if there were a few heaven-born heroes with superhuman insight, and the rest of the world were purblind sinners creeping at their feet, and from ignorance as much as from vice continually plunging deeper into chaos and misery. But I don't quite agree in this view. I think the heroes have a good deal of earth in their composition, and the common men a good deal of heavenly light; I fancy that, on the whole, men are guided more by aspirations upwards than by their viler propensities, and that, consequently, it would never do to put whips into the hands of the heroes and let them drive the vile herd at their own free will. And I also admit that were it not for the existence of some virtue and some common sense in the masses, liberty would be as ridiculous as Mr. Carlyle represents it. It is to this same curious tendency of his imagination that many of Mr. Carlyle's mistakes in other matters are owing. He loves the picturesque with his whole soul—the one eminent figure standing erect and well brought out from the background—and, therefore, he talks the intolerable nonsense (I can call it by no other name), that he repeats from the "Iliad in a nutshell" about the American war. He refuses to see anything in slavery except "permanent servitude;" that is, an engagement for a life instead of a year, as though the other incidents of slavery were of no importance; and further declares that this question of length of engagement was the only thing settled by the war. This points to another weakness which is a natural corollary of the first. He has a distrust, or rather an utter abhorrence, of the scientific view of history. He thinks that all questions are to be settled by "insight," *i. e.*, by looking at things from a poetical or imaginative point of view and judging by the picturesqueness of their appearance. If they group well, if the

light and shade are properly arranged, all is right; but he never dreams of the necessity of checking his impressions by any correcting statistics or by any careful induction; he knows nothing of any theory of a gradual development of the human race, or of any weighing of the unseen social forces which are often the most important. History is to him a succession of kaleidoscopic pictures, not the gradual unrolling of a mighty scheme. Hence we find such extraordinary results as that in this essay he actually rests his hopes for England in our return to aristocracy. The English aristocrat is, he says, the politest man known, and therefore he falls down and begs him to come and save us. It wants something more than politeness or science (another cardinal virtue of theirs) to do this; it would require, amongst other things, that the world should roll back on its hinges; that old ties and sentiments that have been decaying for centuries should start into new life. To one who looks upon history as a shifting phantasmagoria of picturesque scenes, that is a possibility; to people who condescend to think and observe, it is as vain a fancy as that feudalism should revive, or that men should give up gunpowder and take to bows and arrows. If the laws of human nature should change, how nice it would be!

I see that I have diverged into what you will perhaps care little about, a criticism of Mr. Carlyle as a writer; and yet I know not why it should not be as interesting as the thrice-told story with which I started—the criticism of the Reform bill. I began with the intention of saying more at length that with which I must now conclude, that your readers will find in Mr. Carlyle's essay, after making allowance for the writer's eccentricities, a very powerful and valuable statement of a very general creed. He, with many other more temperate writers, thinks that we are beginning to shoot Niagara; and notwithstanding his mournful views of politics in general, even he sees some hope in the approaching break-up of many antiquated pieces of humbug and conventionality. His hope, indeed, points in a very strange direction when he fancies that the aristocracy will put together the new ship of state, to be pieced together from the fragments of the old one when the crash in the falls is over. But the concordance of this prophet of one extreme school with the opinions of many of the opposite persuasion is worth noting, and may lead to an appreciation of the true nature of the approaching change.

Correspondence.

A PLEA FOR THE UNCULTIVATED.

To the Editor of The Nation:

Sir: We have had much good writing of late on the subject of culture, and much disputation as to the comparative merits of classical and scientific studies, yet it remains for one of the uncultivated to ask the question, "What is the end you seek when you claim that culture is the highest aim to which we workers must aspire?"

Define your purpose—give us a scientific definition of your words. What is the culture for which you would have us all strive?

If we take the popular estimation, we should probably find that in the minds of the greater number of people men would be sorted into four classes:

1st. The scholars. In this class we should find placed the highest, those whose attainments are the furthest removed from present times and interests, the learned Grecians, the scholars who have sucked in Latin with their mothers' milk, who, having had placed before them the theory that the study of language is the best discipline of the mind, and having become great philologists, have therefore proved themselves the most able men.

2d. The men of science, the great astronomers, the engineers, the chemists; but as these men come somewhat nearer to our everyday needs—since by the aid of the astronomer we sail ships with safety, and ships carry more cargo—since by the aid of the engineers we build railroads, and railroads only carry pork and cotton and the like—since the chemist only teaches us to make soap and to dye calico—we cannot feel that they are free from the taint of material things: they are not lifted above the vulgar wants of what theologians stigmatize as this corrupt body, and therefore they deserve not to be considered men of pure culture.

3d. The men of affairs—merchants, manufacturers, tradesmen, and artisans—to whom a little culture may be possible in their leisure hours, but whose pursuits are not in harmony with it, whose aims are in their nature such as to preclude high culture, who are the mudsills of conventional society, and under whom come the

4th class. The great mass of workers, who are the mud, the common clay, upon whom conventional society may set its feet, but who cannot partake in the culture which is the chief good to be attained in life.

We, the uncultivated, the Philistines, as Matthew Arnold calls us, have become so accustomed to this classification that we accept it without a protest, and even though most of us are engaged in pursuits by which the hungry are fed more bountifully and the naked are clothed more warmly than they would have been had we not worked out our vocation, some of us, I say, accept our doom as Philistines, and look up to the man whose head is crammed with the knowledge of books, who has found in the study of language the best development of the mind, as a superior being resting on a higher plane.

Have we not a right to question the justice of this popular classification? We know that, except for our work, the culture of the scholar who despises our pursuits would be impracticable. The first requirement of scholarship, unless in the rare case of the man of genius, is leisure, and leisure is not possible except from the accumulation of capital. Some one must labor, some one must trade, in order that the surplus result of labor may take the form of capital, on the income or principal of which the scholar may live.

This accumulation of capital, this process of consolidating labor for future use, this trade, commerce, manufacturing, and the like, absolutely demands an absorption, a persistent application of the intellect and of the time to such an extent as to render high culture, according to the ordinary use of the term, practically impossible. We must work, we must be Philistines whether we will or not, else there can be no culture either for us or for our critics who abuse us.

We may have good manners, we may be polished men; but if culture consists in the development of the mind by its application to language, literature, science, or art, we can share in it to a very limited extent.

But let us see if the scholar or the man of high culture can meet all the requirements. If he has fully cultivated his mind he should be able to use it, to apply it in any direction. Let us try him.

Ask him what a dollar is and he can only tell you it is a coin. Its function, its power, the intricate yet simple laws which govern its use among men, are to him as Greek to the Philistine. Yet mistakes as to the nature of the dollar have ruined nations and almost stopped the march of civilization. Perhaps the historian can trace the ruin of a nation to a mistake in Greek, but to the Philistine such knowledge is not given.

I challenge the man of pure culture, whose aim is culture, who has made the development of his intellectual faculties the study of his life, and, absorbed in his books, has simply crammed his head with knowledge, none of which ever comes out to give "sweetness and light" to mankind. In what is his accumulation more worthy of praise than that of the avaricious man who accumulates capital? In one respect it is even less worthy of praise. The scholar must be supported by the labor of others; he consumes the capital which some one else has gathered; but the avaricious man who accumulates capital cannot, if he would, fail to benefit others. The accumulation of his capital comes from its use, and no one will pay for its use except for his own gain. The user supplements his own labor with the capital of the miser, increasing his own share while he pays interest or profit on the capital. The use of capital promotes the abundance of commodities.

In most cases your scholar or man of science will despise your question, "What is a dollar?" or profess, with some scorn, an utter inability to apply his mind to any such problem.

I question much whether any problem in philology or science or mathematics is a better exercise for the mind than are the problems which must be solved in trade, finance, and the collection of revenue.

These are the questions which treat of the relations of men to each other, in which mistakes may be of such fatal character as to neutralize every effort of the teacher or the preacher to elevate human nature.

Is it not time for the manufacturers, the merchants, the traders, and the artisans to assert their claim? to prove that any culture which does not include them is incomplete? to demand that sociology, social science, political economy, the science of wealth, or by whatever name you may call the investigation of the laws of human relations, shall be included in every scheme of education?

When this has been accomplished we may find merchants and traders and artisans no longer accepting their doom as Philistines, or weakly attempting to evade it by a smattering of literature or art, but claiming for themselves a position as high as that of others who now look down upon them; and claiming this position by virtue of a clear perception of the fact that by their work the abundance of things is increased, the comfort of humanity promoted, the leisure of the scholar made possible, and true culture, or, as it has been well defined by Arnold, sweetness and light, diffused among all, and not monopolized by a few.

"A Philistine."

MR. STANTON AND GENERAL GRANT.

To the Editor of The Nation:

Sir: I have just read your article on Mr. Stanton, and feel that I must thank you for it. You have, I assure you, but done justice to him. From the day he entered the War Office to the close, I have followed him with the best opportunities for observation, and I am sure the nation owes a debt it can never pay to him. As chairman of the Military Committee I was brought into intimate relations with Mr. Stanton. I saw him under all circumstances—in the hour of victory, in the day of disaster, and in these later times of anxiety and humiliation, and I can truly declare that he was an able, honest, and devoted statesman. Often rough in speech and act; sometimes hasty and of necessity unjust, he was yet ever earnest, passionately devoted to the country and to liberty. It has been my fortune to know many public men during the trials through which we have passed, but no one has impressed upon my mind more evidences of being actuated by a sense of duty to the country.

I know that he remained in office for the past two years to do what he could to save what the country had done. He felt that it was a hard lot to be distrusted by friends, and we often talked the matter over. Some months ago he said to me: "I will not resign; I will die in this room rather than leave my post of duty. I know I have done some good and prevented much evil, and our friends may see it when I am gone." He believed it was the duty of a public man, as well as a soldier, to sacrifice himself, if need be, for

the country. I honored and loved him for silently bearing the burden of office and reproach. He gave the highest evidence of patriotism and unselfishness in staying in Johnson's cabinet.

Grant knew that Mr. Stanton remained in office for the sake of the country; for he was present, only a few weeks ago, when Mr. Stanton spoke of these matters. They were friends, agreed in policy, and I am confident Grant is acting from the same high motives. If so, he is making a great sacrifice that should win our respect. If he is acting otherwise, for personal ends, he is false to opinions I know he entertained only a few weeks ago.

Yours truly, HENRY WILSON.

NATICK, Mass., Aug. 24, 1867.

CO-ORDINATE DEPARTMENTS.

TO THE EDITOR OF THE NATION:

SIR: In your issue of August 29 you say, in your first editorial, "The real value of the doctrine of the equality of the departments is twofold. The first is historical, that it freed, as we have said above, the legislature and the judiciary from the control of the executive, in which in past ages they had always been. To a superficial view the legislature appears the weakest of the three; its power is latent, but *it is there*, ready to be called into actual exercise; and he is either a very brave or a very foolish man who ventures in the light of historical experience to provoke it. The ignominious overthrow of the President by Congress is not, therefore, a political revolution, but the effect of a rapid development of the natural tendencies of the Constitution." I think the meaning of your whole article might be condensed into the following statement: "Formerly the executive was despotic; our Government made the legislature coequal; but it should simply have transferred this despotic power from the President to Congress, and as this was not done before, it had better be done now; for this is only 'a rapid development of the natural tendencies of the Constitution.'"

This view strikes a deadly blow at a written constitution, because, as Congress represents the fluctuations of public opinion more rapidly than the President or the Supreme Court, it is thereby entitled to rule them both. If Congress should not only pass upon the extent of its own power, but designate the particular officer to execute its own laws, what then? The absolute rights of every one would be in the control of the majority, and we would instantly have to adopt the plan now accepted in England, and give the minority representation. This minority would either limit the power of the majority, or it would not. If it *would*, we would still have a constitution, but one uncertain and precarious. If it would *not*, then the majority could justly pass upon my right to breathe.

Is not a written constitution in which the extent of government [is clearly defined], and a body of judges [appointed] to pass upon that extent, better than this? That the day may come when every man will be a law unto himself I trust and believe; but "why were laws made, but that we 're rogues by nature?" and until we cease so to be, a written constitution, with its three departments, each supreme in its own sphere, will be the hope, the only hope, of FREEDOM.

PHILADELPHIA, Sept. 5, 1867.

G. P. PUTNAM & SON'S
NEW PUBLICATIONS,

IN PRESS, OR JUST READY FOR THE AUTUMN SEASON, 1867–8.

The Great Book on American Art and Artists.

THE BOOK OF THE ARTISTS; American Artist Life. By HENRY T. TUCKERMAN. Comprising Biographical and Critical Sketches of American Artists; preceded by an Historical Account of the Rise and Progress of Art in America. With an Appendix containing an account of Notable Pictures and Private Collections; with a fine Portrait on steel of D. Huntington, Pres. N. A. D. In one volume large octavo, about 600 pages, cloth extra, gilt top, price $5.

*** This work will comprise a large amount of interesting information covering the whole field of American Art; attractive, if not indispensable, not only to Artists, Amateurs, and Collectors of Paintings, but to every intelligent reader.

N.B.—A few copies will be printed on LARGE-PAPER for extra illustration. Price $12 to subscribers only. Twenty-five copies will be printed in quarto, with extra photographs. Price $30. Early application necessary to secure copies of either of these editions. *Expected to be ready in September.*

A PORTFOLIO OF PHOTOGRAPHIC PORTRAITS OF ARTISTS IN THEIR STUDIOS. Royal 8vo. The same in quarto, to match the large-paper copies of "The Book of Artists."

A New Work of Art for Presentation.

THE LEGENDE OF ST. GWENDOLINE: With eight beautiful Photographs from original Drawings made expressly for this work by J. W. ENNINGER. Quarto, cloth extra, $10; morocco extra, $15.

American Landscape Painters.

THE LANDSCAPE BOOK: By American Artists and American Authors. Comprising 16 fine engravings on steel from original paintings by Durand, Church, Cole, Kensett, Cropsey. Letterpress by Bryant, Bayard Taylor, Tuckerman, Hillard, Street, etc. Small folio, cloth extra, $8; morocco extra, $12.

PORTIA: and other Tales illustrative of the Early Days of Shakespeare's Heroines. By Mrs. COWDEN CLARKE. With four engravings on steel. 12mo, cloth extra, $3; gilt edges, $3 50.

THE GHOST. A Christmas Story. By W. D. O'CONNOR. With illustrations by THOS. NAST. 16mo.

IMPORTANT BOOKS OF REFERENCE.

G. P. PUTNAM & SONS will also publish in September,

HAYDN'S DICTIONARY OF DATES, relating to all Ages and Nations; for Universal Reference. The new (English) Edition, by BENJAMIN VINCENT. To which is added an American Supplement, containing about 200 additional pages, including American Topics and a Copious Biographical Index. By G. P. PUTNAM, A.M. In one very large volume of more than 1,000 pages. Price $8 50; half calf, $10 50.

*** This is the most comprehensive and reliable book of reference in this department ever published. The last English edition of the original work is given entire, together with American additions which were essential to the *completeness* of a volume which is marvellous for its fulness and accuracy. No good library can dispense with this volume. The English edition heretofore imported by Messrs. Appleton will, by special arrangement, be hereafter published by Putnam & Son with the American Supplement.

THE AMERICAN SUPPLEMENT TO HAYDN'S DICTIONARY OF DATES. Including a Copious Biographical Index. By G. P. PUTNAM. 8vo, $1 50.

A New and Thoroughly Revised Edition of 1867.

THE WORLD'S PROGRESS: A Manual of Dates connected with the History of every Age and Nation, and the Progress of Society in Knowledge and the Arts. Both alphabetically and synchronistically arranged; continued to August, 1867. With a colored chart. Designed for the counting-room, for teachers, students, and for universal reference. By G. P. PUTNAM, A.M. In one vol. large 12mo, cloth, $3 50; half calf, $5.

*** More than 10,000 copies of this Manual have been sold.

HUMAN LIFE: Its Duration, Conditions, and Limitation. By W. SWEETZER, M.D. 12mo, cloth, $1 50. *In Sept.*

GREECE AND ITS RESOURCES. By the Greek Minister to the United States. 8vo, paper, 75 cents. *In Sept.*

The Monthly "KNICKERBOCKER" Edition of IRVING'S WORKS. To be issued in 28 monthly volumes, beginning with October 1, 1857. *See Prospectus.*

ABOUT BABIES; GOOD-LOOKING PEOPLE, and other Social Essays. 16mo, cloth, $1. *Now ready.*

TRAVELLERS' NOTES, in both Hemispheres and Elsewhere. 16mo, cloth, $1.

"FOUND AND LOST," and other Maga Stories. 16mo, cloth, $1. (*Ready.*)

"WHAT IS FREE TRADE?" By EMILE WALTER. 12mo, $1. (*Ready.*)

"E PLURIBUS UNUM;" or, American Nationality. 12mo, $1. (*Ready.*)

Important Works Published for Subscribers.

GEN. GREENE'S LIFE AND WRITINGS. By his Grandson, Prof. GEO. W. GREENE. In three vols. 8vo.

*** Volume I. will be issued about the 15th of November.

THE LIFE, SPEECHES, AND CORRESPONDENCE OF HON. DANIEL S. DICKINSON, late Senator of the U. S. from New York, etc. Edited by his brother, Hon. JOHN R. DICKINSON. 2 vols. 8vo, with photographic portrait, price $10. *In October.*

JUST PUBLISHED.

UNDER TWO FLAGS. By "OUIDA," Author of "Idalia," "Strathmore," "Chandos," "Granville de Vigne," etc. 12mo, cloth, price $2.

ANGELIC PHILOSOPHY OF THE DIVINE LOVE AND WISDOM. By EMANUEL SWEDENBORG. From the original Latin, as edited by Dr. J. F. I. TAFEL. Translated by R. N. FOSTER. One vol. demi 8vo, cloth extra, price $2.

MISSOURI AS IT IS IN 1867. An Illustrated Historical Gazetteer of Missouri, embracing the Geography, History, Resources, and Prospects; the Mineralogical and Agricultural Wealth and Advantages; the Population, Business Statistics, Public Institutions, etc., of each county in the State. Illustrated with numerous original engravings. By NATHAN H. PARKER, author of "Iowa as it is," etc., etc. Complete in one volume royal 8vo, cloth, price $3 50.

A MANUAL OF MARINE INSURANCE. By MANLEY HOPKINS, author of "A Hand-book of Average," etc., etc. One vol. royal 8vo, printed on superfine paper, cloth, price $5.

IN PREPARATION:

FIGHTING THE FLAMES. A Tale of the London Fire Brigade. By R. M. BALLANTYNE, author of "The Wild Man of the West," "The Coral Islands," "The Red Eric," etc. With illustrations.

DEVEREUX. A Tale. By Sir EDWARD BULWER LYTTON. The Globe Edition. Complete in one vol. 16mo. With frontispice. Tinted paper, green morocco cloth.

THE STORY OF WALDEMAR KRONE'S YOUTH. By H. F. EWALD.

For sale by Booksellers generally, or will be sent by mail, post-paid, on receipt of price by

J. B. LIPPINCOTT & CO.,

PUBLISHERS,

Philadelphia.

PARIS EXPOSITION, 1867.

The Week.

THERE is no further news of importance from Washington. Mr. Johnson, it is said, understands his amnesty proclamation as restoring to the persons covered by it all their rights, civil and political, just as if there had been no rebellion, all acts of Congress to the contrary notwithstanding, but says the question of their right to the suffrage must be settled by the courts. With that he has nothing to do. It is rumored, moreover, that he intends to give not an order but a strong "hint" to the military commanders to keep the registration open beyond the date prescribed by the law, but even if this be true there is, of course, no probability that any such hint would receive attention. It may serve to give some idea of Mr. Johnson's state of mind to mention that he ascribes the outrage recently committed by Colonel Gilbert's soldiers in Arkansas to "Radical teachings." The soldiers sacked a printing-office because a newspaper printed in it had libelled them, and they did so, it appears, with the approval of their commanding officer, who is now under trial by court-martial for it, and the charge against him is based on his violation of the express provisions of the Radical Reconstruction act. But then Mr. Johnson may be right after all, for there is hardly anything the Radicals have not done, or caused or permitted to be done. Did they not provoke the South into insurrection, and did they not cause the New Orleans massacre? We some time ago drew the attention of *The World*, which is singularly acute in the detection of their connection with great crimes, catastrophes, and calamities, to the coincidence of the terribly severe weather last winter with the Radical ascendancy in Washington, in the hope that it would state the law of the relation of the Radicals to the climate, but we have had no response.

General Butler has sent to *The Evening Post* an explanation of his conversation with the reporter of the Boston *Advertiser*, touching the payment of five-twenty bonds, but it is not much of an explanation after all. He says that his scheme differs from Mr. Pendleton's inasmuch as Mr. Pendleton proposes to issue fresh greenbacks to pay off the bonds, while he only proposes to use for this purpose the greenbacks now in existence. This correction made, all we said on this matter last week stands good, and the project has been received by the Republican press with such unmistakable manifestations of disgust that it seems almost a waste of labor to say anything more about it. It may be well to add, however, that Mr. Hooper stated expressly in the House that these bonds were to be payable in gold, and such has since been the understanding of the country and the world—and especially of the widows and orphans who have put their money into them. The reason why it was expressly stipulated that the interest should be payable in coin was that the interest began to run immediately, paper being a legal tender, while the general expectation was and is that before the principal fell due gold and silver would be the only legal tender. Therefore General Butler's attempt to draw the inference that the existence of an express stipulation in one case excluded the supposition that there was any understood stipulation in the other, to say nothing of his other ingenious suggestions, was an unworthy attempt to apply to the decision of a great question of national honor and obligation expedients drawn from what Burke calls the "petty warfare of village vexation." It does one good, however, to see the leading Republican organ, the New York *Tribune*, smash the theory with a few blows of manly and honest logic. "What did we agree to do?" and not "What will it be easy or convenient for us to do?" is the question which a great nation has to ask itself in all matters of obligation, and it is the only question which anybody making any pretence to the character of a statesman should ever suggest to it.

The career of the personage who now styles himself "Acting Attorney-General," or as he is known in the newspapers, "Binckley," *tout court*, is one which is rarely met with in the Western world. His rise resembles the rise of a grand vizier at an Oriental court rather than that of a Christian lawyer, and it forms, perhaps, the most singular incident of Mr. Johnson's singular administration. "Binckley" is a jack-of-all-trades, who has been everything by turns and nothing long. According to an account given of him by the Washington correspondent of the Boston *Advertiser*, after having first made his appearance in Washington as a portrait painter, and then tried land agency, writing for newspapers, a clerkship in a Government office, and other shifts, he turned his mind to the law about three years ago, has had one case in court, which he judiciously withdrew, and then suddenly emerged as "Acting Attorney-General" of the United States, having been selected by Mr. Johnson as legal adviser of the Executive of the United States during a most critical period. We doubt if a parallel for this can be found in the history of any civilized state. "Binckley," too, has actually been permitted to "advise" the President in the Sickles case; that is, to furnish Mr. Johnson with legal reasons for arraying himself in hostility to Congress and the majority of the people, and the opinion was what might have been expected from a jurist of Binckley's standing.

Harper's Weekly calls attention to one question on which the policy of the extreme Radicals in the House and Senate has certainly been justified by events, and that is the question of adjournment. Mr. Sumner, Mr. Stevens, and others urged earnestly the maintenance of the session through the summer as a check on Mr. Johnson, but their Conservative

colleagues—from, as it now appears, over-confidence in Mr. Johnson's honesty—overruled them. The prolongation of the session certainly did not necessarily involve impeachment, while it would have most probably held the President in terror, or, at all events, have furnished the means of repressing him at any moment. But then the Conservatives were not, in regard to this any more than in regard to the impeachment, wholly wrong. There were dangers in a protracted session of Congress which were almost if not quite as appalling to a large body of the people as the possibility of Mr. Johnson's doing what he has done. Business was in a very depressed state, and there was not the least hope or prospect of its rallying as long as Congress remained in session with no real business before it, owing to the fear of its tinkering the tariff and the currency. It was well known that there was a powerful lobby trying to force it into doing one or other, or both, of these things, and plenty of other mischief besides, and business men were justly terrified by the prospect. We may add that unless Mr. Johnson should accomplish a greater amount of evil than he has yet done, we shall not feel at all sure that the Conservatives were not right after all.

The testimony as to General Grant's sympathy with Congress, and thorough understanding of his position and of the expectations and desires of the public, increases every day. The Boston *Commonwealth* reports an interesting conversation on this subject with Mr. Washburne, of Illinois, a warm and intimate friend of Grant, which goes to show that Grant took the secretaryship after a full understanding with Mr. Stanton, that he is fully alive to the perils and difficulties of the crisis, and that he earnestly urged the Conservatives of the Senate to retain in the bill the power of dismissing district commanders which the House had bestowed on him, fearing what has since occurred, or, as *The Commonwealth* has it, "transpired"—a word which is coming more and more into use amongst the reporters for grand occasions. Great state events "transpire;" common events happen. For instance, things "transpire" in "residences;" in houses they occur or come to pass. Differences between Mr. Johnson and Mr. Grant "transpire," while a fight between two hodmen would only occur.

The Lynchburg (Va.) *Republican* discovers in our assertion that the Supreme Court is simply, "when the destinies of the nation are at stake, nine elderly men," an "evidence of the lawlessness and demoralized spirit of the times." Now, nobody believes that the Supreme Court *is* anything more than "nine elderly men" when its decisions are opposed to the opinions of the majority on a matter which the majority considers to be of vital importance. The Dred Scott decision, for instance, was treated precisely as if any nine men in the country had uttered it. Nothing will, under such circumstances, ever make the Court anything more than this except the power of working miracles. If it can throw those who doubt its authority into convulsions, it will always be obeyed; but if it can only pronounce them guilty of a "contempt," it sometimes will not be obeyed. We regret this just as we regret the absence of a guiding and universally recognized authority in religious matters, but we are no more responsible for it than we are for the existence of the seventy-four sects of Christendom. "Freedom" has sent us another shriek from Philadelphia, in which he too seems to hold that unless we admit, against the evidence of our senses, that nobody ever can or will dispute the authority of the Court, we are somehow helping to break down the Constitution. We wish some of these sages would think a little more, and weep and wail a little less.

The leading topics of discussion in the European papers are the intentions of the Emperor of the French, as indicated by his speeches on his return from Salzburg. The interpretations put upon them of course vary, but the general result is profound uneasiness, producing on the Continent, and particularly in Paris, a complete stagnation of business, and loading the banks with unemployed capital. His admission that there are "dark spots" in the sky is taken to be a confession of faults which an autocrat would hardly be likely to make unless he were bent on atoning for them by a grand blow. An interesting article in the London *Economist*, on the timidity of French bankers and merchants, and the pettiness of their operations as compared with those of Englishmen or Americans, points how largely it is due to political anxiety. When an Englishman twits a Paris banker on his caution, he replies that there are no revolutions in England; in France there are—he has seen them, and knows what they mean. All this is an excellent illustration of the weakness of Cæsarism as a system of government for the commercial and highly complex civilization of the modern world. In a democracy, the publicity of the governmental process enables people to perceive tendencies, and form a tolerably good estimate of what is going to happen, and they can make their arrangements accordingly. If there is a warlike feeling abroad, they may safely calculate on war; if there is a general leaning towards peace, they may calculate on peace; but when peace and war are arranged by one man in his closet, for reasons of which the public knows nothing, safe commercial operations on a great scale are impossible. The imperial system is, in fact, very well adapted to simple societies like that of ancient Rome or modern Russia; but it is impossible for it to sustain itself as a permanency amongst the more highly civilized nations of our day.

The Austrian treasury, as we pointed out a fortnight ago, is in a bad way, and, as the empire is not strong in financiers, it has been trying to borrow a Dutchman, M. Van Bosse, formerly Minister of Finance in Holland, to infuse order into the chaos. But he is not to be caught, and the Kaiser is forced to content himself with the advice simply of another Dutchman, M. Wevering. The problem to be solved is how to pay debts without money, and M. Wevering's solution is simple and efficacious. He says they cannot be paid; that the Austrian creditors must suffer some loss; and that, after this, some improvement in the financial condition may be effected, but only very slowly. We hope that Francis Joseph, before he adopts M. Wevering's plan, will try what we can do for him in this country. If he will only leave the selection in our hands, we will furnish him, not with one, but with two or three American gentlemen who will put him in the way of saving his credit with hardly any outlay. We shall not name them at present; but we may say that they are in possession of a little machine, by the aid of which they undertake to discharge government obligations at the rate of millions an hour, whether bonds, notes, bills, or debentures, without any compromise or reduction. It makes no difference, too, in which species of money the debt may have been contracted. They can supply either florins or ducats or pounds or dollars with equal facility. This is no humbug. We advise all embarrassed governments to give them a trial.

Mr. Acland, who is well known in England as an "electoral agent," has been preparing statistics with the view of showing what will be the nature and effect of the changes made by the Reform bill. His first table shows that in forty-one boroughs the number of householders rated under four pounds exceeds that of the old ten-pound householders by majorities ranging from fifteen up to twenty-four hundred. If this indicated what it seems to indicate, of course we should be warranted in concluding that the act would completely and at once change the character of the House of Commons. But as we pointed out when discussing the effect of the new measure some weeks ago, a large number of the smaller boroughs are inhabited by agricultural laborers and small shopkeepers who are completely under the influence of the neighboring gentry. Twenty-seven of the above forty-one are of this class—the four-pound householders in them being nearly all agricultural laborers, brutally ignorant, and described by Lord Malmesbury, when speculating in the House of Lords on their probable political action, as "knowing at least the name of the sovereign if they did not know that of the clergyman of the parish"—a circumstance from which he seemed to derive a good deal of consolation. In boroughs of this class it is safe to say the Tory influence has been strengthened rather than diminished by the act. The great landholders are as sure of their votes as they are of the daily appearance of the voters to work on their estates.

The Reform League is now agitating for manhood suffrage, but we venture to assert that unless the further extension of the suffrage is accompanied by a system of thorough popular education, it would—English society being constituted as it is, and English land distributed as it is—only strengthen the hands of the class it is intended to overthrow, and strengthen it by a great increase of corruption and intimidation.

A striking illlustration of the value of the "dissidence of dissent and the Protestantism of the Protestant religion"—the Nonconformist devotion to which, in England, has so disgusted Matthew Arnold—has been afforded by a recent incident in Northamptonshire, in which a Mr. Smeeton, a tenant farmer, has been turned out of his farm by Mr. Villiers—a brother of the Earl of Clarendon—because, being a Dissenter, he refused to pay church rates, although he had cheerfully contrbuted to a fund raised for the restoration of the parish church. Mr. Smeeton says another landlord refused a farm to his (Smeeton's) father simply because he was a Dissenter; and he knew of a case in his own village where a little girl had been turned out of the parish school, built partly with the public money, because her Baptist parents did not choose to have her "christened." The English Nonconformists may therefore fairly oppose church establishments and Catholicism with all their might without laying themselves open to the charge of thereby throwing obstacles in the way either "of reason and the will of God" or of "sweetness and light."

The last number of the *Revue des Deux Mondes* contains an elaborate review of some of the manufactured products exhibited at the Great Exposition. The following with reference to the cotton manufactures of France is worth citing, in view of the discussion which is now beginning to rage here:

"The commercial treaties with England date from 1860 to 1861. The first movement of our industrial interests was, as every one remembers, to take the alarm, and, above all others, the cotton manufacture believed itself doomed. It thought itself so vulnerable on ever so many points—the price of coal, of iron, of machinery, of the elements or instruments of its labor, the interest on capital, the perfection of the workmanship and the extent of the markets. To expose it to such a shock was to ask it to rejoice over its own ruin; it would, at least, have been prudent to have waited till it was better prepared. Time has passed over these griefs, and shown how little foundation they had. . . . . Far from sinking under the experiment, our cotton manufacture has gained by it. England, it is true, has lost none of her advantages—the low price of coal and great power of exchange; but we have real compensation in the greater cheapness of labor and in the salutary stimulus given to the threatened establishments by the necessity of defending themselves. It is but justice to confess that to the complaints of the first moment have succeeded the manliest and most sustained efforts. . . . Until then many spinning-mills, enervated by protection, had lived on in a small way with defective machinery; this machinery has been completely renewed. In other cases, the work was carried on on too small a scale, and consequently languished. In every direction now the average of the operations has been raised to such a point that the smallest establishments do good service."

We quote the above as the testimony of a distinguished Frenchman, M. Reybaud, in the leading French review, and as a matter of considerable economical interest; because France furnishes what Bacon calls a "prerogative instance" in this controversy—her case being that of a nation, protectionist in opinion and feeling and traditions, which has had free trade forced upon her unjustifiably, as we have always thought, by an absolute monarch.

The Tribune's "special despatch" from Constantinople, ten days ago—announcing the presentation of an "ultimatum" to the Porte by the Russian ambassador, and demanding the cession of Candia to Greece and the equality of the Christians, gave that journal "the satisfaction of being the first to announce a movement, on the part of Russia, which probably assures the speedy dissolution of the Turkish empire, and may be the signal of a general European war"—turns out, as we predicted last week, to be just three-fourths fiction. The Constantinople correspondent furnished us on Wednesday morning with a full proof of his wildness and excitability. The "ultimatum" is neither more nor less than an elaborate plan of reform, drawn from the Russian Government by a visit of Fuad Pasha to the Czar, and by a personal request for advice addressed to General Ignatief by the Sultan himself, "*recommending*" the cession of Candia to Greece, and "*proposing*" certain internal reforms. The only pretext for calling it an "ultimatum" is General Ignatief's saying that if this advice was not taken, his master "would not be responsible for the consequences." The correspondent then unblushingly adds: "I do not think Russia is ready to follow up this ultimatum now; but it is evident she is preparing to strike as soon as war breaks *out in Europe*." Our advice to *The Tribune* is to instruct this gentleman in the meaning of "ultimatum," and to add to his "special despatches" a caution to the public.

Mrs. Theresa Longworth Yelverton, who has figured so prominently before the courts of Great Britain, in her attempts to establish the validity of her marriage with Major Yelverton, is now in this country seeking to raise money, by giving readings, to enable her to prosecute her suit still further. A paragraph in the New York *Tribune*, written evidently with the praiseworthy view of securing sympathy for her, gives a very incorrect version of her husband's position. He was forced to resign his commission in the army, it is true; but not "because he was living with another woman not his wife," as *The Tribune* asserts. This is not "an offence against morality and decency for which men are dismissed from the British army, as being unfit to associate with gentlemen," as *The Tribune* thinks. If it were, the British army would be summarily deprived of a great many valuable officers. What Major Yelverton was dismissed for was his having, on his own confession, gone through a marriage ceremony in Ireland, which he did not believe to be legally binding, for the purpose of betraying her, and for divers other frauds and falsehoods thereanent. Moreover, the legality of Mrs. Yelverton's marriage in Ireland has, we believe, received no confirmation beyond the verdict of a jury in Dublin in an action brought by a third party against Major Yelverton for his wife's maintenance, and the jury were unquestionably guided far more by their feeling of the major's rascality than by any opinion as to the validity of the marriage. The question turned upon the point whether Major Yelverton was or was not a Catholic at the time of the marriage, and on this the evidence in his favor was impregnable, although it was equally clear that at the marriage he had lied on this very point. We wish Mrs. Yelverton every success; but she will hardly desire herself that her position or that of Mr. Yelverton should be misstated.

A remarkable illustration of the economical ignorance of the working-men has recently occurred in England. A man has invented a machine which saves one-third of the labor of paper-hanging, and tried to show it to one of the leading firms in London, but could not get access to the head of the firm for a long time owing to the hostility of the men. When he sent in his card it was never delivered, and he was told the person he wanted to see was out. When he did at last see him, his machine was refused through fear of the men. The inventor was next civilly invited by some workmen to show them the machine, which he did in the innocence of his heart, but got a black eye and a good deal of abuse for his pains. He left the machine on trial at another shop, and it was smashed. In this matter of machines a very little reflection, or, in place of reflection, a very little knowledge, would show that a manufacturer who secures a machine which saves one-third of the hand labor, does not necessarily forthwith reduce his force by one-third. He has the same amount of capital to employ as ever, and the result is that he employs the same amount of labor but accomplishes one-third more results—in other words, extends his business. Of course it is possible that in some trades the demand may not at once keep pace with the supply after the invention of a labor-saving machine, but the disproportion rarely lasts very long, as cheapness is a great stimulator of want.

Notes.

LITERARY.

MESSRS. LEE & SHEPARD, Boston, have nearly ready Bacon's "Essays," with Whately's annotations, of which an American edition has before been published, but to which Mr. F. F. Heard has added a preface, notes, a glossarial index, and the bibliography of the essays, in all about 100 pages, making the volume superior to any British edition ever published. John Wilson's press has already been used for a large-paper edition, limited to fifty copies. The same house will publish a book of lectures by Henry Giles.——Messrs. Roberts Bros. have in press Count de Falloux's "Life and Letters of Madame Swetchine," translated by Miss Preston; "The Layman's Breviary," from the German of Leopold Schefer, by Rev. Chas. T. Brooks, the successful translator of Goethe and Jean Paul; "My Prisons," by Silvio Pellico, illustrated; "The Friendships of Women," by Rev. W. R. Alger; and new editions of "A Thousand Miles in the Rob Roy Canoe" and "The Rob Roy in the Baltic."——The autumn list of Messrs. Ticknor & Fields embraces, of course, a large number of the works of Dickens, in the various editions of this house, but besides these the following: Mr. Chas. Eliot Norton's translation of Dante's "Vita Nuova," uniform with Longfellow's translation of "The Comedy;" the "Life of Josiah Quincy," by his son Edmund; "Waverley" and "Guy Mannering," in one volume, being the first of a reissue of the Household Edition of the Waverley novels, to match the Library Edition of Dickens, and to make twenty-five volumes in all; a new volume of poems and an illustrated edition of "Lucile," by Owen Meredith, another by Robert Browning, a third by Alice Cary—"The Lover's Diary;" a "Red-Line Tennyson;" "Opportunity," a novel, by the author of "Emily Chester;" a new edition of Dio Lewis's "New Gymnastics;" an illustrated edition of Whittier's "Snow-bound;" Dr. Holmes's "Guardian Angel;" "A Journey in Brazil," by Prof. and Mrs. Agassiz; "A Week on the Concord and Merrimac Rivers," by the late H. D. Thoreau—one of his earliest and most charming works; "Prayers of the Ages," by the editors of "Hymns of the Ages;" and a great variety of juvenile stories, by Mrs. Stowe, Mrs. Child, Grace Greenwood, Alice Cary, etc.

—The permanent loss of California to the liberal party of the country is not probable if the recent political defeat does nothing to impair the common-school system or to diminish the educational zeal of the State. Simultaneously with the news of the election we read in a San Francisco newspaper that more books have been produced in California during the past twelve months than in all its previous existence. These, it will be understood, are entirely Californian, from authorship to mechanical execution. One work, of which the title is not given, but which is said to possess a permanent value, after passing through the press in San Francisco, has been stereotyped and sent East to be reprinted here. They are the first stereotype plates of any consequence ever made in California, and we suppose it is found cheaper to transport them than the volumes themselves, in order to supply the readers of this side of the continent. The growth of a native literature on the Pacific Coast will be watched with interest, owing to the peculiar composition of the population, their geographical independence of the rest of the country, on the one hand, and their commercial and geographical connection with Asia and Polynesia, on the other. The public taste, we should imagine, would be quite as elevated as in many an older Western State.

—Professor T. G. Müller, of Basel, has gathered into one volume all the knowledge extant in books of the aboriginal religions of this country (Amerikanische Urreligionen). It is a well-arranged history, to which, of course, our literature contributes a great deal, and for which the author availed himself also of the rich collection of Mexican and other antiquities in the Museum of Basel. He concludes that the American Indians did not get their religions from the nations of the Old World, but that the origin of these religions is to be sought in the nature of the human spirit, and their differences in the different relations of the American nations to nature. Of course Prof. Müller denies the one-pair development of the human race, and perhaps would not assent to Prof. Huxley's views on the pre-historic distribution of mankind. He shows how every people in Europe has by turns been assumed to be the ancestors of the Indians, Mr. Schoolcraft going so far as to adopt the Jews. Physiologically, the American tribes appear to be of the same origin, linguistically as diverse as the most unlike nations of the other hemisphere, and psychically also diverse, as is seen in their distinguishing religions. The wild Indians, says the author, resemble in their religious views and customs much more the savages of other continents than the civilized nations of their own, and these, again, much more the civilized nations abroad than the savages of the same race with themselves. The first part of Prof. Müller's work treats of the savages, including in its four chapters the North American red-skins, the inhabitants of the Greater Antilles, the Caribs, and the tribes of the eastern portion of South America; the second treats of the civilized nations, viz., the Peruvians, Mexicans, etc.

—The working classes are rapidly ceasing to accept their employers' view of their position and rights, and are all over the world organizing for the enforcement of their own economical ideas. It is, therefore, of the last importance that they should have some better knowledge of the principles of political economy than they can pick up in conversation in factories or workshops. What gross ignorance prevails amongst them on this subject has been well illustrated in the eight-hour agitation and in the debates and resolutions of the Labor Congress the other day in Chicago. The small amount of attention paid to this matter in our schools and colleges is one serious defect in our present system of education. Two gentlemen in London, Messrs. Ellis and Shields, are so sensible of the dangers of popular ignorance on politico-economic questions that they not only have contributed very largely in money towards, but have labored hard themselves personally in, teaching the elements of the science in the local schools. Dr. Hawes, the late Dean of Hereford, did the same thing under the influence of a similar feeling. Dr. John Watts, of Manchester, who has grown up amongst the working-men and may be said to be one of them himself, has now published a "Catechism of Wages and Capital" (London: Simpkin & Marshall), for use in schools, and which grown-up people may read with profit. It deals simply with the economical laws which regulate the relations of employers and employed, being that branch of the science with which the working classes are mainly concerned. If some American publisher would reproduce it we have little doubt he would serve himself, and he would certainly serve the community.

—The deadly consequences of a communication between wells and cesspools and other drainage are well enough known but are too seldom considered. Great pains are often taken to preserve the drinking water from taint in times of pestilence, but the moment the epidemic is over, the old indifference returns. We published some time ago the valuable experience of a correspondent, who urged the utilization of ordinary coal-ashes by mixing them with excreta, and thus converting them into a powerful and inodorous manure. We observe that the congress on the sewage of towns that met last year at Leamington, in Warwickshire, and which has since published in one volume the papers read to it by various authors, was satisfied that a principal cause of failure in municipal sanitary system has been "the unnatural admixture of excreta with large quantities of water," and the prevailing use of water as a means of their removal. The air of the house is tainted, putrefaction takes place in the sewage, which often escapes from the imperfect drains, and makes its way to the wells; and finally the rivers are polluted, and the fish poisoned, while there is no adequate compensation in the employment of sewage as a fertilizer, which, in a sanitary or pecuniary point of view, is a very doubtful experiment. The remedy is the substitution of the earth-closet for the water-closet, by which means the liquid and solid excreta are made portable, inoffensive, and valuable. Details of the working of this system on the Baron Rothschild's estate and elsewhere will be found in the proceedings of the congress.

—A writer in the London *Chronicle* presents some startling statistics of the past and present population of Ireland. Twenty-one years ago there were reckoned eight and a quarter millions of people; sixty-one years ago, 5,574,105; this year, only 5,557,196. In 1861 there were 5,788,415, and every year since there has been a diminution, in spite of increase by births. But though 1867 is nearly equal to 1806, the proportion of the sexes in the two years is far from the same. Then, there was an excess of 50,469 women; now, of 184,756. Emigration has carried off the men. In spite of an enormous decrease of population from 1851 to 1861, the number of deaf mutes increased by 473, or about 8 per cent.; the blind by 1,902, about 19 per cent.; the lame and decrepit by 225, more than 5 per cent.; the lunatic and idiotic by 4,118 on a former total of 9,980! "To France alone, after the scourging conscriptions of Napoleon, could Ireland be compared with any hope of finding a parallel for facts so lamentable."

—The conference on Sunday-schools recently held at the Isle of Wight was closed by the Bishop of Oxford, who had presided over it. He probably caused some astonishment by remarking that Sunday was as much the day of rest for children as for their parents; and inasmuch as God had made children volatile and restless, and sleepy when tired, and disposed to whisper and laugh as naturally as the bee buzzed, it was a mistake "to set

them on a hard bench, and to make horrid faces at them when they began to buzz, or to knock them on the head when they went to sleep." Teachers failed very much on the "Be-good system," which, as the sum of all doctrine, was marvellously unfruitful for men, women, or children. Moreover, there was no natural affinity between the fourteen-years-old pupil and the infant, any more than between the rook and the starling. At the Sunday-school everything should be done to make children happy, but "of course there should be some coloring of Christianity and religious teaching about it." The little ones should especially be taught to sing, and when the school ceased to be wearisome it would become an instrument for touching their hearts.

—In a "Historical and Critical Commentary on the Old Testament, with a New Translation," Dr. M. M. Kalisch has reached the first ten chapters of Leviticus (Longman & Co., 1867). Twelve years ago he published his first volume on Exodus, and nine years ago his second volume on Genesis. In this time his opinions with regard to the early books of the Old Testament seem to have undergone a radical change. His commentary on Genesis admits that "with regard to astronomy and geology the biblical records are in many essential points utterly and irreconcilably at variance with the established results of modern researches." Now he is ready, in the present volume, to side with Bishop Colenso. He finds Leviticus to be the work neither of one author nor of one age, to be desultory and illogical in arrangement, and everywhere fragmentary, and he concludes that the Levitical ordinances were neither known nor carried out before the exile, when the priests were helpless and even objects of charity. Dr. Kalisch goes further in denying a typical meaning to the sacrifices, and examines passages of the New Testament to show how the apostolic writers were infected with the rabbinical spirit of interpretation, and borrowed support for their narrative from the Old Testament with their "as it is written," and proof with their "that it might be fulfilled." Finally, the author rejects the miracles. *The Pall Mall Gazette* bespeaks for him, as a sincere and reverent scholar, courteous treatment at the hands of his opponents.

—A writer in the London *Daily News* confronts the Ritualists with the law by relating the discovery, in the library of the House of Lords, of the copy of the Act of Uniformity, 14 Charles II., 1662, with the roll affixed containing the words of the Book of Common Prayer, which had been detached and lost from the copy deposited with the House of Commons. Technically and practically, therefore, the writer remarks, the two rolls form one engrossed act, and "nothing can be so distinct a proof that the prayers, psalms, rubrics, etc., are the law of the land." He then goes on to state that the second Prayer-book, issued just before the death of Edward II., differed from the first—which was drawn up by a committee of seven bishops and six other eminent divines, under the presidency of Cranmer, in the second year of that reign—in having pasted on its last leaf the note "which appears at the end of the Communion Service, relating to the practice of kneeling and the adoration of the corporal presence." This note was omitted in the third Prayer-book, which was incorporated in the first Act of Uniformity, 1st Elizabeth, and was not restored till the fifth and last revision, 1661, which was incorporated, as we now know, in the act first mentioned as recently brought to light. It is a protest against the Romish doctrine of the Mass, and shows how far the Ritualists have seceded from the ground of Cranmer.

—A curious field of philological enquiry is that pursued by the Rev. Oswald Cockayne, M.A., for whom Longmans publish the third volume of "Leechdoms, Wortcunning, and Starcraft of Early England." The first treatise is upon "Lacnunga," or medical prescriptions, some purely heathen, others a medley of pagan and Christian superstition, and many suggestive of little known connections between the mythology of the Anglo-Saxons and that of the Scandinavians. A more interesting portion is that consisting of dream-readings, some of which are manifestly imported from Italy. A glossary of names of plants from the Cathedral Library at Durham completes the work.

—Chinese imitations of English and American paintings were once the harmless passion of merchants who traded with the "Flowery Kingdom." A reversal of this practice is found in the illustrations to Lieut. Silver's "Sketches of Japanese Manners and Customs" (London: Day & Son, 1867), imported here by Scribner, Welford & Co. They are fac-similes of colored pictures by native artists, and, though we cannot decide whether they fairly represent the originals or not, they are certainly inferior to many plates that we have seen in some rather ancient three-feet Japanese books. They convey, however, a good deal of information about social customs and costumes, a daimio paying a state visit (for instance) with trailing breeches—a fair offset to the trailing skirt. Another sort of fac-simile, imported by the same house, is Andrew Wright's "Court-hand Restored," consisting of twenty-three copper plates exhibiting old law hands, contractions, abbreviations, etc., and meant to assist law students especially in reading old deeds, charters, and records. The use of such a book must of course be greater in England than here, but, as Mr. Grant White has shown in his discussion of Collier and his disputed Shakespearian folio, a knowledge of the handwriting peculiar to certain epochs is indispensable to the critic and the historian. —A remarkably rich collection of ballads is also to be met with here, including John Mathew Gutch's "Lytell Geste of Robin Hood," and other ancient and modern ballads of the outlaw, his history and true character, in two volumes (1847); Dr. R. C. Alexander Prior's "Ancient Danish Ballads," translated (1860) in three volumes, and presenting a curious panorama of Northern manners; "Ballads and Songs of Brittany," translated by Mr. Tom Taylor, after Vicomte de la Villemerqué (1865), to the melodies of which Mrs. Taylor furnished accompaniments; and two fresh importations of this year's issue: "Songs of the Nativity," being Christmas carols, ancient and modern, religious and festive, edited by Wm. Henry Husk, librarian to the Sacred Harmonic Society. Many of these appear for the first time. One, from a fifteenth century MS., tells how

> "Holly and Ivy made a great party,
> Who should have the mastery
> In lands where they go.
>
> "Then spake Holly, 'I am fierce and jolly,
> I will have the mastery
> In lands where we go.'
>
> "Then spake Ivy, 'I am loud and proud,
> And I will have the mastery
> In lands where we go,'" etc., etc.

Only a limited number of copies have been printed (London: Hotten) on large and small paper. About a dozen tunes are added. "A Collection of Seventy-nine Black-Letter Ballads and Broadsides," published during the reign of Elizabeth, 1559–1597, is also, and in a greater degree, new. Its contents hardly permit of classification. Here are three titles: "A Ditty delightful of mother Watkin's ale;" "As pleasant a dittie as your heart can wish, shewing what vnkindnes befell by a kisse;" "A discription of a monstrous Chylde, borne at Chychester in Sussex, the xxiiii. daye of May, this being the very length and bygnes of the same. MCCCCCLXII." A cut to the last ballad showed an infant 6⅝ inches high, which the writer declared God's manifestation against the "stoutnes" of the times.

—*The Broadway* has made a very good start with its first number. One of its articles was by Mr. John Hollingshead, and personally named and described the chief dramatic critics of the London press. The critics were displeased, partly at being named and partly at the small appreciation they got from the writer. The consequence has been that Mr. Hollingshead has been denounced for an intrusion on privacy and for misstatements, and has been obliged to defend himself from half-a-dozen assailants at a time and to correct some of his mistakes in later editions. Mr. Rae comes to the rescue of Mr. Tom Taylor and of Mr. F. G. Tomlins. Mr. Tomlins undertakes to show how Mr. Charles Dunphie spells his name, and between his manuscript and the printer's types the name is again misspelt. Mr. Hollingshead does not overlook this error, nor the fact that Mr. Tomlins has named two other critics who were from delicacy omitted in the *Broadway* article; and he justifies his conduct in making known the critics "who are only half anonymous;" that is, on the side "which they present to their real and only masters, the public," intimating that the actors and managers know the other side of them only too well. He also asserts that the modesty of men like Mr. Tomlins is mere prudery, and that "they contribute little biographies of themselves to 'Men of the Times' and similar books that are living dictionaries" of the supposed secrets which Mr. Hollingshead is blamed for blabbing. His object, he explains, in writing the much-abused article was to prove that he and his fellow-laborers were not "a set of dramatic authors whose sole aim was to conciliate managers and sell French dramatic translations."

—One result of the Emperor Napoleon's descent into the republic of letters is that he can be addressed without impertinence as "confrère" by Alexander Dumas, Sr. The novelist has retained his love of historical writing in one form or other, and being now engaged on a novel to be called "Les Blancs et les Bleus," sought, in order to give tone to it, to make an examination of documents pertaining to the 13th Vendémiaire. The public library to which he applied—in a rather wholesale way, it must be confessed—refused to oblige him, and the author appealed with great tact to the Emperor, "to whom nothing is refused." A flattering allusion to the "Life of Cæsar," and perhaps the recollection of the eminent military ser-

vices of Gen. Dumas, the petitioner's father, under the First Consul, secured the desired favor by Imperial direction on the following day.

—It would, perhaps, require the genius of a Schubert to lay down the canons of lyrical composition so as to secure the truest musical expression for a given poetical thema, but to detect incongruous adaptations is granted to many who cannot lay claim to genius. The practical divorce of words and music is especially evident in the modern opera, whether we look at the trashiness of the original texts or the latitude of their rendering in half a dozen languages. The test is, of course, severest in the recitative. Here there must be not breadth but exactness of expression; and it is a frequent source of very dismal failure on the part of the composer himself. An audacious example of license on the part of a libretto manufacturer is that of the writer who turned Kind's German text of Von Weber's "Der Freischütz" into French for the Théâtre Lyrique. It is after the fatal shot, when the hermit appears to outwit the Devil, and is saluted properly in German by "Sei mir gegrüsst, Gesegneter des Herrn!" (A greeting to thee, blessed of the Lord!) The French translator jauntily uncovers as if on the Boulevards: "Bon jour, Monsieur, comment vous portez-vous?"

—While Berlin has lost two of its leading scholars in Boeckh and Gerhard, it will gain another eminent philologist in the new director of the "Gymnasium zum grauen Kloster" (Gymnasium of the Gray Cloister), Professor Bonitz, long the most able professor in his department in the University of Vienna. When the Austrian Government resolved in 1849 to take the Vienna University from the control of the Roman Catholic clergy, Bonitz was chosen, as a Protestant, to give tone to the new administration. He had already distinguished himself in almost all branches of Greek literature, especially in his criticisms on the "Metaphysics" of Aristotle. His later contributions to the publications of the Vienna Academy showed that he was equally facile in reviewing Homer and the Tragedies. But his scholastic labors did not produce the most important of the results he brought about during his eighteen years' residence in Austria. Through his influence the higher educational institutions were rendered almost independent of the clergy. He also established the "Zeitschrift für das oesterreichische Gymnasialwesen" (Journal for the Austrian gymnasial interest), which has been very efficient in advocating improvements. Such efforts against what they considered the true interests of religion could not escape the opposition and resentment of the Romanists, who lost no opportunity of harassing the zealous reformer, in which they were assisted by the notorious Concordat of 1859, which provided against changing the old institutions of the university. For several years Bonitz has been determined to accept the first appropriate position that might offer itself, and would have gone to Bonn last year but for the derangements there. It is a rule of the Berlin Gymnasium that the director must have the title of D.D., and immediately after his appointment the university at Kiel conferred it upon him—a fresh tribute to his merit, as it is an honor now rarely bestowed by the German universities.

—The Panslavists are at work in earnest. A biennial congress has begun its session at Belgrade, pursuant to a resolution adopted at the ethnographical exhibition at Moscow. The object of these meetings is to establish a uniform language and literature among the Slaves of different countries, in aid of the longed-for "Slavonian unity." At Belgrade they are discussing which language shall be chosen as the basis, and the Russian is likely to carry it, on more grounds than one, over the Czech, the Polish, and the Servian. M. Rank is preparing a Russo-Czech dictionary; M. Seckl, a Russo-Czech grammar, as is also M. Jesbera at Moscow. These works are to circulate in Bohemia, and to spread the knowledge of the Russian tongue. The Servians are not backward in their allegiance, and point to the subjection of many Slaves to the power of Asiatics as an outrage to be remedied by their Russo-Slavonian brethren.

MR. LONGFELLOW AND HIS CRITICS.*

In noticing the preceding volumes of Mr. Longfellow's translation we have already expressed our opinion as to the method adopted by him in his work, and as to the general merits of its execution. The concluding volume but confirms our judgment of the wisdom of his choice of method and the unrivalled accuracy and felicity of the translation. The version of the "Paradiso" gives evidence of the same scrupulous fidelity to the thought of his author, and the same poetic sympathy with his mode of expression, which are characteristic of the version of the "Inferno" and the "Purgatorio." Being less occupied with simple narrative, and containing much more of philosophic speculation and abstract thought than the other portions of the "Divine Comedy," while in passages it displays a higher reach of imagination and a loftier poetic vision than is attained in them, the "Paradiso" is more difficult to translate well than the earlier divisions of the poem. Mr. Longfellow has shown himself equal to the difficulties of his task.

It is utterly out of the question to convey by means of extracts a fit impression of a work which requires to be studied as a whole. We say *studied*, for the poem of Dante, whether in the original or in a translation, is not to be properly comprehended without serious and thoughtful study. Only a comparatively small portion of it—and that the least important, either as affording a knowledge of the author's thoughts, feelings, and character or as manifesting the highest qualities of poetry—is to be read easily, at a glance, and for mere entertainment. The poem is a treatise of philosophy and of religion; it is the expression of a whole theory of life and immortality, and it was written with a purpose far deeper than that of merely affording gratification to the poetic sentiment, or of furnishing amusement for the leisure hours of idle men.

No one who is not able or willing to meditate and to study need expect to find much pleasure in the perusal of the "Divine Comedy" or derive much profit from it. The complaint has been made that Mr. Longfellow's translation is not easy reading, that there is much in it that is difficult to understand, much that interferes with the simple enjoyment of the poem as poetry. But the complaint should go further back—it touches the original itself. The "Divine Comedy" was a hard book to the men of its own land and time. It is a book which no Italian even now can understand without the aid of comments. The difficulty lies in Dante's treatment of his topic, the strangeness to us of many of his notions, in the remoteness of many of his allusions and illustrations, in the subtlety of his thought, in the power of his genius. This fact makes most of the current criticisms passed on the "Divine Comedy" and on the translations of it of very little worth. They are written by persons who are incompetent to judge of the character of the work. Few men have the requisite culture—for it is a special and peculiar culture that is requisite—to enable them to speak critically of the poem. They have no point of judgment from which to view it. Of the newspaper criticisms of Mr. Longfellow's work that have appeared in this country or in England there have been very few which indicated any genuine appreciation of the conditions under which his work was executed; very few show that their authors knew anything more than the external qualities of Dante's poem.

There have, however, been some exceptions. The three notices which have been published in *The World* are marked by knowledge and discrimination. The author's critical taste is not always sure, nor do his principles of judgment altogether coincide with our own, but he writes as a man who has at least sufficient culture and sufficient thought to make his opinion worthy of attention.

A notice which was published in the Philadelphia *Press* of July 24 is also evidently from the hand of one who has made a special study of Dante, and who has acquired a considerable fund of information in regard to the literature to which his poem has given rise. The article is of value from the amount of this bibliographical information which it contains.

We have selected these two notices (for we will treat the three articles in *The World* as forming but a single criticism) for attention not only because of their intrinsic merits, but also because they give expression to opinion in some respects unfavorable to Mr. Longfellow's work—opinions which we cannot but think are founded in a degree on misconception of the nature of the work itself.

The objections made to Mr. Longfellow's work may be reduced to two —first, to the method which he has pursued; secondly, admitting his method, to the manner in which he has applied it.

The critic in *The World* (May 31) says:

"Fidelity to the text of the original has been his guiding principle; and we cordially admit that, in carrying out that principle, he has exhibited an amount of taste and scholarship, and has achieved a degree of success, alike delightful and surprising. The theory of literal translation is not likely to receive any more splendid illustration. In this noble work that theory is put to the test in such a way that the shortcomings now to be noticed bear not upon Mr. Longfellow's own style of work so much as upon the theory itself, with which they are irrevocably implicated. These shortcomings or defects are, first, the too frequent use of syntactic inversion, and, secondly, the too manifest preference extended to words of Romanic over words of Saxon origin."

After giving a series of brief extracts from the versions of Longfellow, Cary, and Parsons, the critic goes on:

"Who does not see that, in all these cases, Mr. Longfellow and, to a

* "The Divine Comedy of Dante Alighieri. Translated by Henry Wadsworth Longfellow. Vol. III. [Paradiso.]" Boston: Ticknor & Fields. 1867.

slightly less degree, Mr. Cary, by their strict adherence to the letter, transgress most gravely the laws of English construction; and that Dr. Parsons, by his comparative freedom of movement, produces better poetry as well as better English? In our last example, especially, Mr. Longfellow's inversions are so violent that to an ordinary reader, ignorant of the original Italian, his sentence might be hardly intelligible. In Italian, such inversions are permissible; in English, they are not; and Mr. Longfellow, in transplanting them into English, sacrifices the spirit to the letter, and creates an obscurity in the translation, where all is lucidity in the original. Does not this show clearly enough that the theory of literal translation, where two languages so widely different as English and Italian are concerned, is not the true one? By Mr. Longfellow's work, as we think, this theory is crucially weighed in the balance and found wanting."

It is Mr. Longfellow's theory, then, that is at fault, and to which the critic is willing to ascribe the defects which he finds in the execution of the work. But even if Mr. Longfellow had failed as completely as we think he has succeeded, we should not be willing to admit that his theory was wrong. The truth is, that this discussion of the theories of translation, with the realists or literalists on one side, and the nominalists or advocates of free versions on the other, is one that cannot be settled. It has its origin not only in difference of taste, culture, and sense of literary art, but in absolute difference of mental constitution. In the last century the nominalists carried the day; at the present time the realists seem to have the field. It is to be remembered, moreover, that there are different objects in translation, and that it is quite unfair to judge all by the same rule. There is no common measure or standard of success for two translations of such opposite character, for example, as Mr. Conington's Virgil and Mr. Longfellow's Dante. It is a pity that we have not two words with which to separate and classify works so different in method and intent. Mr. Conington's prime end was to make a translation, in general exact to the thought of his author, which should be a fluent English poem. Mr. Longfellow's prime end was to make a translation which should give to the English reader the most exact acquaintance not only with the thought, but with the form of expression of his author, so far as it could be conveyed in another tongue. Of course, if Mr. Longfellow had chosen, he could have made a poem in English, and called it a translation of Dante, that should have been more in accordance with modern taste in versification and expression than the work which he has accomplished. But, in our judgment, he chose wisely in determining to make an exact rather than a free translation. For the quality and essential nature of every work of art is primarily dependent on its position in the long and continuous series of works of human thought and genius; that is, on its historic relations. These are expressed not only in its general sentiment, but in its special form. They can be but imperfectly preserved and rendered in any translation, and the best translation is that which preserves the most of them. To translate Virgil into the metre of "Marmion," or Homer into English heroic verse, is not only to neglect the *tone* of the original, but is also to disregard those associations which give to the original its special historic quality. A good translation of a poem is one which succeeds in preserving both its poetic, that is, its universal quality, and its historic, that is, its special quality; and a good translation may be more surely made, by one competent to make any translation at all, by following as nearly as possible the exact form as well as the thought of the author. In the case of Dante, as we pointed out in a preceding article, it is impossible, in an English translation, to preserve the exact form of his poem so far as the rhyme is concerned. The attempts made to translate the "Divine Comedy" into English verse rhymed according to the original, although they show great ingenuity, prove, without exception, that a good translation is not to be made in this way. They are all open to the charge brought by the critic of *The World* against Mr. Longfellow's version, of "syntactical inversion;" but while in Mr. Longfellow's version this inversion is, with scarcely an exception, representative of similar inversion in the original, in the case of Mr. Cayley's, Mr. Dayman's, and Mr. Ford's translations these inversions are not representative of the original, but belong to the English rendering alone, and result from the difficulty of otherwise securing the required rhyme. The form of Dante's thought is thus sacrificed to the form of the English verse. A critic in the London *Chronicle*, who regards the expressly faithful form of rendering as not on an equality with the expressly poetic form, as he terms it, and with whose opinion in this respect we should concur if it seemed to us within the limits of possibility that the original Homer should find a new Homer to translate him, or that a Dante of the nineteenth century should be found to render into another tongue the Dante of the thirteenth, has pointed out the fact that, "of all great poets, Dante is the one who will best bear the expressly faithful form, and that this, indeed, is necessary to the bringing out of his *full* value. The reason for this is, that the literal words of Dante are so supremely excellent in terseness, in energy, in beauty, and in poetic suggestion. The precise verbal shape into which he puts his meaning is constantly the very best shape into which that meaning could possibly be put; and although to follow this out literally in the equivalent words of a different language is not necessarily to follow it out with an adequate amount of beauty in sound diction or artistic impressiveness, it is nevertheless certain to be so far an advantage—one step securely taken in the right direction. Thus the Dantesque translator, with whom faithfulness is the paramount point, may be assured that he need never run in his zeal, but that the more successful he is in faithfulness, the more successful must he also be in phraseology. The faithfulness may, but too probably, not be poetic enough to constitute a fine poem in translation; but, if only carried sufficiently far, it *must* constitute a fine study of style in diction."

And here arises the second objection that has been made to Mr. Longfellow's work, that, whatever may be thought of his method, there are faults in his execution of the task which he prescribed to himself. We readily admit that his work is not perfect; that there are lines which might, without loss of exactness, be rendered more poetically; that there are some inversions which might have been avoided; and that some words are used of which the excellence may be questioned. But we assert that, taken as a whole, Mr. Longfellow's success is a surprising testimony to his skill, to his genius, to his sympathy with his author. Many of the objections that have been brought against special passages in Mr. Longfellow's work lie, as we have said, not against the translation, but against the original itself. He has, doubtless, sometimes followed the order of Dante's words in passages in which another order would have been preferable in English, and has sometimes translated some of Dante's words by their etymological equivalents in cases where other English words were nearer to the absolute meaning of the original; but such instances are rare, and serve as indications of the strict fidelity to the original which has been the rule and is the merit of his work. If at times his fidelity seems verbal and literal rather than spiritual, this is, at least, a matter upon which it behooves the critic to speak with modesty; for the translation generally shows that fidelity to the letter is consonant with fidelity to the spirit, and few critics can flatter themselves that they possess a keener sensibility, a finer taste, a more disciplined poetic judgment, or a better appreciation of the real force of Dante's words, than the translator.

Nor can there be any doubt that, if we apply the test not only of fidelity but of poetic art and charm to Mr. Longfellow's work, we shall find it, as a whole, superior in the highest poetic qualities to any other version of the "Divine Comedy." Take the best passages of the best free "poetic" versions, and let them be compared with Mr. Longfellow's renderings of the same passages, and in almost every instance the advantage of poetry will be with the latter. The most poetic free version of the "Inferno" ever made is, beyond comparison, that of Dr. Parsons (just now published complete). It is the work of a genuine poet and a thorough scholar of Dante, and its special merits are of a very high order. In its kind it is a work that can hardly be too warmly praised; nor is it to detract from its praise to say, that though free it is not more poetic than the literal version of its author's brother poet. It is probable that to the common, uncultured reader there are many parts in Mr. Cary's or Dr. Parsons's translation which would seem more poetic than the corresponding parts of Mr. Longfellow's work; but the original itself would seem less poetic still than the version which is most faithful to it, and the praise bestowed on the translation would be in proportion to its adaptation to modern taste by the presence of qualities not to be found in Dante's work. The realistic method which Mr. Longfellow has pursued is open to the risk of degenerating into a mere verbal literalism. The line between the literal fidelity that is true to the higher inward quality of a poem and that which is content with a mere verbal exactness of rendering, is not to be sharply drawn or absolutely defined; but the strictest verbal literalism is better than a so-called freedom of method which, in its libertine excesses, is faithful neither to the word nor the spirit of the original. Success in such a task as Mr. Longfellow's is to be estimated by the character of the whole work, and not by the consideration of exceptional portions. Whatever special defects and blemishes may be found in it, they bear a very small proportion to the great body of the poem; and if his method of translation be conceded, we believe that no competent critic will hesitate to agree with the critic of *The World* in regarding his achievement, when viewed as a whole, as a "magnificent success."

Fault has been found with certain modes of diction and with the use of certain unfamiliar words in Mr. Longfellow's translation, and in some instances, we think, with justice. Among the words that have been objected to with reason are, "Saraband," "Oppilates," and "Depilation;" but we cannot but think that the translator is in the right in his attempt to familiarize our ear and to introduce, or rather to restore, to our poetic diction

such words as "Benedight," "Maledict," and "Misericord." It is an instance of the minuteness of the criticism to which Mr. Longfellow's work has been exposed, and which it justly claimed, that attention should have been given to these minute details.

There is in some passages of the translation a tone of Italian heard, as it were, under the English words; this was hardly to be avoided, for it is the result of the principle on which the translation was made. But it is rare that this occurs, and the greater part of the poem is a model of pure English diction.

The critic in the Philadelphia *Press* can find, indeed, nothing, or very little, to like in the work; it is hardly more than "a quasi-perfect interlinear translation." He asserts that there are hardly "thirty consecutive lines to be found in it in which the rhythm is perfect and unbroken." We are at a loss to understand what this means. If the writer means that there are hardly thirty consecutive lines of neither more nor less than ten syllables, he is right; but this does not make the rhythm imperfect. The English pentameter is a verse of five feet, but not necessarily of ten syllables; it may have ten or eleven syllables. Mr. Longfellow frequently uses a verse of eleven syllables (the exact counterpart of Dante's own verse), and, by the frequency of its use, gives to the rhythm a variety, fulness, and harmony such as it could hardly have possessed were its lines all strictly decasyllabic. Milton and Wordsworth have both shown with what fine effect the hendecasyllabic pentameter may be used.

The purely critical portion of the article in *The Press* is, as may be inferred from this specimen, of very little value. The author finds the text unsatisfactory, but the notes and illustrations are "disappointing" and "deluding;" there is an "almost entire neglect of the great German scholars, and of nearly all the modern Italian scholars, and of some of the best French scholars." A list is given of some of those scholars whose names do not appear. The author shows a wide acquaintance with the recent Dantesque literature, but a total misapprehension of the object Mr. Longfellow had in compiling his comment. It was not to afford the reader a full apparatus for the discussion of the vexed questions of Dantesque interpretation and textual criticism, but to give him the information requisite for a fair understanding of the poem, and an explanation of the difficulties which one unfamiliar with mediæval thought would be likely to find in it. It was plainly his object to make a comment for the general reader, and not primarily for the critical scholar. But in making a good comment for the general reader, he has made one which the student most versed in Dantesque literature may read with interest, and may often consult for help in forming his critical judgment on a doubtful point. It would have been mere pedantry on Mr. Longfellow's part to cite the name of every commentator whose work he consulted or whose opinion went to the making up of his own judgment. The writer in *The Press* conveys a false impression by insinuating that Mr. Longfellow has neglected valuable sources of information and is ignorant of works of importance to the student of Dante. We have not space to exhibit in detail the mode in which the author of this criticism misleads his readers in regard to the nature of Mr. Longfellow's labors. Two instances must suffice. "There are writers on Dante," says this critic, "who are so well known, so identified with modern Dantesque literature, that not to have used their labors, and not at least to have named their names, is without excuse. Such are Witte" (Witte *is* mentioned once in the notes), "Blane," etc. Now, Witte's labors on the "Divine Comedy" have mainly related to the text, to which he has given long critical study; his illustrative notes to his translation are very brief, and are mainly derived from common sources. Blane's chief contribution to Dantesque literature is his "Vocabolario Dantesco," a work of great value, which every student of the poet has at hand, but is not a book to be cited in a comment. His own unfinished comment is of but little value. Had Mr. Longfellow been preparing a critical edition of the original text-book, Witte and Blane would have, we may be sure, been his constant authorities. So, too, when this writer complains that he has made no reference to Lord Vernon's labors, the reader is naturally led to suppose that the omission to refer to them is a fault, or implies ignorance of them. But the truth is they are not of a kind to afford any great assistance. The early comments which have been reprinted under Lord Vernon's auspices are of inferior value to those of Boccaccio, Buti, and Benvenuto da Imola, which Mr. Longfellow frequently cites, and the edition of the "Primi Quattro Edizioni," published at Lord Vernon's expense, is simply for critical students of the text. The learning of the writer in *The Press* seems not to be accompanied with judgment.

But we must stop. Mr. Longfellow has made a translation which is not only the most faithful but is the most poetic, and will be the most popular, of the versions of the "Divine Comedy."

MR. MATTHEW ARNOLD'S NEW POEMS.*

ALTHOUGH the quantity of verse written nowadays is far greater than at any previous time, no one will be ready to assert that there is a proportionate increase of true poetry. The faculty of verse-writing and of expressing thought, sentiment, or emotion in poetic form, becomes more common with the increase of general culture. But culture, though serviceable to genius, is not productive of it, and an age of culture may be abundantly fertile in excellent verse while it may remain barren of the poetry that has permanent, absolute, and universal worth. For poetry in the highest sense is the expression of the most intense individuality. It is the poet's individuality that affords the measure of his interest and value for mankind. Only the most powerful natures can resist the influence of culture to diminish individuality; weak natures are subdued by it, the strong alone are competent to turn it to the advantage of their own genius, instead of having their genius shaped by it into a more or less exact conformity to the general features of the intellectual life of their times. Culture unquestionably quickens the tendency to verse-writing. It enables the average man to acquire without difficulty the form of poetry, and the exercise of the capacity to write out one's thoughts or feelings in rhythm and rhyme is attended very frequently with an excitement that is, not unnaturally, frequently mistaken for genuine inspiration. But if there be nothing more than this capacity, the exercise of it is a poor, unmanly, and worthless occupation, and, with a higher degree of culture than ours, men will come to regard verse-writing not as meritorious, but as an idle and somewhat debilitating process. There will be fewer volumes of what is called poetry, even if not more numerous volumes of what is poetry.

The lowest exhibition of the poetic faculty is that afforded by the conscious or unconscious imitators of the popular poets of the day. The poets that are most imitated are not always the best; for it is the faults rather than the excellences of poetic style that catch the ear and are mistaken by the uneducated for beauties. The poets whose style is mannered, whose diction is peculiar rather than good, whose sentiment partakes of the prevailing weakness of their times, find most imitators; while those whose style deserves the name, whose diction is simple and whose sentiment is strong, are little troubled by followers in their wake.

But there is a higher class of verse-writers than that of mere imitators, which yet is lower than that of the original poets; a class of writers easily impressed by the force of intellectual currents, susceptible to the delights of the best poetry, highly cultivated, with wide appreciation and genuine love of art, not without thought or feeling of their own, though destitute of what we are forced to call original, creative power, and yet endowed with more or less faculty of embodying in fresh forms conceptions derived from external sources, and of expressing sentiments which can only in a limited sense be called native to their own souls. The poorest writers of this class are very near the best of the class of unconscious imitators, while the best of them approach sometimes near to the level of the true poets. The writers of this class often gain the reputation of poets with their contemporaries, and may, for a long time, even be more popular than the real poets, for they dilute the strangeness of novel originality by a mixture of familiar flavor. Greatness is always remote from men, and seemingly inaccessible. Shakespeare is less read by the mass of each generation than its own second-rate poets. Hawthorne is less popular than Mr. Trollope.

It is among the best of this class of poets that Mr. Arnold has his place. His poetry is not that of a strong original genius, but of a highly impressible, highly cultivated nature. It is the work of a student who has learned the canons of art, who knows how to practise the self-restraint which sometimes almost supplies the place of power—of one who has thought for himself, has loved good poetry, and who, if not inspired, has frequented the sources of inspiration. His poems are most attractive to those who have a sympathy with the scholarly habit they disclose, and who are fond of indulging themselves in sentiment of a fabric not uncommon in our days, of which the warp is honest manliness, while the woof is a morbid philosophico-sentimental morality.

This volume will not add greatly to his reputation. His earlier volume contained some pieces—"The Forsaken Merman," for example—which were inspired at least by a fancy flushed with the poetic wine of youth; but of that sort there is nothing here.

The opening drama, "Empedocles on Etna," was indeed a poem of Mr. Arnold's youth, for it was published not far from fifteen years ago, and it betrays youthfulness not only in its general conception, but also in the details of treatment. It contains, to be sure, much that is fine in its way, much that interests the reader in the character of its author, but it is essen-

* "New Poems. By Matthew Arnold." Boston: Ticknor & Fields.

tially one of the poems of a cultivated, as distinguished from an original, genius. It is Mr. Arnold's version of the story of the conflict of man with the things that surround him in the world, of his insatiable longings, of his overpowered will, of his unquenched desires and unsatisfied doubts. It is a modern rendering of an ancient idea. It is a Germanized Greek-English dramatic sketch. Empedocles is a Greek character in Goethean costume. The very opening lines of the poem jar on the sensitive reader with their modernness of tone, as out of harmony with the assumed antiquity of the character and the scene. Callicles, a young harp-player, is resting on a rock by the path in the forest region of Etna. He begins:

> "The mules, *I think*, will not be here this hour;
> They feel the cool, wet turf under their feet
> By the stream side;"

and so on. Now, this is so essentially modern in tone that it is like a discord to come two lines later to the invocation "O Pan!" followed by another modern line:

> "How gracious is the mountain at this hour."

So it is through the whole poem; there is an incongruity between what it is and what it assumes to be which is not fully compensated for by its carefully studied rhythm and diction, or by the beauty of separate passages. There is enough thought in the poem, enough of metrical excellence, to make it interesting and readable, and to give it a higher claim to regard than that of most such attempts, but it is not a work that *must be* read now or that *will be* read fifty years hence.

A similar incongruity marks the next most important piece in the volume, "Thyrsis, a monody to commemorate the author's friend, Arthur Hugh Clough," and in this the incongruity is more displeasing. In it Oxford and Sicily, Clough and Thyrsis, are painfully jumbled, and the pastoral imagery, far from producing a pleasing effect, only gives to the lament of the poet for his friend an air of coldness and unreality. A piece of worse taste than this poem, from a man of such claims to good taste as Mr. Arnold, is not often to be met with.

The contrast between such poetry as Mr. Arnold's and such poetry as Mr. Clough's shows, perhaps, as plainly as any illustration could do, the difference between the poetry of culture without genius and the poetry of genius with culture. Mr. Arnold has now the wider reputation; but it is safe to predict for Mr. Clough the more enduring fame. There is no poetry of our time more thoroughly individual than his, and none more fully in sympathy with the highest intellectual and moral conditions of the generation to which he belonged. His is almost the only English poetry since that of Wordsworth which is inspired with the large life of nature, and which, by its healthy realism and entire truth to fact, literal or imaginative, material or spiritual, takes rank with the best poetry not of our age alone but of any age. Each of Clough's poems is a clear expression of himself; but many of Mr. Arnold's poems might have been written as well by any one of half-a-dozen contemporary poets of the second order. The sincerity and individuality of Mr. Clough's poems make many of Mr. Arnold's seem, by contrast, quite factitious and unsubstantial.

And, indeed, this impression of unreality is somewhat confirmed by the sort of morality which Mr. Arnold preaches in his minor poems—a morality of truisms that does not save him from scepticism and discontent. He is the poet of a discontent which never rises to the force or dignity of despair. He says:

> ——"The world which seems
> To lie before us like a land of dreams,
> So various, so beautiful, so new,
> Hath really neither joy, nor love, nor light,
> Nor certitude, nor peace, nor help for pain."

And again he says:

> "I sigh that one thing only has been lent
> To youth and age in common—discontent."

And there is much more of this tone in the volume, doubtless to be taken not as Mr. Arnold's clear and abiding conviction, but rather as the temper of an often recurring mood. In some poems, such as one or two of the sonnets, "Progress," "Rugby Chapel," "Palladium," there is a much higher and more manly strain. But the general effect of the volume is not of "sweetness and light."

THE CATHOLIC CHURCH AND MODERN CIVILIZATION.*

The great Œcumenical Council of the Catholic Church having been summoned by the Pope after much deliberation and hesitation, it may be worth while to see what are the most recent utterances of the Church touching its relations to modern society, which this council is doubtless expected to confirm. The Encyclic of 1864 and the accompanying syllabus of "opinions and doctrines which are wholly reprobated, proscribed, and condemned" constitute an authoritative exposition of the principles by which the Papacy is guided in the administration of its spiritual and its temporal power, and set forth in clear and unequivocal terms a part of the pretensions of the Romish See to ecclesiastical and political supremacy. To borrow the dialect of courts-martial, the Encyclic is the charge, the syllabus the specification, of several of the damnable heresies of which our degenerate age is accused, and which, in the opinion of the Pope, would speedily consummate the ruin of Holy Church and the overthrow of all organized human society but for the vigilance of the shepherds of the Church—the bishops—and the miraculous power and wisdom with which its inspired head, Pius IX.—"The Holiness of our Lord," "The Man-God," "God upon earth," as the "shepherds" style him—is gifted.

The Encyclic Letter was issued by the present pope on the "8th of December, in the year 1864, the tenth year from the dogmatic definition of the Immaculate Conception of the Virgin Mary, Mother of God," and is addressed "To our Venerable Brethren, the Patriarchs, the Primates, Archbishops, and Bishops in favor and communion with the Apostolic See." It is written in Latin, and is a good specimen of the style habitually employed by the Papacy in those rare semi-lucid intervals when it becomes conscious of its own impotence, and seeks to effect by coaxing, persuasion, whining, and half-smothered menace objects which it cannot for the moment accomplish by force.

The Encyclic consists mainly of a jeremiad over the *depravatarum opinionum perversitas*, or, as Mr. Hosea Biglow would translate it, "the gineral cussedness" of our times, interlarded with copious references to former bulls, encyclics, monitions, maledictions, and excommunications launched by the present and former popes against modern religious, political, and scientific heresies and heretics, all which condemnations are renewed and confirmed; with self-complacent glorification of the labors, the benevolence, and the "apostolic vigor" of Pius IX. and his predecessors, "guardians and avengers of the august Catholic religion," in resisting the "criminal machinations" of the wicked, who, "frothing like the billows of a raging sea," have sought "to overthrow the foundations of religious and social order;" and with abundant laudation of his venerable brethren for their unceasing watchfulness in detecting error, and exhortations to them to continue their zealous efforts in opposing the intrigues of "the slaves of corruption."

These depraved wretches, it is said, "contrary to Scripture, the Church, and the Holy Fathers, have dared to maintain that the best state of society is that in which the duty [*officium*] of government to put down [*coercendi*] by penal sanction the violators of the Catholic religion, except so far as concerns the public peace, is not recognized. In consequence of this absolutely false idea of social government, they shrink not from cherishing the erroneous opinion, so fatal to the Catholic Church and the heal of souls, which our predecessor, Gregory XVI., called a *frenzy*: to wit, 'that liberty of conscience and of worship is the proper right of every man, and ought to be proclaimed and secured in every well-organized state; and that the citizens have full liberty to manifest loudly and publicly their opinions, whatever they may be, by speech, by printing, or otherwise, without restraint on the part of the ecclesiastical or civil authority.' In maintaining which rash propositions they do not reflect that they are preaching a *liberty of perdition*." Various other equally shocking errors are enumerated, such as, "that the Church ought to decree nothing which shall fetter the conscience of the faithful in the disposal of their worldly goods; *that the Church has not the right to restrain offenders against her laws by temporal punishment*; that, as to the judgments of the Apostolic See, and its decrees manifestly relating to the general good of Holy Church, its rights and discipline, and which do not touch the dogmas of the faith or good morals, men may refuse to conform or submit to them without sin;" and other equally pestilent heresies, all which, as well as all others condemned in previous encyclics and other manifestoes of the present Pope, are emphatically reprobated and proscribed.

All these errors the pastors of "the sheep and the lambs," among which latter are included, of course, such sucklings as Napoleon III. and Victor Emanuel, are charged to combat, and especially to teach, that "the power of kings is given to them not simply for the government of the world, but chiefly for the protection of the Church," and that it is "for the interest of chiefs of states and kings, wherever the cause of God is concerned, to follow his ordinances and *subordinate, not prefer, the royal will to that of the priesthood of Christ*."

The immediate means relied upon for the accomplishment of the great ends contemplated by the Encyclic was a Plenary Indulgence, to revive the piety of the world. This indulgence was to be had by the faithful, good

* "Recueil des Allocutions Consistoriales Encycliques et autres Lettres Apostoliques citées dans l'Encyclique et le Syllabus du 8 Décembre, 1864, Suivi du Concordat du 1801, et de divers autres documents." Paris. 1866.

cheap, in the space of a single month in the course of the year 1865, by the usual methods, prayers to be said before this or that image and pennies to be given in the forms and quantities prescribed by the several bishops.

Accompanying the Encyclic is a circular letter of the same date from Cardinal Antonelli to the dignitaries of the Church, stating that the Sovereign Pontiff has ordered that a syllabus of the principal errors referred to in the Encyclic should be drawn up and sent to all the bishops of the Catholic world, in order that they might have under their eyes the errors and pernicious doctrines reprobated and condemned by him. The Encyclic and syllabus were published in the official and semi-official Catholic journals of Italy, accompanied with an authoritative Italian translation; but the French —who had just then stipulated to withdraw the army of protection from Rome—and other outside unbelievers were left to "puzzle out" the meaning of the Latin text with dictionary and grammar as best they could.

The syllabus consists of eighty articles, each specifying [a damnable heresy, distributed under these ten general heads: 1, Pantheism, Naturalism; 2, Moderate Rationalism; 3, Indifference, Latitudinarianism; 4, Socialism, Communism, Secret Societies, Bible Societies, Liberal Clerical Associations; 5, Errors concerning the Church and her rights; 6, Errors concerning civil society in itself and in its relations to the Church; 7, Errors concerning natural and Christian ethics; 8, Errors concerning Christian marriage; 9, Errors concerning the civil principality [*civili principatu*] of the Roman Pontiff; 10, Errors relating to modern Liberalism.

In attacking these errors, his Holiness is often tilting against windmills, because the opinions denounced are not, and never were, maintained by anybody except such as reject Christianity altogether. In some other cases, the doctrine condemned, though denied in form, is, in substance, accepted and acted upon by the Papacy itself as the foundation of its own supremacy. Thus Article V. prescribes as heretical the opinion that "the Divine Revelation is imperfect, and, therefore, subject to a continuing and indefinite progress corresponding to the advancement of human reason." But the Papacy treats the "Divine Revelation" as previously imperfect every time it defines a new dogma, and it is constantly not only interpreting but going far beyond Scripture and even tradition, supplying their omissions and issuing new precepts on points where those authorities are silent. In fact, the dogmatic and disciplinary history of the Catholic Church is little more than a pretended extension of a revelation assumed to be inadequate to the spiritual wants of man in his career of revolution and progress. And in this very point lies one of the main distinctions between Protestantism and Catholicism; the former affirming, the latter denying, the completeness and sufficiency of the Scriptures as an exposition of Christian faith and duty.

Many of the articles relate to the internal organization and discipline of the Catholic Church, and are of comparatively little interest except to its members, and some either contain a hidden meaning or are trivial and insignificant. We shall notice a few which possess greater importance, and we strongly commend to the study of Protestant theologians and other thinking men the whole of these extraordinary documents, as well as the various earlier Papal manifestoes on which they are founded. They are collected, translated into French, and conveniently arranged for reference in an octavo volume, of which several editions have been lately published at Paris. The Encyclic itself and the syllabus are contained in the same volume.

Article XII. of the second section denounces as error the proposition "that the decrees of the Apostolic See and of the Roman congregations obstruct the free progress of science."

The astronomical theories of Copernicus and Galileo were condemned by such decrees, and Galileo was forced by torture, or at least by the threat of it, to renounce them. The propagation of these theories was unquestionably "obstructed" and "free" investigation into the laws of nature discouraged by these decrees. The conclusion is irresistible that the infallible Pius IX. does not hold the discoveries and doctrines of Galileo to have constituted true steps in the "progress of science," and the faithful are still bound to accept the Ptolemaic system. In fact, the notorious Ultramontane primate of Ireland, Cullen, has lately denounced the Copernican and Galilean theory as false, in an orthodox Roman periodical.

Under the third head, Article XV. condemns the opinion that "every man is free to embrace and profess the religion which, under the guidance of reason, appears to him to be true." Article XVI. denies that "men may find the way of eternal salvation, and obtain that salvation, in the observance of whatever religion." Article XVIII. stigmatizes the belief that "Protestantism is only a different form of the same Christian religion in which, as well as in the Catholic Church, men may be acceptable to God."

The fourth section formulates no article, but cites and confirms several previous manifestoes of Pius IX. in which he had, "in the severest terms," reprobated "such pests" (*ejusmodi pestes*) as "Socialism, Communism, Secret Societies, Bible Societies, and Liberal Clerical Associations."

In the fifth section these errors are condemned: By Article XXI., "that the Church has no power to define, dogmatically, that the religion of the Catholic Church is, solely, the true religion." By Article XXIV., "that the Church has not the right to employ force; and has no temporal power, direct or indirect." By Article XXX., "that the immunity of the Church and of ecclesiastical persons derives its origin from the civil law." By Article XXXI., "that the ecclesiastical courts for judging the temporal affairs of ecclesiastics, whether civil or criminal, ought to be abolished, even without consulting the Apostolic See or heeding its protests."

It is important here to observe that, until a very recent period, under all Catholic governments, priests and all their interests were exempt from the jurisdiction of the lay civil and criminal courts, and clerks could be held responsible and punished only by ecclesiastical tribunals, constituted by the Church, and wholly independent of the civil government of the countries where they exercised their powers. In practice, priests enjoyed almost complete impunity, and were very seldom punished for the most atrocious temporal crimes, penal sanctions being scarcely ever applied except for errors in doctrine or other offences against the Church itself. The Church also claimed and exercised jurisdiction over all questions of property, or other temporal right, between ecclesiastics, and even between laymen and the Church or her ministers. The conscience of the Church in matters affecting her interests is like the conscience of other corporations. A layman, therefore, going to law with the Church or a priest, usually received the same measure of justice that a non-stockholder would obtain against a railroad company before a court appointed by the directors, and composed of conductors, engine-drivers, brakesmen, and stokers.

The abolition of the ecclesiastical courts, and the subjection of the priesthood and the secular rights of the Church to the common criminal and civil law of the land, is the offence of modern progress against which Rome has directed her most furious maledictions, and it is to this question that the two articles last cited refer.

Under the sixth head, Article XLII. denounces as heretical the doctrine "that in case of a legal conflict between the two powers, the civil law ought to prevail." Article LIV. denies that "kings and princes are not only exempt from the jurisdiction of the Church, but superior to it when questions of jurisdiction are to be decided;" and Article LV. condemns the opinion "that the Church ought to be separated from the state, and the state from the Church."

Article LVII., seventh section, warns the faithful that it is erroneous to hold that "science, in respect to matters of philosophy and morals, as well as the civil law, may and ought to be exempt from divine and ecclesiastical authority;" and Article LXIII., same section, denies "that it may be allowed to refuse obedience to legitimate princes, and even to revolt against them."

The Government of the United States not being administered by a "legitimate prince," it was, of course, not unlawful for the slaveholders to "revolt against it;" and this consideration goes far to explain the warm sympathy of the Papacy, of Catholicism, and of all state-churchism with the rebel cause.

Under section eighth, Article LXXIII. denies that "by force of a civil contract a true marriage can exist between Christians," and affirms that "the contract of marriage between Christians is a sacrament, and the contract is null without the sacrament."

In Articles LXXVII. and LXXVIII. tenth and last section, these grave errors are reprobated: "That it is no longer expedient to establish the Catholic religion as the sole religion of the state, to the exclusion of all others;" "That provision has been properly made, in some Catholic countries, for the enjoyment of the right of public worship of different sects by foreigners;" and Article LXXX. closes the black list by denouncing one of the most criminal and dangerous of heresies, namely, "that the Roman Pontiff may and ought to reconcile himself and compromise [componere] with progress, liberalism, and modern civilization."

These few citations are enough to show that the acceptance of the doctrines of the Encyclic by Christendom would at once carry society back to the barbarism of the dark ages, and the language in which they are expressed may seem to readers unfamiliar with pontifical literature less bland and conciliatory than our criticism on the style of the Encyclic and syllabus had led them to expect. They are, however, among the mildest ordinances which have issued from the Vatican during the popedom of the reigning incumbent, who, so far from possessing the gentleness and kindness of nature usually ascribed to him, is really one of the most malevolent, relentless, vindictive, and unscrupulous pontiffs that ever sat upon

the papal throne. As compared with the previous manifestoes on which they are founded, the Encyclic and syllabus are but the cooing of the dove. The earlier bulls, allocutions, and circulars of Pius IX. are one long wolfish howl against the scientific and social progress, the civilized and enlightened Christianity, the spirit of charitable association, and the disinterested philanthropy of modern times, which have done so much for the head, the heart, and the material well-being of man.

A TRIP TO THE AZORES.*

THERE is a virgin charm in one's first foreign country, be it what it may. Horace Walpole found nothing in all Europe so memorable as his first sight of Calais; and to the untravelled American the Azores are, for a month or two, equivalent to so much of Europe. It is from a straining glimpse at their high outline on the first horizon that he first learns truly that the world is round. On landing, he there beholds his first priests and beggars and barons; he sees orange-groves and a stray palm-tree; he sees tiled roofs over which the *Diable Boiteux* might have scrambled, and paved court-yards into which Don Quixote might have ridden; he sees girls with water-jars on their heads, and women with vast capotes, who look like monks, but are not; he sees shops without a pane of glass, and almost without contents or customers; he sees little children who can speak the language, while he cannot. In the blue harbor he sees perhaps gorgeous foreign flags beyond his explaining, while behind these towers a volcano, retired from business, and smoking no more but only steaming.

These things he sees, to be afterwards seen, it may be, elsewhere. And by the time these have grown familiar, he has found out other and stranger things, such as the travelled routes of Europe can hardly show. The church architecture of the islands bears everywhere traces of the Moorish style, and one is constantly upon glimpses of the old Moorish civilization of Portugal. You clap your hand at the inner doorway to summon a servant; and when a good Christian lady wishes to utter a strong ejeculation she says *Oxald*, which means "Would to Allah!" The gardens are Moorish in arrangement and the windowed chimneys in structure; the boys play a Moorish game of ball, under its original name of *arri;* and the people make butter in oriental fashion, by tying up the cream in a goat-skin and kicking it until the butter comes.

Hence it is plainly desirable to have a book about the Azores, and the merit of this little work is that it monopolizes the ground; there is no other. Bullar's work (London, 1841) is out of print; so is Dr. Webster's (Boston, 1821); and we can think of nothing else in English except an article on "Fayal and the Portuguese," almost elaborate enough for a book, in *The Atlantic Monthly* for November, 1860. Senhor Borges' book is therefore really needed, and it includes a good deal of information, in a compact and rather dry form. The writer was a native of one of the islands, and thus possessed a groundwork of familiarity with their general aspect and with the ways of the people. He had, however, been absent eighteen years, and was by his own confession pretty thoroughly bored when he got among his relations once more. It is probably to this fortunate *ennui* that we owe his book.

Yet which of us can claim to write with infallible authority, even upon the affairs of his native land? Inspecting with that microscope which is supposed to be the proper weapon of critics, we find Senhor Borges mistaken in supposing that, among the Western Islands, snow "is never seen anywhere except upon the summit of Pico" (p. 22), whereas we have beheld it with these eyes upon St. George. And we must further protest against the too affectionate vagueness with which he leaves it undetermined whether his friend, the Baron da Santa Anna, drove horses or oxen in his family carriage (p. 128). Happily we can resolve the doubt. Ten years ago, at least, the baron sported an ox-cart with a white tilt—for all the world like a butcher's cart, were the latter only drawn by the same animals in a live state which they in turn transport when dead. More than once have we beheld that lordly vehicle awaiting in some *sargão* or courtyard the descent of its mistress from the ball-room, the oxen patiently munching their hay, while the driver snored upon the mattress which formed the only seat of the conveyance.

The Azores are, as is well known, a colony of Portugal; their population numbers some 250,000. The nine islands are divided into three administrative and military districts, each with a civil and military governor. Well do we recall the latter functionary in the central district—a stately man, with a vigor of moustache which in those days of peace appeared unattainable by mere Americans. There being but a few dozen soldiers to command, he turned his attention to the command of languages, and we remember that in his regiment of words there was a little mixture of uniforms. Thus, when we meekly asked him, in what we intended for clear Portuguese, as to how many years he had been in his country's service, he replied in a happy conglomerate, "*Veinte-cinco annos*—vat you call twenty-cinq year."

It is a little surprising that an Americanized Portuguese should have written several chapters about Fayal, and should have omitted all mention of that untitled prince who resides there, Mr. Charles Dabney, the American consul. He is simply a pacific Rajah Brooke, whose energy and foresight have stamped themselves on the whole island, mainly creating its trade, its agriculture, and even the delicate mechanic arts for which its women are now renowned. He and his household have so endeared themselves to the inhabitants by long years of wise benevolence that, even in the furthest villages of that island, they are simply designated as "*a familha*"—"the family," as if the world held but one. To a visitor from the United States the crowning charm of Fayal for half a century—beyond even its climate and its orange-gardens—has been the beautiful hospitality of one American home.

* "A Trip to the Azores or Western Islands. By M. Borges de F. Henriques." Boston: Lee & Shepard. 1867.

American Pomology. Apples. By Doctor John A. Warder, President of the Ohio Pomological Society; Vice-President of the American Pomological Society, etc. (New York: Orange Judd & Co.)—No department of agriculture, or of its kindred art, horticulture, more deeply interests everybody than pomology, and none of the various fruits is of deeper practical utility than the apple, the most common as it is really the most useful of fruits in a culinary point of view. The amateur apple-grower will find in this manual just what he needs. In his introduction the author sketches the importance of orchard culture, proceeds with a brief history of the apple, then treats of propagation, grafting, budding, the nursery, dwarfing, diseases, site for an orchard, preparation of the soil for trees, selection and planting, culture, pruning, thinning, etc.; the ripening and preserving of fruit; insects; character of fruits and their value; terms used; classification. The last title embraces a description of apples arranged alphabetically under their several divisions, filling 316 pages of the book, followed by selected fruit-lists, suited to various localities of the United States, and a very valuable catalogue and tabulated index of apples, giving name, size, origin, class, season of ripening, quality, and the page on which they are described. There is a general index, but the contents of the chapters and sections are unfortunately omitted, and should be inserted in the next edition by the publishers.

This is a new work by a thoroughly practical pomologist, who has given those interested in apple culture one of the best manuals for immediate reference and use now extant. Every part of the book is well illustrated.

Vineyard Culture Improved and Cheapened. By A. Du Breuil, Professor of Viticulture in the Royal School of Arts and Trades, Paris. Translated by E. and C. Parker, of Longworth's Wine House, with notes and adaptation to American culture by John A. Warder, author of "American Pomology." (Cincinnati, Ohio: Robert Clarke & Co. 1867.)—The author is a French horticulturist of considerable eminence, and has been not inaptly called the Loudon of France. Dr. Warder has done himself credit by his comments on the text, besides his additions, which make the work one of great value to every American vineyard culturist. It contains 144 illustrations. The uncertainty of grape-growing, it will be learned from this book, is not confined to the experience of Americans; skill, labor, and great watchfulness, as taught by both the professor and the editor, are the price of a plentiful grape harvest. This branch of rural industry is attracting much attention throughout the United States—especially in Western Pennsylvania, Northern Ohio, Missouri, and California, the country is likely to become as famous for its wines as now for its products of cotton, tobacco, rice, and sugar.

Home Life: a Journal. By Elizabeth M. Sewell. (New York: D. Appleton & Co.)—Miss Sewell's latest novel is said by its author to have been "written with a wish to illustrate a few fundamental principles of education;" the principles selected for illustration being the necessity of a due regard for the social proprieties, and the needful preparation of the youthful mind for the rite of confirmation. On these important topics it sheds some little light, but in other respects is of no especial value. The purity of its style and of its moral tone might, however, make it a valuable addition to the Sunday-school libraries.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

THE DANGERS OF THE REPUBLICAN PARTY.

THE result of the elections in Maine and California conveys one or two lessons which, we feel satisfied from what occurred at the Massachusetts Convention, the Republican party will take to heart. The one is the danger of relying too much on party discipline, or even the goodness of the principle on which the party is based; and the other is the danger of importing too much of the Puritan spirit into politics.

When Connecticut was lost, last spring, the local papers tried to persuade themselves that their defeat was due to their not having been ardent enough in their advocacy of negro suffrage, and proclaimed that they were going to secure victory next year by working harder for it than ever, and in this pleasing theory they received strong support from the New York *Tribune*. But nobody whom the horn-blowing which precedes and follows elections does not bewilder ever took this in anything but a Pickwickian sense. We took the liberty ourselves, at the risk of being misunderstood, of suggesting that it was not too little negro suffrage but too much which caused the disaster, and that it was the over-reliance of the party on its efficacy which gave the State to the Democrats, by causing the Republicans to pay too little attention to other things. For instance, they flattered themselves that mere shouting for equal rights would make such performances as the nomination of a professed mountebank in the Third District of no consequence; and *The Tribune* and *Independent* here thought that, merely by hurrahing and flinging of caps in the air, the rank and file could be made to swallow him. In like manner, in other parts of the State, the approach of the election was, with singular want of tact, selected as a fitting occasion for the enforcement of a prohibitory liquor law which had for a long time previous been allowed to lie dormant.

Now, the reason why it is not safe in most States to rely too much on the strength of the fundamental idea on which the party organization is based is, that the whole of the party is scarcely ever completely under its influence. In Connecticut, in New York, in Pennsylvania, and in New Jersey, as well as in other States, the ardent Republicans are never sufficiently numerous to win an election. They have to secure their majority by the help of a few thousand who are only lukewarm Republicans, whose political feelings are not strong, who are affected in voting by divers collateral considerations, and who, unless they are well looked after, are as likely as not to go over to the enemy on the day of battle. It is these men who decide political contests in nearly all the closely divided States. We dwelt strongly on this circumstance last spring in commenting on the Connecticut election, although it is something for which, amidst the roaring about "armies" and "banners" and "bivouacs" which the party papers keep up about election time, it is almost impossible to secure attention. The writer of the excellent papers on "Constitution-Making" which have been appearing in our columns, also pointed it out in his article last week, showing that this State has changed sides in politics five times in the last ten elections "by a few votes in each precinct going over from the one party to the other." In 1862 these few thousand votes gave the government of it to the Copperheads, in the very midst of the war, when the zeal of the mass of the Republican party was at white heat, simply because they were somewhat disgusted with the military mismanagement and the excessive touching of Mr. Seward's "little bell."

Now, as long as the success of the party is dependent on the fidelity of these auxiliary corps, their feelings—prejudices, if you will—have to be borne in mind in the management of it. They will support you in the pursuit of your fundamental idea if you do not ask them to sacrifice too much to it. But you cannot work them up to such a pitch of enthusiasm about it as to get them to vote for a "showman" or pugilist simply because he supports it, or to wink at the total disregard of character in nominations or of purity in legislation. The Republican party, unmindful of this, has, in various directions of late, been making rather heavy drafts on their devotion. In Pennsylvania, for instance, they have been arraying themselves against a judge simply because, in the exercise of his judicial functions, he held the issue of legal tenders by Congress to be, as a matter of law, unconstitutional—a performance which the leading party organ, *The Tribune*, to its great honor, had the courage to denounce. Now, there are enough Republicans in Pennsylvania who care more for judicial independence than they do for negro suffrage or the Congressional plan of reconstruction to be disgusted by an incident of this sort, and either stay at home on election day or go into the Democratic camp. We know what was done in Connecticut, and what the result was.

In California the Republican party has suffered itself for five years to be led by notorious knaves, who, while waving their hats for Congress and the black man with one hand, had the other thrust up to the elbow in the State treasury. The main body of the party are so much impressed with the gravity of the contest now going on at Washington that they continue to vote for these rascals while knowing and deploring their rascality; but the main body are not able to carry the day. There is a sufficient number who would rather see the State lost to the Republicans than see the State government in the hands of rogues, and so these go over. The new governor of California is a War Democrat, opposed to the Congressional plan of reconstruction, but he is a man of stainless honor, of antique purity and simplicity of character; and one of the most devoted Republicans and anti-slavery men in the country—a man to whom the Republican party owes much, and who knows Mr. Haight well, and knows the condition of Californian politics—has assured us that had he been in California at the last election he would have voted the Democratic ticket.

We would warn the Republican party that the number of such men—of men who, while ardent friends of equal rights, and thoroughly convinced of the wisdom of the Congressional plan of reconstruction, are yet so alarmed and disgusted by the prevailing political corruption, by the shocking abuses of the nominating system, so convinced that unless we can bring more purity of character to bear on the work of politics neither universal suffrage nor any other arrangement of the political machinery will save our system of government—is increasing, and that nothing but greater deference for their "prejudices" or "simplicity" will enable it to keep the field and finish successfully the great work which it has in hand.

The election in Maine calls attention to another somewhat unfortunate tendency in the organization—though it is a fault not very far removed from virtue—and that is its tendency to introduce a somewhat Puritanic spirit into legislation. Those who abuse Puritanism are accustomed only to look at its bad side. We, on the other hand, it ought not to be forgotten, are accustomed only to look at its good side. We read Macaulay's splendid eulogy of it, and see its wonderful career, forgetting that it belonged to an exceptional era, and that as a permanent spirit in politics it works mischief as well as good.

By the Puritan idea we mean a feeling of impatience at sin in others, and a disposition to repress it by the strong arm. It is something more than abhorrence of sin or impatience of evil and suffering or indignation at the wrongs of others. All these feelings are universal in their nature. Puritanism is purely an outgrowth of Christianity. The ancients had no such sentiment. Socrates was put to death not because he was a heretic, but "because he corrupted the youth," and thus undermined the state. The Roman sumptuary laws did not aim to control individual character, but to check that corruption which was eating out the life of the republic. But when Christ founded a religion resting on personal character; when personal purity became the great aim of life, and personal sin the one thing to be shunned, the feeling of impatience at sin in one's self was not long in passing over into impatience at sin in others, and an eager desire to rescue them from the snares of the evil one. Hence the great missionary movements of Christianity, beginning with St. Paul and worthily represented by the Augustines, Xaviers, and Brainerds who have succeeded him.

Like all other human qualities, this crowning virtue of Christianity was capable of being transformed into an evil. It is an easy step from a genuine Christian sympathy with others and a desire to aid them, to a feeling that we have a right—nay, are under an obligation—to force

our aid upon them and reform them even against their will. If our neighbor does not see that he is committing a sin, is not that all the more a reason for preventing his involuntary wickedness? This impatience at the sin of others, and haste to deal with it as if it were one's own, is the essence of Puritanism. But it is not confined to the Puritans; nor is it peculiar to Protestantism. It inspired the directors of the Inquisition as well as the Covenanters of Scotland and the "Saints" of Cromwell's army. Wherever people are intelligent, thoughtful, and earnest, this spirit will spring up spontaneously among them, to give scope to the intensity of their convictions and the warmth of their zeal. Strength of conviction is in great danger of passing into intolerance. For all people act from mixed motives, and it is not always possible to distinguish this spurious sentiment from the genuine Christian principle from which it springs. The sense of pain at the misconduct of others and of indignation at the wrongs suffered by others are wholly legitimate and praiseworthy feelings. We have a right to prevent others from suffering from violence or fraud—these are matters which concern us all. But when our aim ceases to be the redress of wrongs, and we begin to legislate for the prevention of personal sin, we pass from the sphere of politics into that of morals; that is, bring human laws to bear upon actions which, in their personal nature, concern nobody but the individual man and his Maker—setting up our human judgment as the arbiter of right and wrong.

At the present moment the Republican party is in great danger of suffering itself to be controlled by the Puritan idea. It is made up in great measure of those intelligent but not broadly educated classes who have very positive convictions and very earnest purposes, but who have not learned to appreciate and respect the rights of human thought. More than this, in the stormy times through which we have just passed, the uncompromising zeal of the Puritan element has been of the most signal service. Now, the situation is changed. We have passed from the revolutionary stage to that of constructing, and we need above all things calmness, moderation, and a regard for the rights of all. The English race seems especially disposed to Puritanism; the Germans recognize individual rights more readily than we. The German population in this country was with difficulty won over from the party which promised least interference with their individual liberty. They consented to postpone this to the more weighty issue of universal freedom. Now that this question is settled, they will surely drift back to their old associations if the Republican party is controlled by the Puritan idea.

Puritanism has had a noble history and has accomplished marvellous results. It is through and through heroic and self-sacrificing, even when it has wandered furthest from the perfect law of liberty. Its career in the future may be as glorious as in the past if it will free itself from its bad tendencies, will learn that liberty of thought is as sacred as emancipation of the body, and that legal restraints should have nothing to do with moral acts. It is hardly necessary that we should make the application of all this to the attempts which are being made in Massachusetts and Maine to enforce by law a standard of private morals for which, no matter how high it may be, the community is evidently not prepared.

THE PANSLAVIST MOVEMENT IN EASTERN EUROPE.

Nobody who is familiar with the notion held by the mass of the Turkish population of the Padisschah's relations to Christian sovereigns—they look upon them as very mean and miserable vassals of his, who sent their armies to aid him against Russia for fear of the bowstring—ever believed, of course, that it was simply a desire to see foreign lands or the great Exposition, or to show himself in person amongst the great powers, which led the Sultan to risk so great a shock to Mohammedan prejudices as was involved in his journey to Paris, and which induced the Sheikh-ul-islam to commit so great a violation of Mussulman traditions as to grant him a dispensation for the purpose. Most people supposed that it was the Cretan trouble and the fear of fresh complications arising out of it that led him to take so extraordinary a step. But the danger to the Ottoman empire from the Cretan insurrection—or, in other words, from the Greek question or the Christian question—is one which Turkey has already encountered and ridden over in safety. It has ever since 1851 been perfectly plain that the Turkish Christians, as Christians, no matter of what race, Greek, Armenian, or Slavonic, do not interest the Western world sufficiently to make their troubles a source of peril to the Turkish Government. The Greeks, too, as Greeks, have lost their hold on the sympathies of the rest of Europe. The more people have seen of the Greeks, the less they have liked them, and the less they have believed in their fitness to succeed the Turks on the Bosphorus. The romance which surrounded them in the days of Byron is completely gone, and Frenchmen hear of Cretan heroism with leaden ears.

Russia, who for the last ten years has been biding her time, has become perfectly aware of the change in the Turkish problem, and that there is no hope of doing anything against the Turks by means of a religious crusade. She has become aware, moreover, that the Greeks will not serve her purpose, and that if she is to get hold of Constantinople she must put a mightier force in movement than either Hellenism or Orthodoxy. She has, therefore, given up religious enthusiasm and has betaken herself to Panslavism. We have made mention once or twice lately in The Nation of the agitation going on, through Russian agency, amongst the Austrian Slaves and amongst the Servians. Troubles of a serious character have also been stirred up amongst the Bulgarians. Russian emissaries swarm on both sides of the Danube, preaching the unity of the Slavonic race, and, in addition to this, that all Slaves are Russians. Newspapers for the propagation of these doctrines, and published in Russian, have been established in Bohemia and Hungary, and Slave deputations from all parts of the Continent have been invited to St. Petersburg, and sumptuously entertained at banquets at which the political unification of the race was preached as a sacred duty. In fact, the Panslavist theory has now become a revelation. It has found its disciples and prophets; all it wants is martyrs.

The scheming goes on at St. Petersburg with ruthless determination. Since Ignatief, the godly pilgrim, sought Hesychastic consolation at Athens, a spirit of candor has possessed the Orthodox politicians. Hypocrisy and prevarication are held in contempt. The most secret thoughts and designs are divulged. All who will hear—*omnibus quorum interest*—are told the object of the Czar's mission: the establishment of the Slavonic power. Cato praised Cæsar for being the only one among his contemporaries who knew really what he wanted. The same may be said of the Russian diplomatists. Not so very long ago it was otherwise. Even the aims of Nicholas were often too universal, and therefore vague. His horror of revolutions, his passion for legitimacy, overbalanced his practical military sense. The triumph of absolutism was to him dearer than personal success. Gortschakoff and Milutin are more practical and positive. They dispense with Spanish and Italian intervention and petty German vassalage. They care nothing about liberal principles and their promenade round the world. They suffer even Red Republicanism to prevail where it does not cross their purpose. They are quite ready to unite with radicals and revolutionists as long as it suits their game. Nesselrode marched against Kossuth without previously settling the price with Prince Schwarzenberg. The ruling spirit at St. Petersburg would to-day not equip a single soldier to aid the Pragmatic Sanction. Far rather would he speculate on Garibaldi's exploits. The principle of nationality, once the battle-cry of demagogues, has become the countersign of autocrats. The religious fervor does not extend any distance, and hence the Double Cross is abandoned for the Slavonic Tricolor. The prevailing sentiment is too matter-of-fact to get along in politics with nothing but faith and fanaticism to lean upon. The Patriarch himself has been allowed to degenerate into a mere pensioner of the Porte. The centre of gravity in the East is to be transferred from the catechism to the grammar.

Once the saying used to be, "Who holds the Greek dogma is a Greek;" now it reads, "Who speaks Slavonic is a Russ." That this conception reaches further, embraces more, and that it indicates the political end more accurately than the pseudo-Hellenic swindle, few will deny. Russian statesmanship is no longer restricted to the orthodox Greekdom. All Catholic branches, United Greeks and Romans, Miridites, Bosniaks, and Arnauts, Catholic Bulgarians and Servians, belong to this domain. Religious rivalry in the East is

over. French Catholic propagandism, which slaved in the valleys of Hæmus in favor of the Roman faith and the imperial policy, has thus lost its real object. Lazarists and Jesuits may continue to labor with never so much zeal, but to make converts the missionaries must first turn Slavonians. But the Slavonian soul is the heritage of the Czar. Ten years spent by Pope and Cæsar have thus been rendered useless at one blow. The religious hatred between Catholic and Orthodox in Epirus, between the threefold-split Bulgarians, between Bosniaks and Tschernagorzes, is forced into the background for the same political ends. They no longer hesitate to combine against the Turk, not because the latter holds the Pope and the litany in contempt, but because he levies taxes and reigns. This new political gospel has become wonderfully popular in the empire. To emancipate themselves from the law all sects are ready. The Orthodox propaganda has thus fallen into discredit, while the Panslavistic progresses, and it was this danger that sent Abdul Aziz on his travels. Time—it may be a few months—will show whether his object has been accomplished.

REAL NATURE OF LEGAL TENDERS.

It has been said that the law authorizing the issue of legal-tender notes or "greenbacks" should have been entitled "a law for the collection of a forced loan." This is a harsh expression, and if it had been used at the time of the passage of the law it might even have been called disloyal. It might then have created a prejudice against the Government, and have made it more difficult to carry on the war. We hold that the members of Congress were perfectly justified in resorting to a forced loan, or to any other measure deemed by them to be necessary to maintain the integrity of the nation. We were engaged in desperate war; the law of war is the law of force; and a forced loan could no more be complained of than a forced conscription or draft of men. Both were within the power, nay, were the absolute duty, of Congress, if in their judgment necessary.

In treating the question of the legal-tender note, and the propriety of continuing to use such notes as the money of the country, we are not to be charged with impugning the motives of the law-makers when we say that we must now recognize the law under which the notes were issued as a law for the collection of a forced loan, and we believe such admission will lead more easily to a correct solution of the existing financial problem. Let us admit the law to have been of this nature, and also that the greenback is a bond or promise of the Government issued in accordance with such law, bearing no interest, payable at no definite date, and therefore containing in itself, or in the terms of its promise, no single element of absolute value. The legal-tender note has an arbitrary use purely created by law, it being available to the holder for the payment of debts and taxes; but real or actual value is independent of law, and only exists in any commodity or article when that commodity or article contains in itself a power, or is of its own nature capable of rendering a service to mankind. Therefore, actual or real value cannot be created by law, but can only be created by combining a greater or less proportion of human labor with the gratuity or useful gift of nature, thus embodying labor in a concrete form, fit to render service or meet a desire.

That the legal-tender note is simply an evidence of a forced loan is practically admitted in the form in which the monthly statement of the public debt is made. We read of the several loans as: debt bearing coin interest; debt bearing currency interest; debt bearing no interest. Can an evidence of debt bearing no interest, and payable at no definite time, have any inherent or actual value? Would any one take such bonds willingly? We exchange services, and *value* is the result of the estimation of the services so exchanged. We express value in money, and the token or measure of value or money ought to be as nearly uniform in its relation to the services exchanged as is possible in any embodiment or concrete form of human labor. Money must contain the service, and service involves effort, greater or less in degree but always the same in kind; and as gold and silver contain labor in the most compact and indestructible form, they have been adopted as the materials from which the money of the world shall be made or coined.

We may substitute a paper promise to pay gold and silver; but unless such promise is definite it loses every element of uniformity in its estimation. Its use may be compelled, but value cannot be put into it; the moment the compulsion is removed its use might cease, and if no definite time were then fixed for actual payment in specie it would become almost worthless. If this is admitted or proved, can any sane man continue to claim that a thing which has no fixed or ascertainable value in and for itself, and, therefore, no uniformity, is a proper or just standard by which to measure the relation of all other commodities or services to each other? No man would agree to sell cloth by the measure of a yard-stick which might one day be thirty-six inches long and another day only thirty inches; neither would a miller buy grain to be measured in a basket which should one day contain thirty-two quarts and another only thirty. Yet this is what we practically do, or are forced to do, in the use of legal-tender notes. The element of time, and consequently the element of credit, must enter into all transactions or exchanges, and consequently we must use money to liquidate the credit. Our currency or lawful money adjusts itself to gold, not gold to the currency, as most people seem to think; and no one can predict what that rate of adjustment will be at a given time. Hence an additional element of chance, which cannot be foreseen, must enter into every transaction. Every element of risk must be guarded against, and, therefore, the capitalist, who is the rich producer, constantly taxes the consumer, who is to a large extent the poorer laborer.

We have established a measure which shrinks in length when a cold chill comes over the land from the crazy freaks of an insane or tipsy President; which gains in weight when once the speculators are convinced that the Secretary of the Treasury has force enough to resist the efforts of those whose greed or whose weakness leads them to attempt to live upon the labor of others without performing any service. The weakness of the people lies just now in the widespread conviction that this is a great country and superior to all natural law, and for whose guidance experience is of no use. Therefore we adopt and cherish the stale device of irredeemable paper money, by which despots have despoiled their people ever since bills of exchange were invented, and then, not knowing what hurts us, we endeavor to cure the evil by the enactment of eight-hour laws and the like.

We shall reach substantial prosperity again only when the exchange of services shall be left free, and when the Government shall cease to attempt to *create* money, and limit its attention to its functions of *coining* money. Our legal-tender notes should be funded by the issue of bonds bearing interest and redeemable at a time certain. The country had the services for which the notes were issued, and by those services the nation was saved.

By the last statement of the public debt (Sept. 1, 1867) it would appear that the Secretary of the Treasury has resumed the exercise of the power granted him by Congress, and has withdrawn or paid, during the month of August, $4,000,000 of legal-tender notes, the amount outstanding Aug. 1 having been $369,164,844; Sept. 1, $365,164,844. Yet we have had no evidence of any disturbance in the money market, and no forced decline in the prices of commodities. One need not seek far for the reason; it is to be found in the abundance of the crops, from which abundance come lower prices and a slower and more gradual movement, and hence less demand than usual for capital or for currency wherewith to move the crops.

But something more than this is needed. Having demonetized gold, of which, as a commodity, we are large producers, we have constantly, as producers, a large quantity for sale. Merchants compete for this commodity to pay duties and for foreign remittances. The duties are paid in to the Government much faster than the interest upon the debt accrues, and, consequently, the Treasurer is a constant seller of gold. The demand for home use being only for the payment of duties, gold is, on the whole, the cheapest exportable commodity we have, and we keep but a small stock, except the reserve held by the Government. The gold which ought to be the basis of our monetary system is now piled up in the banks of England and France, which hold jointly about $300,000,000, with the rate of discount 2 per cent. When we prove our intention to resume specie payments and to keep our faith, this idle capital

will flow to us and aid us in our purpose. But we must at once take measures to retain more gold here as a basis for the resumption of specie payments. We may reduce our volume of currency by taking advantage of our abundant crops, but yet our abundant product of gold may keep gold the cheapest of all our crops, and cause it to be exported. Nothing but use, nothing but demand, will induce the supply.

We have just been arguing against the continued use of legal-tender notes or false money, and urged such measures as would cause the use of such money to cease. But we by no means urge an heroic treatment.

We must fix a day at which the greenbacks shall cease to be a legal tender, make them convertible into bonds bearing interest, and cause the accumulation of a reserve of specie upon which the national banks shall be able to resume specie payments. Then the national banks will become a national blessing, because they will meet the want of the nation by furnishing a uniform currency convertible into specie, controlled by the Government and yet independent of it so far as the banking department is concerned.

Let us see if the condition of affairs to-day does not indicate the method by which we may safely and surely reach all our points aimed at:

1st, We want to accumulate a reserve of specie slowly but surely, to do which we must create a demand.

2d, We want to designate a bond desirable enough to induce the funding of legal-tender notes during periods of ease or plenty in the money market, and not when money is scarce.

3d, We want to fix the date when the greenbacks shall cease to be a legal tender and when the banks shall be compelled to redeem their notes in specie.

To meet the first point, the capital of the banks is invested in United States bonds on which the interest is paid in gold, and they are required to keep on hand a reserve of 25 per cent. in lawful money. Let it be enacted that as fast as the interest is paid, viz., 3 per cent. every six months, the banks shall substitute the gold thus paid in place of greenbacks as a part of their reserve. A new demand for a certain amount of gold every six months will thus be created.

To meet the second point, we have in the 10-40 5 per cent bond one which since the war has varied little from par in currency. In easy times it sells a little above, in hard times a little below. At the present time, if offered by the Secretary, the subscriptions would soon absorb the surplus of money, the existing useless quantity of measures of value would be absorbed, and the amount of currency would be brought down to the quantity required to move crops and to conduct business on the basis of the lower prices prevailing, which lower prices, as we have attempted to prove, result from an abundant supply of commodities, and not from forced contraction of the currency.

As to the date at which legal-tender notes should cease to be so, and the banks be compelled to resume, we have indicated to us by our previous plan the term of four years, because in four years, at the rate of 6 per cent. per annum, the banks would have received 24 per cent. in gold upon their capital, and this sum, in addition to the surplus which the Government could easily hold in gold, would be an ample basis for a circulation of $300,000,000 of national bank-notes. Due warning having been thus given of the compulsory resumption of specie payment, all sound bankers would prepare for it by a reduction of loans and discounts. Unsound bankers would be caught and their banks would fail, causing local disturbance but no general crisis, but thus leaving at the disposal of the Government a portion of the bank-note circulation allowed by law to be distributed among the Southern States. We cannot but think, however, that by the steady withdrawal or contraction of our redundant currency and the regular demand for specie, induced by the foregoing plan, the depreciation of our currency would be corrected long before the period of four years had elapsed, and we should have returned to specie payment by an easy and natural process.

Provision should, of course, be made for the Secretary of the Treasury to change the bond offered for one of shorter date or at a lower rate of interest, if large crops and the consequent rapid accumulation of capital should render such course possible. When we state that we may return to specie payment by an easy and natural process, we by no means intend to say that no one will be hurt. We cannot pay the penalty of war, of forced loans and false money, without some damage, but by a plan such as we have indicated the damage may be reduced to a minimum, and it will fall less upon the laborer than upon others.

THOMAS CARLYLE'S INFLUENCE.

It is not from any desire to prevent Mr. Kirk from having the last word that we again recur to the subject of Mr. Carlyle's position and value as a social philosopher. We find little in Mr. Kirk's second letter to call for further remark from us, by way of direct reply, beyond his assertion that in representing Carlyle as teaching that "the only true civilizers and elevators of mankind are the sword and the whip," we are "depicting an abstraction, a being that has never existed." We do not well know what Mr. Kirk means by "an abstraction." What we have here sought to depict is a certain opinion promulgated by Mr. Carlyle as to the means by which the world ought to be governed. Mr. Kirk might reply that Mr. Carlyle does not say this—that he simply says that the wise and strong man ought to rule; but this, after all, would be mere quibbling. If Mr. Carlyle's hero does not find his claims to superior wisdom recognized, then he is to shoot and flog. We know this as well as we can know anything of the kind, owing to the fact that in Eyre's case Mr. Carlyle "clothed his philosophy in circumstance," as Bacon has it. Eyre, it appears, is one of his heroes, and Eyre's mode of dealing with "niggers" is the mode in which, according to Mr. Carlyle, the weak and ignorant ought to be dealt with, when they grow restive and revolt—even if cheated, overtaxed, denied justice, and denied education. One case of this kind goes further to explain what Mr. Carlyle's philosophy is than ten of his volumes would go.

We have nothing to do with Mr. Carlyle's "intellect or real idiosyncrasy;" we are concerned with his social philosophy. That philosophy we find to be morally detestable and logically absurd. We do not simply accuse him of "defending a system tending to the perpetuation of barbarism;" we accuse him of preaching a system which would create and perpetuate barbarism; and we beg to dissent, *in toto*, from Mr. Kirk's assertion that as much may be said of the highest names in literature.

Of course, we view his opinions "through the medium of our own." Through what other medium, in the name of all that is wonderful, can we view them? Mr. Kirk may say the medium is defective; but this is simply begging the question. Everybody judges the opinions of others with such mental apparatus and such training and education as he happens to have, and with the standard of morality in use in his time and country. We make no claim whatever to supernatural wisdom and perspicacity; but we deny Mr. Carlyle's claim to exact them of his critics. What we bring to the work of judging his remedies for social ills is simply the utilitarian test of right and wrong, and the ordinary inductive method of the logicians. It may be that we are not skilful in the use of these implements, and that, if handled by other men, Mr. Carlyle's sermons would come out justified. This may be; but pray show this. Don't tell us that Thomas Carlyle, whose voice is constantly heard in the market-place, is so great a prophet that he has to be weighed and measured *in vacuo*.

Perhaps the very best vindication of our criticism we could offer would be a translation of Mr. Carlyle's last diatribe into everyday English. Some of the writers who have been laboriously confuting him would, we think, if they would take the trouble to do this, be somewhat mortified to find that the philosopher's grand solution of the difficulties of modern English life consists simply in the government of colonies by "younger sons" as absolute monarchs, the reduction of "Quashee Nigger" to slavery and of all white laborers to permanent servitude, the instruction of the whole population in something called "rhythmic drill," and a general dependence on the wisdom and power of the "aristocracy," including, of course, such sages as Mr. Windham, the Duke of Hamilton, and H. R. H. the Prince of Wales. It is difficult to keep a grave face when one finds that it is the production of stuff of this sort, in a picturesque jargon, which has for some weeks been making the earth quake in both hemispheres. Is it really true that to be a preacher and prophet one has only, with "lowering brow and clenched fist," to treat all the facts of life as if they did not exist, and reason on society as if he had the power of manufacturing his own premises?

When anybody can, however, by the mere production of such an article as "Shooting Niagara," create a veritable sensation, it is quite evident that, little as there may be in the production itself, there must be something very unusual in the position of the writer, and in Mr. Carlyle's case this is

undoubtedly true. He can no longer be said to wield much influence, but he has wielded so much in his day that he is still regarded even by many of those who differ most widely from him as a formidable personage. In fact, when he tells us that "we are in the thickest welter of surrounding gluttony and baseness," the most stout-hearted radical can hardly avoid starting and turning pale. It is, therefore, worth while to ask what he has really done for social and political philosophy.

We think it is, in the first place, safe to say that Mr. Carlyle has not made a single tangible, definable addition to it, although he has for thirty years devoted himself to the study of it. It would be impossible to discover in any of his writings either a new idea or the germ of a new process. The two things he has preached are "earnestness" and the value and dignity of leaders; but all the success he has achieved in preaching these has been due to his fantastic eloquence. His mode of inculcating the duty of earnestness was undoubtedly startling and effective, and undoubtedly gave an impetus to certain currents of feeling from which society reaped and still is reaping considerable benefit. He certainly stirred within great numbers of young men, when he first began his preaching, the pulses of a better life. Multitudes of susceptible persons swore, with their hands between his, to go in quest of the Sangrail, to "live their highest," and set their faces firmly against "shams;" and we should be sorry to believe that many of those who did so were not lifted by it permanently to a higher moral plane. But then the text from which the preacher preached was a very old one. "Whatsoever thy hand findeth to do, do it with all thy might," contains, after all, the pith and substance of Mr. Carlyle's teaching on the conduct of life; and the glorification of leaders and heroes, with which he has for twenty years been vexing the world, is simply a roundabout and laborious way of asserting the value of wisdom in the regulation of human affairs—a proposition which was maintained with an abundance of proof and illustration by the Socratic philosophers at Athens, and which, after two thousand years of repetition, is rather flat and stale and unprofitable even when set out in Mr. Carlyle's peculiar diction. There has never been any considerable body of persons prepared to dispute the wise man's title to rule. Even "Quashee Nigger" has always been ready to place his neck under the foot of the Hero; but the difficulty has always been to discover him, and towards the solution of this Mr. Carlyle has contributed absolutely nothing. How to know his King of Men when we see him he has never vouchsafed to tell us.

The result has been that, after making a sensation with his philosophy for a few years—in fact, getting up by its aid a kind of moral "revival"—he has seen it thrown aside as a broken reed. His young men found out that zeal without knowledge was not of much value; that "earnestness" profited a man little unless he knew what to be earnest about, and that Mr. Carlyle's plan of having the world governed by heroes was about as useful as the plan recommended so often to children, of catching birds by putting salt on their tails. The "school" tried to prolong their existence for a few years by becoming "Muscular Christians," and warring against evil with their fists and in old clothes. The wicked were disposed of in every direction in three or four easy rounds, and some progress was made in persuading the world that there was a natural connection between piety and muscle. But this movement has not been successful either. The reasoning faculty, to which the race owes most of its progress and happiness, and which, for the most part, shapes its destiny, though often made light of by quacks and false prophets, never wholly loses its supremacy in the civilized world, and it has thrust Carlyleism aside at last, as it has so many other superstitions, fallacies, and delusions. His doctrines and his arguments have been handed over to the "economists and calculators" of the Lindsay and Spence school, to whom the chief end of man is to make ten per cent. on capital, and the rising generation has, as our English correspondent pointed out last week, gone after John Stuart Mill. Mill now reigns supreme, simply because he preaches the principle which has for four hundred years been struggling to assert itself in every civilized country, that sociology is a science, and that its secrets must be got at by ordinary induction, by observing and recording, and not, like Mr. Carlyle, ignoring the facts of life and the laws of human nature; that men, being more than animals, must be governed through their reason, and that, however society may change, and in certain phases seem to deteriorate, there is in it, nevertheless, on the whole, a continued and steady progress towards good; that each century is but a moment in human history; and that the horror of change, the fear that we are in the rapids, and that the great abyss is at hand, of which Mr. Carlyle is in our day the grotesque exponent, is a phenomenon as old as civilization. The only thing peculiar about it now is that it appears in vituperative magazine articles instead of stories about eclipses, showers of blood, armies in the sky, big black dogs, and other signs and wonders

PARIS GOSSIP.

PARIS, August 23, 1867.

THE absence of the court and the fashionable world seems to have no effect on the popularity of the wonderful show which, it is now certain, will be closed on the last day of October. The physiognomy of the "Gasometer" and its adjuncts has changed during the last month; the crowds which fill them being now composed, for the most part, of the numerous classes of summer tourists set free by the recurrence of the annual vacations of the learned professions and the "slack season" of manufacturers and well-to-do shopkeepers. The crowd is consequently somewhat less elegant, but is just as dense as ever, especially about those objects which the public has taken from the first into special favor. Prominent among them is the making of felt hats, from the disintegration of the wool to the sale of the finished head-gear; the life-size groups of peasants and warriors from every part of the globe; the chocolate worker that breaks up the cocoa-beans, converts them into chocolate, folds up the same in paper with the maker's name in gilt letters, fastens each packet with sealing-wax, and stamps the wax with the seal of the firm; the wonderful performances of Bradford's washing-machine, cleaning, drying, and calendering linen almost as by enchantment; the great French bake-house in which bread is made by machinery, and the American cottage in which biscuits are produced in like manner, and sold, hot from the ovens, to the admiring crowds; the wood-carvers, flower-makers, and Tunisian silver-workers; the cutting of diamonds presided over by Costa, the great lapidary of the age, to whom the "Koh-i-noor," the "Star of the South," and all the other great diamonds of recent discovery owe their present splendor; the lace-makers and weavers of silk; the French artificial flowers, not to be distinguished in broad daylight from nature's handiwork; the Italian alethoscopes with their marvellous effects of light, which have so completely thrown the ordinary stereoscope into the shade; the grand displays of the English silversmiths; the unrivalled opals in the Austrian section; the glass of Hungary, France, and England; the hideous group, in the India department, of an enormous lion and tiger of similar proportions, tearing each other to pieces—a miracle of stuffing; the making of great blocks of splendid ice by steam, and the freezing of bottles and decanters by the aid of sulphuric acid; the pneumatic machine; the model of the Suez Canal; and, fully as popular as these, the "lift," which is incessantly carrying up adventurous parties to the restaurant established on the roof of the Machine Gallery, the loftiest part of the building. All these are surrounded, by about two o'clock, by crowds so dense that circulation is practically suspended in the vicinity of each.

In order to give a new lease of publicity to valuable inventions which have failed to command sufficient attention amidst the enormous rivalry of so complete an epitome of the world's achievements, and also to facilitate the sale of goods that may remain unsold at the closing of the Exhibition, the Government has decided on granting the hospitality of the old Palace of Industry in the Champs Elysées to all exhibitors who may wish to avail themselves of such accommodation. It is scarcely doubtful that a great number of exhibitors will gladly avail themselves of an arrangement that will help them to the attainment of what seems just now to be the principal aim of all, viz., the sale of their "exhibits," which they seem to prefer doing at almost any reduction of price, rather than take them home. Visitors to Paris, with a little ready money to dispose of, would be able, towards the close of the Exhibition, to pick up any quantity of "bargains," so great is the reluctance generally felt by exhibitors to retain their wares after the close of the present show.

A tolerably *piquant* book might be made out of what may be called the "by-play" of the brilliant gathering that has brought together the ends of the earth and the extremes of the social scale as never before, and of such a book not the least readable chapter might be furnished by gleanings in the "Gasometer" itself. Think, for instance, of the feelings of Count X——, possessor of a rare copy of "Brantome," which he had confided to one of the most renowned bookbinders of the present day, with orders to spare no expense in binding the same in a style that should be at once a testimony to the value attached to it by its owner and also a memorial of the possibilities of the art of bookbinding at this stage of the world's development, and who, having consented, at the prayer of the bookbinder, to allow the latter to display the work as the crowning glory of his stall in the "Gasometer," discovers, on going to feast his eyes on this treasure, that the three volumes of the same, most magnificently bound and ornamented, bear on their backs, superbly gilded, the words: "'BRAN. *Tome* I.' 'BRAN. *Tome* II.' 'BRAN. *Tome* III.'"!

In the Frigard trial, some of the curiosities of French judicial procedure were displayed in the speech of the prisoner's counsel, who dwelt long and eloquently on the virtues of Madame Frigard's father, an eminent Norman

apothecary, who not only attended the poor for nothing, but lent them money when hard up, which, unless he was luckier than most country apothecaries, he must have found a losing game. The very least the peasantry could do for such a man was to build him a monument, and this they did, raising 1,400 francs for the purpose. The eloquent advocate, M. Lechaud, who stands at the head of the French criminal bar, here reached his climax, by declaring that "God owed the prisoner's father a recompense for his virtues;" but your readers will never guess what the recompense was. It was his "not allowing him to live to see this trial." Madame Frigard, by the way, wore at the trial a dress of the fashionable color—*feuille morte*—which may drive it out of use, as Mrs. Manning's wearing black satin on the gallows, twenty years ago in London, drove that out of all "genteel" drawing-rooms. Anything to equal Frigard's stupidity does not often appear in court. She seems to have left nothing undone to leave traces of her at every stage in the tragedy. She showed herself at the hotel after the murder, as if to fix her appearance in the minds of the waiters; enquired for her companion, as if to impress on them the fact that she had had a companion and that she was missing; and, as a crowning bit of stupidity, enquired the address of a jeweller, pawned a brooch with him, and left her address; so that, as soon as the body was discovered, the police were able to walk straight to her lodgings. A more striking illustration of the way in which a murderer's deliberately-taken precautions work for his destruction is, perhaps, not to be met with in the annals of crime. Madame Frigard herself is, in her self-reliance and business talent, a typical Frenchwoman, and her case brings up once more the question so often asked—How is it that the French *jeune fille*, educated, as she is, in complete seclusion from the world, and, above all, from the world of men, and kept systematically in as childish a condition as possible, nevertheless turns out the most enterprising, self-possessed, energetic, and capable married woman on the face of the globe? If Madame Frigard had been an Englishwoman, or even an American, she would, when her husband failed in business, have been left in helpless misery with her children in some obscure corner, while he went to the metropolis to seek his fortune; but being French people, it seems the most natural thing in the world for him to stay at home with the children, and for her to go to the capital and use her wits, to procure for them all a fresh start in life. Does n't it seem from this as if, after all, nature had more to do, and education less, with making women what they are than we are in the habit of supposing?

We had hardly got done with the Frigard sensation when "Jacob the Zouave" came on the stage. Jacob is a gentleman serving in the Zouaves. He has discovered in himself the power of curing people of all kinds of diseases, but notably of curing cripples; and the talent being as rare as it is useful, he got an indefinite leave of absence and set up in business as a panacea. As his fame spread, the street leading to his house became crowded densely from morning to night, so that it took twenty "*sergens de ville*" to keep order. Jacob seems to be a magnetizer. His patients find him in a kind of trance, from which he wakes up at the summons of an attendant to see his batch of incurables seated on a form in front of him, their sticks and crutches being carefully stowed away in a corner; and he then, after taking a cursory view of them, and "eliminating" any cases he does not take a fancy to, *orders* the others, in a loud voice and with abundant gesticulation, to get up and walk, and, as the story goes, up they get and, with much whining, away they go. Unluckily for Jacob, however, Marshal Forey, who has one side paralyzed, took it into his head to try him, and visited him with his aid-de-camp. The marshal's crutch was removed, and he was told to get up and walk in the usual manner. He tried to obey, and shuffled over thirty paces with great difficulty, and then dropped down. The rumor got abroad that the marshal had been cured, but Captain Bidot, the aid-de-camp, denied it, and Jacob has been ordered back to his regiment as "a failure." The stoppage of his career is, however, perhaps as much due to his having scandalized the clergy as to his professional shortcomings. To have miracles going on in which they had not a hand was more than they could stand, and in such cases they generally in this country get aid from the secular arm.

Correspondence.

THOMAS CARLYLE'S POSITION.

To the Editor of The Nation:

Sir: You would hardly be willing to print, if I were disposed to offer, a rejoinder of corresponding length to your last article on Mr. Carlyle. Indeed, if your remark that there "may be on grounds of taste objections to the language" in which you had before spoken of him, is to be understood as an admission that such objections are sound, my object is substantially gained. I had no wish to defend Mr. Carlyle's opinions or to controvert yours. If there be, as you intimate that there are, persons who "pin their faith" on him as their teacher, they have ill-comprehended or ill-applied his teachings. But I cannot help doubting the existence of such a class. Those who have really felt his influence would be among the first in asserting their own freedom of judgment; while the tribe who find it convenient to cite his authority when it happens to afford a shelter to their own prejudices would be the last to accept his guidance where his path no longer runs parallel with their accustomed track.

Conceding by implication a want of good taste in your use of the epithets "foolish" and "conceited," you yet contend that they were, as so applied, only a mild expression of the truth. Your arguments do not, however, strike me as touching the intellect and real idiosyncrasy of the man. They show at most that his opinions, viewed through the medium of your own, on questions of great moment are fraught with error which, if triumphant, would be fatal to the world, and that his manner of promulgating them is vehement and dogmatic. But this is simply what men of all parties have asserted of their opponents in the long conflict of ideas. We have left off persecuting on these grounds. Perhaps we may one day come to understand that it is by the stagnation of thought, not by its clash, that the vitality of society is endangered.

When you represent Carlyle as teaching that "the only true civilizers and elevators of mankind are the sword and the whip, and that anybody who maintains that the helpless have rights is a knave or a fool," you are, surely, depicting an abstraction, a being that has never existed. Let it be granted that, on some points, Carlyle has shown a lack of sympathy, of insight, and of tolerance—that he has defended a system tending to the perpetuation of barbarism, and denounced a cause involving the hopes of humanity. More than this cannot be pretended with a shadow of plausibility. As much may be asserted of some of the highest names in literature—names that are now mentioned only as those of the lights and benefactors of mankind. It is, in fact, no uncommon characteristic of great thinkers that they have stood aloof from or resisted the movements that, whether on the surface or still more strongly as undercurrents, gave the impulse to their time. The tide of their own thought, disengaged from its eddies, cleared from its impurities, was to give the impulse to an aftertime. Tacitus and Marcus Aurelius, devoid of superstition, saw in Christianity only a form of superstition. Erasmus, the flagellator of priestly corruption, tyranny, and ignorance, looked coldly on the innovations of Protestantism. Dr. Johnson, most sagacious, most tender-hearted of men, denounced the War of Independence not a whit less violently than Carlyle has denounced the war for the Union. Burke, the philosopher of constitutional liberty and a champion of American rights, was thrown into paroxysms by the great uprising against absolutism and feudal privilege. Guizot, the expounder of historical progress and development, opposed, till submerged by it, the flood of democracy.

I might even cite names more illustrious than these. I might remind you that, while ignorant multitudes readily opened their hearts to the Gospel, it needed a miracle to convert the persecutor Saul. I might remind you with what bitter contempt the masses are always spoken of by the "poet of humanity;" and how Goethe, greatest of Germans, was also the only German who refused the part assigned him in the War of Liberation, declaring himself "unable to hate the French," the oppressors of his country.

When you confess to deeming it better that Carlyle "should never have written a line than that he should write as he is writing now," you will pardon me, I trust, for being reminded of the many pious but timid souls who think of Voltaire and Rousseau as apostles of Satan.

One more observation, and I have done. You say that you "do not know what the fate of the democracy may be," and you say it in a tone which might suggest the inference that you do not much care. At all events, you are willing that any form of government shall perish, if the end of government be attained. Yes; but it is through forms and systems, and through the men by whom they are moulded and regulated, that history is carried on. It is not by self-assertion that democracy will live; it is not by the denunciations of enemies that it will die. Ably and honestly guided, it may fulfil all that you hope from it; guided as it now is, not by one party or by one leader, but by all parties and by all leaders, it will not and it cannot come to good. Doubtless it will have had its use, as a reaction against the evils and abuses of the opposite system. Doubtless it may, in its decay, deposit the germ of something better. More or less adequately it will perform its destined functions; just as, in past times, feudalism and monarchy,

"the Charleses (?), the Napoleons, the Fredericks"—you fail to include the Gustavuses and the Cromwells—performed theirs. As for "the Rob Roys and the Eyres," I resign them to your mercy.

With much respect, your obedient servant,

J. F. KIRK.

DORCHESTER, Mass., September 6, 1867.

"SWEETNESS AND LIGHT."

TO THE EDITOR OF THE NATION:

Your correspondent, "A Philistine," says that "true culture has been well defined by Arnold—sweetness and light." It seems to me that Mr. Arnold has received altogether too much credit for his very vague definition, which, whatever be its merits, has certainly no claim to originality.

In Swift's "Battle of the Books" the spider is presented as the advocate of the moderns, and the bee of the ancients. The spider argues, on behalf of his brethren and himself, that he spins wholly from himself, and scorns to own any obligation of assistance from without. The bee, as advocate retained by the ancients, answers: "Whatever we have got has been by infinite labor and search, and ranging through every corner of nature. The difference is, that instead of dirt and poison, we have rather chose to fill our hives with honey and wax, thus furnishing to mankind the two noblest of things, which are SWEETNESS AND LIGHT."

It will be seen that not only the definition of culture as "sweetness and light," but also that it should be "diffused among all and not monopolized by a few," is contained in this truly beautiful and poetical simile.

Mr. Arnold's strength is rather in quiet perception of all beauty, critical acumen, a pointed, semi-French rhetoric, which is new and attractive in an English dress, than either in superiority of thought or power of concentrated expression. Whatever excellence there may be in the definition of culture, then, ought to be accredited to the true author. Indeed, it may be questioned whether the original is not the better; and whether the vague words which Arnold has borrowed, while they admirably perform the office of indefinite suggestion, and serve well as the text of a lively essay, are at all suited to convey any scientific truth or exact theory.

W. W. N.

GERMANTOWN, Pa., Sept. 12, 1867.

MATHEMATICS IN COURT.

TO THE EDITOR OF THE NATION:

The question of forgery is involved in the "Howland Will Case," and it is contended that two signatures must have been traced.

Mr. Crosman was engaged in examining different signatures of various individuals with reference to the question of signatures repeating themselves. He "stated at great length the result of the comparison of these signatures; that he found many of them to cover much better than the signatures of Miss Howland to the second pages and to the will; that in one case both lines, 'Your obedient servant' and 'Joseph B. Spear,' covered much better than the two signatures of Miss Howland."

The whole case was closed by the testimony of Prof. Benjamin Peirce upon the doctrine of chances. I quote from this testimony as follows:

"In the case of Sylvia Ann Howland, this phenomenon could occur only once in the number of times expressed by the thirtieth power of five or more—exactly, it is once in two thousand six hundred and sixty-six millions of millions of millions of times, or 2,666,000,000,000,000,000,000. This number far transcends human experience. So vast an improbability is practically an impossibility." How then to account for "Your obedient servant, Joseph B. Spear," and other duplicate signatures?

Now, I would ask if all this testimony of Prof. Peirce's is not irrelevant? The signatures that do correspond, and are not forgeries, are facts, and by the side of this doctrine of *chance* they seem to prove that figures cannot always be trusted. It appears to me that the case in question is not amenable to the laws of chance. It is always a person's *intention* to make the signature similar to others as nearly so as possible every time. The elements of will and desire unfit it for judgment by such laws. Figures can be prostituted to prove almost anything, and were it not for Prof. Peirce's high position, one might be led to think his evidence nothing more than a special plea. And the tone of his testimony is arrogant and positive, as if he were charging the judges.

I doubt very much whether "all the mathematicians of the world" will instantly recognize the correctness and applicability of this doctrine.

V. X.

[Mr. Crosman's testimony does not in any way conflict with Professor Peirce's, for the conclusion of the professor's testimony is not that there may not or do not occur exact coincidences in the signatures of certain persons, but that in the case of Sylvia Howland such a coincidence would be a most extraordinary event, unless designedly produced by tracing or other form of forgery. The evidence on which this conclusion is founded is a minute comparison of about fifty signatures of Miss Howland each with all the others. So irregular were the signatures found to be that a coincidence so close as that of the alleged forgery ought not to be expected more than once in 2,666,000,000,000,000,000,000 cases of comparison. This calculation is not affected by the fact that other people write more regularly than she; it is based simply on an investigation of *her* habits of writing. This investigation might be called in question as being in the nature of things somewhat arbitrary so far as determining what are and what are not cases of coincidence. No two individuals of any species whatever could be found exactly alike if examined with sufficient minuteness. It was accordingly necessary to resort to the practical judgment of common sense to determine the data for this calculation; and the value of the calculation, which is a very simple one, depends wholly on the judgment used in observation, and is not a mathematical question at all. The procedure was substantially this: The thirty down-strokes of Miss Howland's signature were chosen as test objects. In comparing any two signatures, as many of these lines were made to coincide with corresponding ones as in the judgment of the observer could be made to do so. The coincidences, or what in the judgment of the observer were deemed coincidences, were counted, and the whole number of coincidences in the 1,250 comparisons was found to be to the number of non-coincidences as one to four nearly, or to be about one-fifth of the whole. The relative frequency of the occurrence of different numbers of coincidences in single comparisons followed the law of chance very closely, showing that the several coincidences were independent, accidental events, and hence, for the whole thirty to occur (the independent chance of each being one-fifth), there is only the chance measured by one-fifth to the thirtieth power. This conclusion is not invalidated by the fact that in the signatures of other persons exact coincidences do happen, unless it can also be shown that these persons generally write as irregularly as Miss Howland did. The effect of a person's *intention* to make all signatures alike, which "V. X." refers to, is fully taken account of in the investigations of the person's *habits*. There is nothing whatever in what "V. X." says about the "elements of will and desire." His comment on the tone of Professor Peirce's testimony is hardly just. Mr. Peirce has a not very wise way of putting his testimony in the most paradoxical and at the same time positive form he can devise, thereby making it very much less effective on the minds of common folks. If he appears arrogant, it is probably from a desire to make up in the earnestness of his statements the lack of convincing clearness—to supply his audience with a lively faith in default of a clear understanding. He is a little too much given to impute a certainty to the results of mathematical computation which only belongs to the processes and not to the data of the computation. The value of the present testimony depends wholly on the judgment of his son in estimating coincidences, and does not depend on the judgment of either father or son as mathematical experts.—ED. NATION.]

CONTRACTION.

TO THE EDITOR OF THE NATION:

SIR: The remarks on this subject in THE NATION of August 22 seem to need qualification. It may seem a mere truism to say that the more greenbacks a man held, the richer he would be, provided he knew that he could get gold for them. But when it is added that, "*therefore*," the withdrawal of a portion of the legal-tender notes would not cause the remainder to bear a higher value in gold, we must demur very strongly to the inference.

Following the lead of the article referred to, we may first admit that, as a measure of value and means of effecting payments, the Government has a direct control over the value of its paper currency, and might even make it, under certain circumstances, more valuable than gold. But as, in fact, the Government has never ceased to regard gold as a legal-tender for debt and a measure of value, it follows that if the paper promises by withdrawal should become more scarce and hard to obtain than gold, the latter would at once begin to be used instead, and the two would circulate side by side. In other

words, specie would be at par, and specie payments would be virtually resumed. This is precisely what the advocates of contraction propose as the simple and only safe way of restoring the currency.

Now, taking the second aspect of the greenback, as a simple promise to pay gold, which is depreciated because the promise cannot be kept, is it not plain that, with every withdrawal of currency from circulation, the payment of the remainder becomes easier and less remote? If the Secretary of the Treasury had been allowed by Congress to go on selling bonds and locking up the proceeds out of the reach of banks and speculators, should we not have been saved a large part of the expansion of credit, advance of prices, speculation, extravagance, and consequent stagnation which have cursed the last two years? One hundred or even two hundred millions of currency might thus have been withdrawn with far less damage to the people than they have actually suffered.

All plans for partial redemption by substituting new forms of credit on an arbitrary basis are impracticable and essentially unjust. All should be placed on the same footing; if the Government offers to redeem any part, it should be prepared to redeem the whole. This can easily be done when the amount of outstanding notes has been sufficiently lessened. There is absolutely no other safe way.

We must remember that, though the principles involved are extremely simple, their application is most complicated. On these four hundred millions of United States promises are based more than double that amount of bank promises, and specie payments cannot be safely resumed until the whole of this vast mass has been brought into an approximate equilibrium with specie. In other words, the banks must be compelled to diminish their liabilities to the people to a point at which they can meet all demands on them in specie or its equivalent, as they did before the war, and they can only be compelled to do this by the withdrawal of the legal tenders, which have formed the basis of their previous inflation. Thus the contraction of the greenback currency is doubly important to the restoration of correct values.

J. S. R.

NEW CABINET EDITIONS OF THE

WORKS OF WASHINGTON IRVING.

In announcing several new editions, in a style of improved elegance and convenience, of the Works of Washington Irving, the publisher would take the opportunity of acknowledging the good reception which his efforts in the presentation of these favorite writings have heretofore received. In the several forms in which the various productions of the author of the "Sketch-Book" have been given to the public, it is estimated that the sale has reached no less than fifty thousand of the series, or more than a million volumes. Nor is the demand yet abated. On the contrary, new exertions of enterprise are required to meet the desires of a new generation of readers, and keep pace with the progress of taste and refinement in the typographic and other mechanic arts of the publisher's calling.

The motive of this perennial popularity is not far to seek. It is to be read on every page of the delightful volumes in which "Geoffrey Crayon" infused the happy inspiration of his genius in his devotion to themes which will always be regarded by successive generations of readers with no ordinary emotions of interest. The charm of the felicitous style of Washington Irving, the reflection of the amiable poetic spirit of the truly refined gentleman, would be felt on any topic on which the author had been pleased to bestow it. But it is for the ever-enduring fame of Irving that he chose for the exercise of his pen topics of undying value and importance. In his inviting essays on human life and character, in portraying manners, as in the "Sketch-Book," "Bracebridge Hall," and other volumes, he has touched, with mingled sentiment and humor, those emotions which are implanted in the hearts of all; while his topics of biography, of history, and romance are of such world-wide celebrity and passionate interest as the story of Columbus and his followers, with their discoveries of the New World; the life of the founder of the nation, George Washington, drawing with it the narrative of the Civil and Military events of America during his remarkable career; the marvellous record of Mahomet, with the illustrations of the genius of his race in the romantic fact and legend of "The Tales of the Alhambra" and the "Conquest of Granada;" the felicity with which the author has linked his name with the birthplace of Shakespeare, the genius of Oliver Goldsmith, the fame of Scott and Byron, and, not least, the humorous invention which, in Knickerbocker's irresistible Chronicle of New York, has imputed a mythic interest to the bare early annals of his native city. It is thus that the writings of Washington Irving may be claimed to be imperishable till, what is not likely soon to happen, the same ever-welcome themes are treated in some happier manner. The charm of Irving is his acceptability to all—a grace and refinement to please the most fastidious; and his peculiar merit is readily appreciated by every reader; his good sense and humor, the air of enjoyment pervading his pages, have secured his works a home in both hemispheres, wherever the English language is understood. Of the few indispensable authors in every American library, Washington Irving is certainly among the foremost. The delight of childhood, the chivalric companion of refined womanhood, the solace of life at every period, his writings are an imperishable legacy of grace and beauty to his countrymen.

The new publications of these works will be in several forms of unusual elegance, and all, in proportion to a moderate price for each, combining good taste with economy. The series will be issued in the following order punctually on the first day of each month until completed, beginning with October.

Bracebridge Hall.	Astoria.
Wolfert's Roost.	Bonneville.
Sketch-Book.	Mahomet, 2 vols.
Traveller.	Granada.
Knickerbocker.	Salmagundi.
Crayon Miscellany.	Spanish Papers.
Goldsmith.	Miscellanies.
Alhambra.	Washington, 5 vols.
Columbus, 3 vols.	Life and Letters, 4 vols.

Three editions will be issued, namely:

1. THE KNICKERBOCKER (large paper) EDITION, on superfine laid paper, full size, 12mo, with illustrations. Elegantly printed and bound in extra crape cloth, gilt top. Price to subscribers for the whole set, $2 25 per vol.; half-calf extra, $3 75.

*** This edition will be sold only to subscribers for the whole set. It will be the best edition for libraries and for the centre table.

2. THE RIVERSIDE EDITION, on fine white paper, in 16mo. The whole set will be newly stereotyped in the same elegant manner as in the volumes already issued. These will be reissued and continued in monthly volumes until completed. Green crape cloth, gilt top, bevelled edges, $1 75 per vol.

3. THE PEOPLE'S EDITION. From the same stereotypes as the above, but printed on cheaper paper and neatly bound in cloth, price $1 25 per vol.

*** In this edition these favorite works are now presented in a readable and attractive shape and at a very moderate price.

*** The Sunnyside Edition is now published complete, in 28 vols. 12mo, cloth, price $2 50 per vol., or in half-calf, $4 per vol.

N.B.—The attention of the Trade is specially invited to these several editions. Enterprising Booksellers can readily take orders for whole sets, to be delivered in monthly volumes.

C. P. PUTNAM & SON,

661 Broadway.

"LEGIBLE, PORTABLE, AND CHEAP."

THE GLOBE BULWER.

THE GLOBE EDITION OF

BULWER'S NOVELS.

This Edition of the Novels of Sir Edward Bulwer Lytton, Bart., will be complete in twenty-two neat 16mo volumes.

Now Ready,

Each Novel complete in 1 vol.,

THE CAXTONS: A Family Picture.

PELHAM; or, THE ADVENTURES OF A GENTLEMAN.

EUGENE ARAM: A Tale.

THE LAST OF THE BARONS.

DEVEREUX: A Tale.

All the remaining volumes are stereotyped, and will be published in rapid succession.

Printed in large type, on tinted paper, with engraved frontispiece to each volume, and handsomely bound in green morocco cloth.

PRICE PER VOL. $1 50.

EACH NOVEL SOLD SEPARATELY.

For sale by Booksellers generally, or will be sent by mail, post-paid, on receipt of price by

J. B. LIPPINCOTT & CO.,

PUBLISHERS,

Philadelphia.

GERMAN BOOKSELLER,

24 Barclay Street, New York,

Regularly imports all the leading Foreign Publications, including Periodicals.

The following Catalogues of his large and carefully selected Stock may be had gratis on application:—1, General Catalogue; 2, Theological; 3, Philological; 4, Educational; 5, Scientific; 6, Medical; 7, Catalogue of Periodicals published in Germany, France, and England.

NO INTELLIGENT FAMILY

should be without the whole or part of the WRITINGS OF WASHINGTON IRVING, of whom Bryant prophesied a "deathless renown."

Complete sets, or separate series, or single volumes, from 75 cts. to $270. Send for price-list.

C. P. PUTNAM & SON,

661 Broadway.

Ancient Ballads and Broadsides.

JUST IMPORTED BY

SCRIBNER, WELFORD & CO.,

654 BROADWAY.

A Collection of Seventy-nine Black-Letter Ballads and Broadsides, printed in the reign of Queen Elizabeth, between the years 1559 and 1597. Accompanied with an introduction and illustrative notes. 1 vol. small 8vo, beautifully printed (only a limited number issued), cloth, $6.

*** The collections of Percy, Phillips, Evans, Ritson, and others are a convincing proof of the favor with which they have been received by the public. It may be confidently asserted that the present collection is not less interesting, and *is certainly much more curious*, than any that have preceded it, illustrating as it does the language, opinions, manners, usages, the feelings and passing events of the greater part of the reign of Queen Elizabeth.

These ballads are all of the highest interest and curiosity, hitherto unknown, and presumed to be unique.

The introduction and notes are supplied by two gentlemen profoundly versed in early English literature.

SCRIBNER, WELFORD & CO. HAVE ALSO FOR SALE

ENGLISH BALLADS.

The Robin Hood Ballads. Edited by GUTCH. 2 vols. 8vo, with 150 engravings. Cloth, $12 50. Scarce.

Book of British Ballads. Edited by S. C. HALL. Illustrated on every page. 1 vol. morocco extra, gilt edges, $30.

Percy's Reliques of Ancient English Poetry and Ballads. 3 vols. 18mo. A very pretty edition. Cloth, $3 75.

Early Popular Poetry and Ballads of England. Edited by W. CAREW HAZLITT. 4 vols. 12mo, cloth, $10.

Book of Roxburghe Ballads. Edited by J. PAYNE COLLIER. 1 vol. 4to, full morocco extra, $17 50.

Political Ballads of the Seventeenth and Eighteenth Centuries. Annotated by W. W. WILKINS. 2 vols. 12mo, cloth, $5; or in half-morocco, $7 50.

Ballads and Songs of Derbyshire. Edited by L. JEWITT. With Notes and Music. 1 vol. 12mo, engravings, cloth, $3 75.

Ballads and Songs of Yorkshire. Edited by INGLEDEW. 1 vol. 16mo, cloth, $3.

The Ballad Book. A selection of the choicest British Ballads. Edited by WILLIAM ALLINGHAM. 1 neat vol. 18mo, cloth, $2 25.

The Legendary Cabinet. A Collection of British National Ballads, ancient and modern. With Notes. By Rev. J. D. PARRY, M.A. 1 vol. crown 8vo, half-morocco, $3 50.

Early Ballads, illustrative of History, Traditions, and Customs. 1 vol. 16mo, cloth, $1 75.

FRENCH BALLADS.

La Lyre Francaise. Par G. MASSON. 1 vol. 16mo, cloth, $2 25.

Ballads and Songs of Brittany. 1 vol. 8vo, half-morocco, extra, $9.

Le Grand's Fabliaux. Translated by ELLIS. 3 vols. in 1, half-morocco, $12 50.

GERMAN BALLADS.

Cerman Ballads and Songs (in English). 1 vol. 16mo, half-morocco, $3.

Ballads and Poems from Goethe. By MARTIN. 1 vol. 16mo, cloth, $3.

Schiller's Ballad of Fridolin. Illustrated by RETZSCH. 1 vol. 4to, half-bound, scarce, $5.

IRISH BALLADS.

The Ballads of Ireland. Collected and Edited by E. HAYES. 2 vols. 12mo, full morocco, $10.

MODERN BALLADS.

The Book of Ballads. Edited by BON GAULTIER. 1 vol. 12mo, illustrated, cloth, $3 75.

The Bentley Ballads. Choice Ballads from Bentley's Miscellany. 1 vol. 12mo, cloth, $2 50.

Ballads and Songs. By DAVID MALLET. A new edition, with notes and engravings. 1 vol. crown 8vo, half-morocco, $4 50.

SPANISH BALLADS.

Der Cid, nach spanischen Romanzen besungen durch Herder. 1 vol., beautifully illustrated, half-morocco, $7 50.

RELIGIOUS BALLADS.

Old Religious Ballads and Carols. Edited, with Notes, by W. H. HUSK. 1 vol. 4to, half-morocco, $6 25; large paper, half-morocco, $15.

Coxe's Christian Ballads. 1 vol. 18mo, cloth, $1 50.

SCOTTISH BALLADS.

The Ballads of Scotland. Edited by AYTOUN. 2 vols. 12mo, cloth, $6.

A Book of Highland Minstrelsy. By Mrs. D. OGILVY. 1 vol. 4to, illustrated, cloth, $6.

Aytoun's Lays of the Scottish Cavaliers. 1 vol. 4to, finely illustrated, full morocco, extra gilt, $31 25.

NEW BOOKS.

GEORGE ROUTLEDGE & SONS

HAVE NOW READY

NEW EDITIONS OF

THE BROWN PAPERS. By ARTHUR SKETCHLEY. Reprinted from *Fun*. In which Mrs. Brown relates her visits to and her opinions—freely expressed—on The Royal Academy, The Derby, The Opera, The Dramatic Fete, The Franchise, The Old Bailey, The Emperor of the French, Domestic Servants, Housekeeping, The County Court, Society, Neighborly Visits, etc. 12mo, sewed, with fancy cover, 50 cents.

NEW EDITION OF

MRS. BROWN'S VISIT TO THE PARIS EXHIBITION. By ARTHUR SKETCHLEY, author of "The Brown Papers." In which Mrs. Brown records her views and experiences of the people she met and the places she visited, her haps and mishaps; and her true Cockney disgust at Mossoo's failings in the English language.

IN 2 VOLS. DEMY 8VO, EXTRA CLOTH, $12.

The Week.

THE retirement of "Binckley" into private life and Mr. Johnson's attendance at the Antietam celebration have made the week, as far as politics are concerned, unusually uneventful. We have had no reports, no dismissals or accusations or threats directed against anybody, though we believe the President still takes "the Constitution for his guide." The dismissed generals and General Hancock have, however, met at Washington, and have been received with extraordinary enthusiasm. General Sheridan paid the usual visit of ceremony to the "Chief Magistrate," as it seems now the settled fashion to call the President, but it was short and chilly. On Monday evening Sheridan, Sickles, and Hancock were serenaded. Sheridan made no speech to the crowd, but General Sickles did, vindicating in general terms his administration in South Carolina, and citing—though not by name—Governor Orr as one of his witnesses. Nothing, in fact, could be stronger than the governor's testimony, in his farewell letter to Sickles, to the good effects of military rule in maintaining order during the terrible ordeal through which the South is passing, perhaps the most trying through which any people has ever passed, being nothing less than a double revolution—a social one as well a political one. There is no example in history of any such change, much less of any such change being accomplished with so little disorder and so little abuse of power. The tirades which Mr. Johnson and his satellites have delivered on this subject have, then, been fully as remarkable as revelations of their ignorance as of their want of common sense. Ten years hence the onslaught on General Sickles for his policy in South Carolina will produce very much the same impression as Mr. Buchanan's demonstration of the illegality of suppressing the rebellion. When a community is being re-cast from top to bottom immediately after a bloody civil war, it is not the habeas corpus and trial by jury it wants, so much as security for life and limb—the consciousness that property and person are covered by the strong hand.

Quiet at the White House does not, however, mean quiet everywhere. The week has been marked by a number of unpleasant occurrences in private life. Senator Patterson, the President's son-in-law, has had a personal encounter with General Kyle, of Tennessee. The affair consisted of a slap in the face, a knock-down, an attempt to shoot, a reconciliation, and a drink. The proper newspaper heading of the affair would be "Difficulty in High Life." We are sorry to say, also, that we have had another outbreak between "H. G." and "T. W." The hopes we entertained that "H. G.'s" temporary removal to a wider sphere of usefulness at Albany would lead to a cessation of hostilities have not been realized. In the first place, "T. W." endeavored to fasten on "H. G." the responsibility of recommending Callicott, the hero of the great whiskey frauds, to the Government for the place he has disgraced. The result of this was that "H. G." was compelled to pronounce "T. W." and his aiders and abettors "immeasurable liars," meaning, of course, that their powers of mendacity were greater than our finite minds could grasp or comprehend, and not, as some absurd commentators have supposed, that the superficial area of their persons could not be computed. Smarting under this imputation, "T. W." published, in parallel columns, on one side a private letter of "H. G.," written to the President in confidence last year, strongly recommending General Steedman as Stanton's successor in the War Office; and, on the other, an article from *The Tribune*, published last month, strongly denouncing the said Steedman as the worst man whom the President could possibly select for the said office. The thing wears an awkward look; but it is not quite so bad as it seems, as it was quite possible for an honest man to think very well of General Steedman a year and a half ago and think very ill of him last month. He has done several things which show him to be utterly unfit for any place of responsibility just now, which he had not done when "H. G." wrote his letter. Our advice to "H. G." would be, however, to retire resolutely, and no matter at what sacrifice of feeling, from the business of recommending people for office, and devote the time and energy thus saved to the advocacy of Mr. Jenckes's Civil Service bill, and thus help to redeem the country from its greatest curse and canker—the filling of the public service with the nominees of editors and politicians as the reward of dirty job-work.

There have been various stories afloat about the desire of the President to have all the elections of the constitutional conventions at the South take place on the same day, and of his having visited General Grant, and urged his writing an advisory letter to the district commanders to that effect. The object of this is, of course, to secure a general postponement, as the day would have to be fixed with reference to the necessities of the State most backward in its registration. The only certain thing about the affair seems to be that both General Grant and the President are agreed that they cannot, if they would, interfere with the commanding officers in the exercise of their discretion. So the *elections* will be held in each State whenever the military authorities think it is time to hold them—no sooner and no later.

The cry for the payment of the five-twenty bonds in greenbacks has sensibly abated, owing to the sorry reception it has met with from the public. General Butler, as we have already mentioned, "explained" last week. This week Mr. Pendleton has "explained." What he wants is that the bonds should not be paid off in the greenbacks now in existence, inasmuch as this would convert a non-interest-bearing debt into one bearing interest, and thus increase the burdens of the country; that the Government connection with the national banks

should cease; and that the fresh greenbacks, which he needs for bond-paying, should only be issued gradually as the restoration of the South and the expanding industry of the country may call for them. The trouble is, that when you set about issuing an inconvertible paper, neither Mr. Pendleton nor anybody else can tell when there is as much of it in existence as the industry of the country requires. There is no measure, check, or standard of any kind to be had. When you issue too much convertible paper you receive notice of it by its coming back on you for redemption in coin. But you may issue inconvertible paper in any quantity, and while some will maintain that there is enough of it out, others will maintain there is not half enough, and the debtor interest will always urge you to keep on issuing; for the more you issue, the better they will be off. If there were so much of it out that, like the French assignats, a cup of coffee would cost a hundred dollars, the business of the country would, in the absence of any other medium, still be transacted in it. No honest man can go over this ground again, in view of the experience of the rest of the world, without feeling sad that in the United States, in the nineteenth century, it should be necessary to go over it at all. The sum and substance of the matter is that anybody who issues inconvertible paper till Mr. Pendleton and his followers cry "Hold, enough!" will swindle the poor just as effectually as if he sanded their sugar or put stones amongst their coal, and "there's an end on't." Governor Morton, of Indiana, has written an excellent letter on the subject, showing that the true way to lighten the national burdens is to lessen the taxes, and that this may be done not only without a diminution but with a positive increase of the public revenue, and denouncing all schemes for evading plain national obligations. As long as men of this stamp keep before the popular eyes "the more excellent way," we shall not fear the influence of the Butlers and Pendletons.

If anybody wants to know the natural consequence of trying to collect an enormously heavy tax upon a commodity in only too general demand by the aid of a revenue service filled with the tagrag and bobtail of party politicians, ignorant of their duties, and intent on feathering their nests during their short term of office, he has only to read the reports which now appear in the papers every day of the "whiskey frauds," as they are called in this city. The tax is so heavy that the premium on evasion is enormous; it pays distillers to run almost any risks to avoid payment; moreover, it pays collectors and inspectors to take heavy bribes. They have no character worth mention to lose. In the class to which they belong, hauls of this kind are not disreputable; the worst, judging by past experience, they have to fear from discovery is the loss of their situations—but they are sure to lose them anyhow, in the ordinary course of politics; while by being boldly corrupt they are sure of a snug little fortune, and increased consideration amongst their fellows. In the meantime, the consumption of spirits is not seriously, if at all, diminished by the tax. Its principal effect on the liquor is to cause its adulteration, and the morals of the country necessarily suffer even more than the liquor. All these effects of this tax are set down amongst the ascertained and well-settled facts of political economy in dozens of volumes. If legislators cared for the experience of mankind, which they do not, how much trouble we should escape!

There are in various quarters all over the country symptoms of opposition to the tendency in the Republican party, of which we spoke last week, to incorporate all sorts of schemes of reform in the party platform, and force them through under cover of the general devotion to the fundamental doctrine of equal suffrage. We have no doubt these indications will not be thrown away on the leading men of the party, but they will need to be more watchful than ever during the next session of Congress. There is the tariff, the eight-hour movement, the Fenian movement, the temperance movement, the greenback movement, all of which are trying to get a seat in the Republican car, but the burden of which would be more than the party could bear were it twice as strong. Its present business is to bring the South back into the Union under equal suffrage, and to see that the national credit is not impaired in the process of reconstruction. This done, the other things may be brought on, but not before. A "mass convention of the friends of morality, temperance, and religion" has been called at Rochester, Minn., which the St. Paul *Press* denounces as an attempt to break up the Republican party, the leaders in the movement being Copperheads, although the call is mainly directed to Republicans.

A propos of municipal reform, *The Evening Post* has been reiterating its doctrine that "the people" (*The Post* always means by this the numerical majority) "have a right to misgovern," and rebukes the Citizens' Association and everybody else for claiming the right to instruct "the people" on any subject. It is as well to repeat that this is one of the most immoral and detestable doctrines ever preached in a Christian country—that it is worse by far than the doctrine of the divine right of kings—that it claims for the numerical majority the right to disregard the moral law in its dealings with the minority—that it would, if sound, justify slavery or spoliation or any kind of baseness or corruption—that it is incapable of defence by any educated man, and contains a fallacy over and over exposed—that the promulgation of it at such a time and in such a community as New York City is likely to work mischief, and only mischief—and that, if such a creed were deliberately adopted by any democratic community, it would make democracy stink in the nostrils of every sober-minded friend of humanity. We, for our part, hold that all possessors of power, whether the Many or the One, are bound to use it in the service of justice; and that the right of a numerical majority to "misgovern" rests on precisely the same basis as the right of a band of brigands to rob a solitary traveller. We hope, too, the educated and intelligent and Christian minority of this city will not be deterred by talk of this sort from telling "the people" what they think, from asserting that they *are* wiser, *are* more enlightened, *do* know better what ought to be done, than the crowd which votes for Fernando Wood for mayor. That that crowd will work its way into more light through the exercise of political power may be true, but that it is the duty of journalists and preachers to keep it constantly advised of its ignorance, of its corruption, of its gullibility, and of its responsibility to God and man for the use it makes of its power, admits of no question.

Nobody seems to have paid much attention to the proceedings at Antietam the other day. We observe that the Charleston *Mercury* thinks "the services partook of a national and conciliatory character," and infers from the language of Mr. Johnson's speech that "the sentiment is becoming general that an honest purpose governed the action of both parties in the memorable conflict;" and *The Tribune* of this city printed in parallel columns Mr. Johnson's speech at Antietam and Mr. Lincoln's at Gettysburg—"the greatest speech of modern times." But, generally, the affair, so far as concerned the President's part in it, has been looked on as a piece of electioneering for the leadership of the great conciliatory party which is to appear in 1868—whether the Southern registration is reopened or not, we presume—and as such is looked on as a piece of futility not worth mentioning.

One of the most recent Democratic discoveries is recorded in the Memphis *Avalanche*, which reports, on the authority of "several responsible gentlemen," that on several different days they had seen, at a certain point of a certain railroad, from ten to fifteen cars filled with blacks from Alabama, Georgia, South Carolina, and Southern Tennessee, all on their way to Ohio to vote. On being examined by "the responsible gentlemen," these colored persons said they were sent on by the Freedmen's Bureau, and they were "to vote as they were told." "This," *The Avalanche* sensibly remarks, "is a fair specimen of the way in which the people's money is squandered by the reckless Radical politicians." It certainly is disgraceful to spend so much money collecting blacks all over the South to vote in a Northern State where they are denied the suffrage, when the judicious expenditure of half the sum would have procured twice as many cart-loads of white men

in the Eastern cities, each man good for at least two votes, and some for four.

Several causes were at work to ensure the severe defeat which the Confederationists have just experienced in Nova Scotia. Most Nova-Scotians have the smallest possible degree of confidence in the politicians who have for many years controlled the Canadas, and who, in all probability, are hereafter to control the maritime as well as the inland provinces. Then the ordinary Nova-Scotian—if he is hardly what a Yankee calls a very enterprising person—is by no means a profuse or extravagant person, and has no relish for seeing the surplus revenue of Nova Scotia taken to supply the chronic deficit in the Canadian treasury. Finally, and most cogent of them all, is this reason for opposing confederation: that a legislature, elected before confederation had been seriously talked of, coolly settled the question for their constituents without submitting it to the people. This action the people have resented by sending an almost unbroken delegation of anti-confederates to Ottawa, only two of the nineteen confederate candidates having been returned. The result of the election is a spirited assertion of the right of popular government.

General Escobedo has written a remarkable letter to Mr. Romero, the Mexican Minister in Washington, or rather, Mr. Romero has done a remarkable thing in publishing it. The general says that all he did in Mexico was done in obedience to the orders of his Government and for the good of his country, and thanks Mr. Romero for denying the stories in circulation about him here; but, awkwardly enough for his friend Mr. Romero, he cautiously refrains from saying whether these stories were true or false. M. Escobedo is not the only person in the world who would be much indebted to his friends for denying what the world says about him. There is just now a visible *rapprochement*, as the French say, between the leading Mexicans and this country, which may or may not have something to do with the fact that they are about to put a loan of fifty million dollars on this market. If anybody wants to get an idea of the moral condition of the country, he has only to read the account of the execution of General O'Haran the other day. The men who authorize such spectacles, in a time of profound peace, do not deserve a footing even on the markets of any civilized country. Should the money be raised, we shall have a crucial test of the solidity of the present tranquillity. If the other "chiefs" can stand by and see the Juarez party spend such a sum, they must have made prodigious advances in civilization during the late war, and the French may fairly claim part of the credit of it.

The political future in Europe remains as uncertain as ever. Capital continues to flow home to the banks, which are now groaning with it; fortifications continue to be strengthened, new guns invented, while the French and German press keep up the courage of the fighting men by Homeric defiance and abuse. Of the New York *Tribune's* immediate war in the Mediterranean we hear nothing more The Russians are probably getting another "ultimatum" ready for the Turks. Two "ultimatums" will certainly bring the Sultan down, but if they do not we recommend the application of a third; and if this does not do, Russia ought, for the sake of her own credit, to declare war against him whenever the fighting begins all over Europe, or at some other remote and indefinite period.

About the effect of the Salzburg conference on Germany, however, there seems to be no doubt. It has, beyond all question, ripened the South German leaning towards Prussia. The Grand-Duke of Baden's speech, the other day, revealed clearly the immense progress which the Southern states have made towards unity under Prussian leadership in consequence of the apparent leanings of Austria to France. One other consequence will unquestionably be—we might say, is—as we have more than once pointed out, a closer alliance between Prussia and Russia. That this is rapidly growing up is now generally admitted, and the Panslavist movements in Austria and Turkey, directed, as they doubtless are, from St. Petersburg, point to a great convulsion in Eastern Europe whenever France and Prussia come to blows.

In England there is nothing very new or striking. The newspapers are still trying to peer into the darkness of the political future, and make out, if they can, what kind of England the householders are going to make of it. The probabilities are that their predictions, especially the dismal ones in which a portion of the press is indulging, will suggest far more sweeping changes to the new voters than they would otherwise have thought themselves capable of bringing about. One or two things, however, all parties acknowledge to be doomed, without hope of respite or reprieve. One is the Irish Church, and the other the present military system. Both are monstrosities. Governor Eyre, as if to fan the flame of opposition, has just been fêted by the officers of the garrison at Dover.

The "International Working-men's" Congress has had its second meeting at Lucerne, in Switzerland, but the proceedings were not marked by much ability or practical sense. The difference of language amongst a body of men who are rarely acquainted with any language but their own, and the ignorance of the French and other Continental delegates of the rules of proceeding in deliberative bodies, or, in fact, of the necessity of any rules at all, caused incessant confusion. The questions brought up for debate were the relative position of men and women in industry; the probable effect of the trades unions on the condition of the whole working class—whether they will not create and foster a grade of poorer working-men; the value of political enfranchisement as an aid to social enfranchisement; and others of less importance. The principal feature in the debate which followed was the struggle of the chairman to keep the French delegates from exercising the right to "*parler indéfiniment*"—a faculty which was, in the old Revolutionary days, the proud boast of Bernard "le Clubbiste," as he was called, who was afterwards tried in London for conspiracy against the Emperor, and defended by the well-known Mr. Edwin James.

Garibaldi does not seem to be growing wiser as he grows older, and his two attempts against Rome have destroyed his influence with all the more sober-minded of his own countrymen. The last one, apart from its involving the arrest of Garibaldi by the Italian Government, is more foolish than the first. The French troops were withdrawn from Rome under an impulse which the French Emperor probably regretted as soon as he had signed the convention, and his changed position in Europe and changed feeling towards Italy as a possible ally of Prussia in future complications, render him probably only too glad of an opportunity of going back again. If the despatch of yesterday, announcing the return of the French troops to Rome, be true, it is a great misfortune for Italy, and Italy owes it to Garibaldi's want of good sense. Whenever Italy gets out of her financial difficulties, and is able to turn a bold front to Europe with a full treasury behind her, Rome will surely fall into her hands. Every hour tells against the Papacy. It has lost Austria, and, in fact, may be said to have lost Catholic Germany; and intelligent Catholics are gradually reconciling themselves to the idea that the Church may continue to flourish even if its chief bishop does not hire fighting men.

The insurrection in Spain has been suppressed and the executions have begun. There is hardly a city in the kingdom, according to the latest reports, in which wholesale shootings are not going on under the direction of courts-martial. The Spanish branches of the "Latin race" seem to be in a bad way, and there appears to be no immediate hope of improvement. In Spain the army is just strong enough to put down insurrection, but not strong enough to keep order, and the degeneracy of the aristocracy and the absence of a middle class have left the army the only governing power. The worst of it is that the people, while brave and martial enough to make foreign interference impossible, are not capable of pulling down the military régime. The chances are that Spain will run the course of Mexico, and perhaps not come out as well in the end.

Notes.

LITERARY.

MESSRS. NICHOLS & NOYES, Boston, will publish, early next month, "The Sexuality of Nature," by Leo H. Grindon, author of "Phenomena of Plant Life," etc. They also announce for publication by subscription a large-paper edition of Samuels's "Ornithology and Oölogy of New England," with entirely new drawings, colored from nature, and promise that "no pains or expense will be spared" in thus producing the new volume.——Mr. H. B. Fuller, Boston, has in press Theodore Parker's writings, in fourteen volumes, new edition; volume second of "Lectures and Annual Reports on Education," by Horace Mann, uniform with his "Life;" "Memoir of Rev. Mr. Conant," by Rev. Robert Collyer; "Joseph in the Snow," by Berthold Auerbach; "Morning Glories, and other Stories," by Miss L. M. Alcott; "Fairy Bells, and What they *Tolled* us," by Miss Lander.——Messrs. Leypoldt & Holt have in press "The Interference Theory of Government," by Charles Astor Bristed, a little work of some hundred pages, of which it is not difficult to guess the contents.

—The firm of Mohun & Ebbs, favorably known to our book-buyers for its importations of rare and valuable works, especially illustrated, large-paper, and otherwise fine editions, having recently dissolved by limitation, the junior partner, Mr. Allen Ebbs, has removed to 183 Broadway, and continues the business with an entirely new stock of books. Turner's "Rivers of France," folio, Sir Thomas Lawrence's "Portraits," the fifteen volumes of the "Museo Borbonico," the volume of engravings of Thorwaldsen's works, produced at the expense of the Danish Government, proof plates of the illustrations to "Waverley," Doré's designs complete, are among the more striking portions of Mr. Ebbs's present collection.

—At the late meeting of the British Association for the Advancement of Science, the Earl of Buccleuch, president for the year, paid a tribute to the late Prof. Faraday, who has been called the greatest discovery of Sir Humphry Davy. The London correspondent of the New York *Times*, recalling this saying, remarks that "Davy was himself the discovery of a greater man, in my opinion, than either of them—Count Rumford." It is really true, and it is a curious link between the Old World and the New, that Davy owed his promotion to the professorship of chemistry in the Royal Institution, if not directly to Benjamin Thompson—originally of Woburn, Massachusetts, later of Rumford (Concord), New Hampshire, later still of Munich, etc.—at least indirectly, as the founder of the Institution. A small percentage of the American people have heard of Count Rumford as the founder of a professorship in Harvard College, but few know that he was an American, and that he probably excelled Franklin as a physicist. In fact, these two men were distinguished for their researches in heat, light, and electricity, the correlation of which forms the most brilliant chapter of scientific discovery within the memory of the present generation; and Rumford's enquiry into the nature of heat, and his experiments tending to identify heat with motion, are now looked back upon with respect by Tyndall, Grove, and their co-laborers. By his correction of smoky chimneys, and discovery of the true theory of draughts, the count contributed to the comfort of millions, and secured the universal use of coal for domestic purposes. As a statesman, he was to Bavaria, on a smaller scale, what vom Stein was to Prussia.

—The influence of the old nations on the North by commerce is the subject of a recent work in Swedish, by Mr. C. F. Wiberg, now published in a German translation. ("Der Einfluss der klassischen Völker auf den Norden durch den Handelsverkehr." Hamburg. 1867.) The influence of the Phœnicians on the culture of the Scandinavian North during the bronze age was sought to be established by Professor S. Nilsson, in his work on the "Aboriginal Inhabitants of the Scandinavian North;" but Mr. Wiberg only partially corroborates his views. The Phœnicians, attracted by the mineral wealth of Spain, especially its tin and silver, early settled there, and in 1100 B.C. founded *Gadir*, the modern *Cadiz*, as is proved by remains of buildings, discoveries of coins, instruments, monumental inscriptions, etc., and by the Phœnician impress on the language and culture of the Iberians. There is testimony and proof that they reached the south coasts of Britain; but Mr. Wiberg dissents from Professor Nilsson's opinion that they visited the more northern waters. That Gaditanian and Carthaginian navigators had passed through the Channel into the North Sea, and had traded in amber, is not quite impossible, but cannot be satisfactorily proved, as there is no tradition about it, nor has there been any discovery of Phœnician remains in western and northern Europe. According to Mr. Wiberg, the style and uniformity of the bronze weapons found in Germany and Scandinavia are quite Etruscan, and in many cases point to a mechanical origin, by casts which are found in Italy, unlike the Phœnician, and evidently of Etruscan origin. The line of these discoveries follows the great commercial highways from Italy over the Alps, along the Rhine, and thence to the north; also in Eastern Germany following the Danube. The amber trade of the North with the Greeks was inaugurated in 325 B.C. by Pythias of Massilia (Marseilles), who circumnavigated the Atlantic coast, and found his Thule, as Mr. Wiberg surmises, in Jutland. A Greek-Scythian colony at the mouth of the present Bug and Dnieper prosecuted an amber trade with the Baltic by means of the latter river. The Romans also came overland as early as 361 B.C., as is shown by coins found in Scandinavia. For amber they exchanged instruments, weapons, gold and silver coins, etc.

—An unperformed opera of Meyerbeer's, called "The Youth of Goethe," the performance of which was forbidden in his will by the composer, and which his widow, with due regard to this circumstance, had kept back, is the subject of a lawsuit on the part of M. Blaze de Bury, who wrote the text for it, of course under promise of compensation. He now demands the performance of the opera in order to get his *tantième*. Most admirers of good music will hope that he may win.——Among recent recipients of the Cross of the Legion of Honor was Mr. Spiers, professor of English at the École des Ponts et des Chaussées, and well known to school-boys as the author of the best popular French and English dictionary now in use.——A leaf from practical theology is a work just published in France, of which Dr. E. Verrier is the author: "Of Infant Baptism in case of Danger," which treats especially of intra-uterine baptism and the instrument to administer it.——Didier (Paris) publishes M. Pellissier's history of "The French Language from its Origin to the Present Day," in its formation and progress, embodying the latest results of philological investigation.

—An Austrian political economist, Dr. L. Stein, of Vienna, has published a hand-book of public administration, the last part of which, treating of public health, has just appeared ("Die innere Verwaltung. III. Theil. Das öffentliche Gesundheitswesen in Deutschland, England, Frankreich und andern Ländern. Von Dr. L. Stein." Stuttgart. 1867). The regulation of the public health is divided by the author into two departments, the preventive, or sanitary, and the remedial. The first embraces the restriction of epidemics, that put upon markets, quack and patent medicines, burials, buildings, the labor of juveniles, and on contagious diseases; the second governs the persons engaged in the healing process, physicians and apothecaries, and also the public health institutions, hospitals, asylums for the insane, etc., etc. In France and Germany the governmental administration of the public health is regarded as almost perfect, and likewise the supervision and restriction of physicians and druggists. Without the study of medicine for not less than four years, hospital practice of one year, and a doctor's examination, nobody in either of these two countries is admitted to practice. In England no formal examination is prescribed, and the acquisition of the doctor's degree is free. Nine medical corporations in that country are exclusively entitled to have their fellows and licentiates acknowledged as physicians. The only security against incapacity is given by the registration of those physicians in a medical register, subject to the General Council of Medical Art. In France, Holland, and Germany apothecaries are only admitted to make prescriptions after several years' study of pharmacy and an examination. Drug-stores are subject to regular visitations and the sale of patent medicines is prohibited. In England there is no legislation about this matter.

—*Trübner's Literary Record* for Sept. 2 contains a translation of the preface of a Parsee gentleman, residing in London, to *his* translation of Sir John Malcolm's "History of Persia" into the Guzerati language. Jamshedjee Pallonjee has largely annotated the original work, and illustrated it with twenty engravings and a portrait of the leading European Zend scholars. He enumerates eight conclusions to which he has arrived and which he endeavors to establish in his introduction. He agrees with Bunsen as to the time of the early Aryan separation, and in fixing the age of the prophet Zoroaster at 3500 B.C. The primitive abode of all the Aryans in the pre-historic period was somewhere near the North Pole, a decided change of temperature having since taken place in that region. The Semitic and the Aryan history should be treated independently of each other; as the Bible treats of the Semitic people only. "In the history of mankind, as a general rule, one Aryan nation is not destroyed by another Aryan nation, but by the Semitic or Turanian nation only, and *vice versa*. Generally speaking, the Aryan is an original or inventive mind, the Semitic a copying or receptive mind."——Some of the recent publications of Trübner

& Co. are, "The Dervishes; or, Oriental Spiritualism," by John P. Brown, U. S. Secretary of Legation at Constantinople; Alexander Melville Bell's "Visible Speech; the Science of Universal Alphabetics," or, self-interpreting physiological letters for the writing of all languages in one alphabet, illustrated by tables, diagrams, and examples; "A Hand-Book of Modern Arabic," being a practical grammar, with its examples, etc., in European type, by Prof. F. W. Newman.

ERRATUM.

In our article on "Mr. Longfellow and his Critics," in our last number, the name "Blane" *should have been printed* "Blanc."

THE ART OF LIVING.*

A WRITER of considerable acuteness, in one of the Irish papers, has lately been maintaining that we need an additional profession, the business of which should be simply and solely to point out to each man, after a proper investigation of his antecedents, attainments, and mental and moral qualities, in what calling he should engage. This conclusion has been reached after long and painful observation of the tremendous blunders which lads make every day in selecting their walk in life. The ministry swarms with men who would have made good lawyers and soldiers; the bar with men who would have made excellent merchants; commerce with men who would have done better as professors, and so on. In old societies these mistakes are almost irretrievable. They are not usually discovered until a man has fairly settled down to his work for good or evil, or has grown too old to make change possible. In this country, where the social organization is less fixed, men make more frequent attempts to correct early errors by abandoning the calling once taken up and going into others; but even here change is difficult, and, when made, it is often unsuccessful. Even if the person happens in the second attempt to hit on his right vocation, the mere act of changing—the feeling that, having once made a mistake, he may make another—is apt to unsettle him permanently, and convert him into one of those versatile mortals who are "everything by turns and nothing long," and who, after a life of failures, sink into an embittered and unhappy old age.

There is probably no more prolific source of misery than these mistakes in choosing a vocation, and they cause great loss to the community. The waste in productive power, of having men spending their lives in trying to do one thing when they are better fitted for some other, is, of course, immense. If we could only hit on some scientific method of dropping men into their proper places at their entrance on active life, we should not only greatly increase the sum of human happiness, but make a great addition to the national wealth. Whether we should be any better off if we had a body of men set apart for this very business, as the Irish writer suggests, may be doubtful. Whether there be any considerable number of persons in existence possessing the necessary qualifications for it, may be questioned; but even if there be, there is no means of discovering them—a fatal and irremediable defect in the scheme. Who could answer for the fitness of those who are to pass upon the fitness of others?

As matters stand, boys either drift into their callings on the current of circumstances or they are put into them by parents who have probably either made little or no study of their taste or bent, or else try to force them to adapt themselves to some favorable opening. A father may be satisfied that his son would make a good lawyer, but he finds he can get him into some mercantile house of high standing on favorable terms; or he knows that his bent is literary, but just then he cannot well afford to send him to college, and so on. In a still greater number of cases, the boy's character not being formed, and no special bent having developed itself in him, he is guided in the choice of a pursuit by some accident of his position. He has a schoolfellow engaged in it, who describes it in glowing terms, or there is some incident of it which strikes his fancy. He turns merchant because he sees that wealthy merchants live in fine houses and keep fast horses; or goes to the bar because he sees that a good many lawyers are very famous and highly honored; or he becomes a clergyman from an admiration of pulpit eloquence, or from a desire to be "interesting" to women.

This being the case—mistakes being apparently not preventable—social philosophers have devoted themselves mainly to showing men how to reduce their bad consequences to a minimum; that is, to instructing people how "to make the most of themselves," as it is called, no matter what walk of life they may have chosen. The demand for this sort of instruction is insatiable, if we may judge from the number of books, of greater or less pretensions, such as those whose titles we give below, which pour from the press every year. They rarely seek to guide men in choosing their calling; they suppose it already chosen, and then supply general maxims which will be likely to be of use in any calling, showing the mental and moral habits and other conditions necessary for general worldly success. The kind of teaching they supply is, in fact, very much like that which the Sophists gave young men in ancient Greece. In our day, the field of intellectual knowledge has become so enormously extended that educators of youth are almost forced to confine themselves to giving the pupil a tincture of science and literature. The moral training, training in the art of living, of being useful, of being agreeable, in the proper regulation of his relations to his fellow-men, is left to the parents, and only a small minority of these are competent for it, or devote much attention to it; hardly any give it systematic attention; so that nearly all the instruction young people get in the social art they get imperceptibly, unconsciously, from the social and family influences under which they live. Occasionally their character is affected by the church to which they belong; and sometimes, but only very rarely, ministers try to deal with social problems for the benefit of the young; but ministers are apt to be ill-fitted, both by education and position, for any such work.

The Sophists, on the other hand, had very little scientific or literary knowledge to communicate. When they had taught their pupils a little astronomy, a little geometry, and a little arithmetic, their store was exhausted. They had no body of literature through which to carry the pupil, so they devoted themselves mainly to his instruction in his interests and duties as a member of a civilized community—in other words, taught him to "think and speak and act" as a citizen, father, brother, son, or Greek; how to express himself correctly and effectively; how to bear himself gracefully and harmoniously; in short, the qualities of mind and body he needed to cultivate in order to be of value to the state and to his family. We need not ask how much of all this a youth learns in our schools and colleges. His whole time up to the moment of entering on the active duties of life is devoted to acquiring scientific or classical information. All the direct moral or æsthetic education he gets is derived from occasional parental admonitions or stray scraps of wisdom communicated by teachers or professors in an address on some solemn occasion. We have, of course, chairs of moral philosophy, but the instruction communicated in them is apt to be made as scientific as possible, and kept as far as possible from application to actual life. When a boy, launched on the great sea, and brought face to face every day on rising with difficulties of all kinds, wants to get at the secret of ordinary worldly success, wants to find out what implements he must most use, what defects in himself he must correct, what he needs in order to be agreeable in circles in which pleasure and profit are to be sought, what dangers he runs in trying to make his place as a social being in what is called the "world"—wants, in short, to command the experience of men who have been through the process and succeeded in it, he has to purchase one of the dozens of little books whose number is swelled every year, many of them trashy, many more foolish, and many more misleading, but all aiming to do in an irregular way what ought to be done regularly in education. He gets through this channel, for the most part, advice on dress from some of the worst-dressed men in the country, on manners from some of the greatest clowns, on mental culture from men whose minds are a mass of confusion, and on the art of conversation from bores whose appearance in private life puts young and old to flight.

One of the little books before us—Dr. Hart's "Mistakes of Educated Men"—is a commentary on the seven great maxims: Take care of your health; form the habit of being beforehand with your work; hold on to the calling or profession you have chosen; have some fresh intellectual acquisition always on hand; do not limit your studies to your own specialty or your intercourse to your own particular sect or caste; cultivate the art of conversation; cultivate good manners. We have rarely, if ever, met in this species of literature with more good sense, good feeling, knowledge of the world, and comprehension of the means of succeeding in it, within the same compass; and though we have never lighted on it before, we are glad to see that this is the fourth edition. Of course it touches everything lightly, and contains very little that is new or striking; but on a subject on which so much is to be said, and on which so much has been said, perhaps a teacher exhibits his sagacity and tact in no way so well as in making a good selection of the advice he offers. Dr. Loomis's book is a more pretentious performance, being "a text-book for schools and academies;" but hardly so successful. The author, or rather compiler—for a considerable portion of it is taken from Dr. Watts's "Improvement of the Mind," and more from "Chesterfield's Letters" and other works—perfectly well understands, however, the want he seeks to supply. He says very truly that, on the ques-

* "Mistakes of Educated Men. By John S. Hart, LL.D." Fourth edition. Philadelphia: J. C. Garrigues. 1867.
"Mental and Social Culture: a Text-Book for Schools and Academies. By Lafayette C. Loomis, A.M., M.D." New York: J. W. Schermerhorn & Co. 1867.

tions of "how the mental faculties may be best developed and strengthened, what is the most successful mode of study, how shall I learn the principles of politeness and personal accomplishments, of rendering myself agreeable, instruction has been greatly neglected;" and that, "with no word of counsel in his whole course of instruction, the youth is expected to develop himself for mental success and social excellence." But Dr. Loomis is hardly in a position to supply the need himself when he supposes that Dr. Watts is a good instructor on such subjects for the young men of our day. Nobody who understands his age would embody such wisdom as the following in a manual of "Mental and Social Culture":

"He that would raise his judgment above the vulgar rank of mankind, and learn to pass a just sentence on persons and things, must take heed of a fanciful temper of mind and a humorous conduct in his affairs. Fancy and humor, early and constantly indulged, may expect an old age overrun with follies."

Or such as this:

"In order to furnish the mind with a rich variety of ideas, the laudable curiosity of young people should be indulged and gratified rather than discouraged. It is a very hopeful sign in young persons to see them curious in observing and inquisitive in searching into things that occur; nor should such an enquiring temper be frowned into silence, or rigorously restrained, but should rather be satisfied with proper answers."

NEW THEORIES OF CONSTITUTIONAL LAW.*

THIS is an ingenious and elaborate effort to demonstrate, by a course of legal argument, that the Federal Constitution has been misconstrued ever since it was established, and that, properly interpreted, it abolished slavery, destroyed the last vestige of State rights, consolidated the whole power of government in the hands of federal authority, and carried out the doctrines of Hamilton to an extent of which Hamilton himself did not dream.

Such a line of argument cannot, of course, be supported by judicial authorities, for it is in direct opposition to the views of every tribunal that has administered justice in this country since 1787. A few cases are cited by way of illustration, or to strengthen collateral branches of the argument; but evidently no great importance is attached to them.

The keystone of Judge Farrer's theory is to be found in the preamble or enacting clause of the Constitution: "We, the people of the United States, in order to form a more perfect union, establish justice, ensure domestic tranquillity, provide for the common defence, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution of the United States of America." This clause, in our author's opinion, confers powers and duties upon the Federal Government commensurate with the objects thus declared, and upon the widest interpretation of their meaning. It needs no explanation to make it clear to any one that this doctrine would give to the Federal Government all the power that any government ever had, subject only to the specific checks and restraints imposed by subsequent clauses of the Constitution itself. Whatever any State might do, the United States could do; and the latter power might go further, and, assuming all the powers of local government now exercised by the several States, might prohibit them from exercising any authority whatever. Such is Judge Farrer's conclusion (§§ 120–122); and he could not stop short of this, reasoning from his premises.

This position is fortified by reference to Section 8 of Article I. of the Constitution, by which the whole nature of the government seems to be involved in a question of punctuation. That section begins thus: "Congress shall have power to lay and collect taxes, duties, imposts, and excises; to pay the debts and provide for the common defence and general welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States." It is evident that the meaning of this clause depends very much upon the use of the semicolon where it first occurs. The Republican party of 1800 maintained that this semicolon had no more effect than a comma; the Federalists insisted that the use of a semicolon separated the two parts of the sentence as effectually as if they had been divided into paragraphs and numbered. If the latter view were correct, the power to provide for the general welfare would be an independent one, of unlimited scope; if the former were the just view, this power would be a mere incident of the taxing power, and could at the utmost only be exercised by raising and appropriating money. Judge Farrer, of course, magnifies the office of the semicolon.

The power of Congress being thus established as supreme, the "security of liberty" abolishes slavery, and the "establishment of justice" abrogates everything that is unjust. The section concerning the apportionment of representatives Judge Farrer explains by assuming that "persons" means "citizens," that "all other persons" must mean citizens bound to service otherwise than for a term of years, because "bond" is the opposite of "free," and "bond" implies some contract or obligation, which cannot exist in the case of a slave (§§ 139, 140).

The amendments to the Constitution, forbidding seizures and searches without warrant, prosecutions without indictment, etc., etc., are confidently assumed to be limitations upon the States as well as upon the Federal Government, and one decision, by Chief-Justice Spencer, is cited to that point. But surely the author must be aware that the contrary doctrine is well settled, if anything can be settled by judicial interpretation.

We shall not follow Judge Farrer through the rest of the argument by which he proves to his own satisfaction that Congress has power to do anything; that the United States courts have jurisdiction over every possible controversy; that the States are mere municipalities; and, in short, that the Constitution has never been understood or expounded heretofore with the slightest approach to correctness. We respect his motives, but cannot sympathize with either his objects or his method of attaining them. We do not think that justice would be more effectually administered, the happiness of the people increased, or the perpetuity of the Union more assured by a consolidated government than by the system which now exists. Even if we did, we could not justify ourselves in putting a meaning upon the words of the Constitution which we all know was not attached to them by a single man who helped to frame it, who voted for it, or who advocated it in public or in private. No instrument could endure such a mode of interpretation as is applied to the Constitution by this book. No confidence could be placed in any man's word, or in any of the bonds which hold society together, if such total disregard of precedent, and such amazing ingenuity in explaining away language or torturing it into meanings of which its authors never dreamed, should become general. Liberty and justice can rarely be founded upon hairsplittings.
